Add to such by-products of foreign missions the direct fruits of missionary effort in endowing illiterate languages with alphabet and writings, in purifying literary thought and expression in languages which already have literature, in enlightening womankind, hitherto guarded against culture, in training children and youth, in teaching an industrial efficiency which touches the world's commercial interests, and one gains fuller comprehension of the results of foreign missions. This vast enterprise so reaches the source of social development among those masses with whom is the reserve vitality of every nation that it must be reckoned among the great agencies by which Europe and America are shaping the destinies of backward races throughout the world.

The outbreak of the World War in 1914 created a reaction against Christianity throughout the mission fields of the world which prevailed until the East understood that the British Empire, and later the United States, were both fighting for justice and righteousness and for the rights of unprotected humanity. German foreign missions naturally suffered during the defeat of the nation which had violated a fundamental principle of Christianity, "Peace on Earth—Good will to men," and the interdenominational, international missionary organizations which reached their culmination at the Edinburgh Missionary Conference in 1910 were, for the time, disorganized. The continuation committee there launched had been remarkably successful in binding under one organization the Protestant missionary forces of the world.

By the stand of the British Empire and America, North and South, a reaction occurred which increased the endeavors of Protestant reign mission work as shown in the statistics presented at the Foreign Mission Conference North America at Garden City, N. Y., in 1918. Gratifying increase was shown along all lines of foreign missionary endeavor and was best exemplified by the grand total of the incomes of the affiliated societies, representing as far as it was possible to be ascertained the amount given in Canada and the United States for carrying on foreign Protestant missionary enterprise. Of the total amount, \$18,500,000 were given by living donors, a balance of nearly 2,000,000 representing the incomes from legacies, endowments and other sources. Exclusive of the income of the societies derived from the mission fields themselves, the total income amounted to \$20,400,000 as compared to \$16,397,41 in 1915 and \$11,946,218 in 1910. Officially advanced by the National Missionary Society of Sweden in a communication to Secretary James L. Barton, chairman of the American National Committee, representing the mission societies of North America, the suggestion is to be acted upon, although many difficulties appear in the way of the achievement: Whether plans should not be inaugurated by the Protestant missionary bodies of the world to put all foreign work upon a supernatural basis so that in case of any future war, no

matter what countries were involved, their institutions and their work should remain absolutely undisturbed?"

Bibliography.—The literature of foreign missions is enormous. Only a few standard works can here be suggested. Dr. S. M. Jackson's (*Bibliography of Foreign Missions*) (1891) may well be consulted. *General Surveys and Statistics*: Warneck, (*Outlines of a History of Protestant Missions*) (1907); Dennis, (*Centennial Survey of Foreign Missions*) (1902); (*World Atlas of Christian Missions*), Student Volunteer Movement (1917); Bliss, E. M., (*Encyclopedia of Missions*) (2 vols., 1891); Dwight, Bliss and Tupper, (*New Encyclopedia of Missions*) (1904); Dwight, H. O., (*The Blue Book of Missions*) (1907); Barnes, L. C., (*Two Thousand Years of Missions before Carey*) (1901). *Missionary Societies*: Lovett, R., (*History of the London Missionary Society*) (2 vols., 1895); Stock, E., (*History of the Church Missionary Society*) (3 vols., 1899); Hamilton, L. T., (*Moravian Missions*) (1901); Pascoe, C. F., (*Two Hundred Years of the Society for the Propagation of the Gospel*) (1901); Merriam, E. F., (*History of the American Baptist Missions*) (1902); Strong, W. E., (*Story of the American Board of Commissioners for Foreign Missions*) (1910); Canton, (*History of the British and Foreign Bible Society*) (5 vols., 1904); Dwight, (*Centennial History of the American Bible Society*) (1916); Report of the Centenary Missionary Conference (London 1888); Report of the Ecumenical Conference (New York 1900); Reports of the World Missionary Conference (Edinburgh 1910); Dennis, (*Christian Missions and Social Progress*) (3 vols., 1897-1906). *On Special Fields*: Reports of the great Shanghai Conference (1907); MacGillivray, (*China Missions' Year Book*) (1915); Gibson, (*Mission Problems and Mission Methods in South China*) (1893); Inglis, (*India's Protestant Missionary Directory*) (1915); Jones, (*India's Problem*) (1903); Dearing and others, (*The Christian Movement in Japan*) (1915); Stewart, (*Dawn in the Dark Continent*) (1903); Stock, (*The Story of Uganda*) (1894); Curtis, (*The Laos of North Siam*) (1903); Brown, (*The New Era in the Philippines*) (1903); Beach, H. HENRY O. DWIGHT,
Author of 'Blue Book of Missions,' etc.

MISSIONS, Protestant Home. Home missionary effort in the United States is older than its organized form. Before the War of the Revolution individual churches in New England and New York were sending their pastors, for weeks or months at a time, into the new settlements, to preach the Gospel and administer the ordinances of religion. Connecticut pastors received for this service \$4 a week, and \$4 more were allowed for the supply of their pulpits, the money being raised by voluntary subscriptions among the home churches. These

desultory efforts continued more or less intermittently for 25 years; they were warmly welcomed by the struggling settlements and were influential in preparing the way for better organized endeavors.

Organized American home missions began with the establishment of the "Missionary Society of Connecticut," 21 June 1798, by the Congregational churches of that State. Massachusetts Congregationalists followed one year later, 1799, with the "Massachusetts Missionary Society." Both of these Societies, bearing the names of the States where they originated, and supported by the States whose names they bear, were not primarily for the benefit of Connecticut and Massachusetts. The object of the Connecticut Society, as stated in its charter, was "to Christianize the heathen (Indians) of North America and to support and promote Christian Knowledge in the New Settlements of the United States." The charter of the Massachusetts Society describes its object as being "to diffuse the Gospel among the heathen (Indians) as well as other peoples in the remote parts of our country." Both Societies, therefore, while local in their origin and support, were truly national in spirit and aim. Other New England States followed the lead of Connecticut and Massachusetts in organizing similar societies; New Hampshire in 1801; Rhode Island in 1803; Maine and Vermont in 1807, all of them under Congregational auspices. They all continue to the present time with but slight changes in name, and with increasing devotion to home missions, State and national. The first organized movement on the part of the Baptist churches was made in 1802, when the "Massachusetts Domestic Missionary Society" was established at Boston, with the same broad object as its Congregational predecessors, namely, "to furnish occasional preaching and to promote the knowledge of evangelistic truth in the new settlements of these United States, or further, if circumstances should render it proper." To the same year 1802 belongs the first systematic effort of the Presbyterians of New York, Pennsylvania and New Jersey, acting under the same broad charter with those of the Congregationalists and Baptists of New England; "to send forth missionaries well qualified to be employed in mission work on the frontiers, for the purpose of organizing churches, administering ordinances, ordaining elders, collecting information concerning the state of religion in those parts, and preparing the best means of establishing a Gospel ministry among the people." Meanwhile the Reformed Church of America had not been idle. Sporadic missionary work began with it as early as 1786, culminating in 1822 in the organization of the "Missionary Society of the Reformed Dutch Church," differing nothing in spirit from its forerunners, but with a wider scope, as it included home and foreign missions under a single organization. Methodist and Episcopal missions, as well as the Lutheran and those of the Disciples of Christ, belong necessarily to a later period.

It is important, historically, to remember that all these early missionary bodies were called into being by one motive and for one object. Barbarism in the new settlements was the common dread of the East, and to prevent such a disaster by pre-empting those rapidly gathering communities with religious institutions was the

motive of all early home missionary organizations. At the opening of the 19th century, what was known as the new settlements were found mainly in northern New England, eastern and central New York and northern and southern Ohio, and these were the first points of home missionary attack. The opening of the Northwest Territory and the passage of the Ordinance of 1787 attracted a stream of emigration from the East, mingling with which was a considerable element from Great Britain, Holland, Scandinavia, Germany and Moravia, Belgium and Switzerland. The earlier settlers in New York, Ohio, Indiana and Illinois were generally Protestant in their sympathies, but unable at once, with a new country to subdue and new homes to be built, to provide themselves with the institutions of worship. To the help of these hopeful but destitute settlers came the missionary organizations of the East. Their missionaries were hurried forward to every needy point, not only in the wilds of New York and Ohio, but to the remoter settlements of Indiana, Illinois, Kentucky and Tennessee. They even found their way down the Mississippi to New Orleans and crossed the northern borders to Canada. A specially promising field of effort was a section of Ohio, bordering on Lake Erie, settled chiefly by emigrants from Connecticut and for this reason commonly known as "New Connecticut." At the beginning of the century the tract contained about 1,400 inhabitants. In 1804, it had 400 families; one year later the 400 had become 1,100, one-half of them from New England. In less than 30 years from the beginning of organized home missions 90 churches had been planted, all of them by home missionaries sent out and supported by Connecticut and Massachusetts. To sum up in a sentence the work of the Missionary Society of Connecticut at the end of 30 years, 200 missionaries had been employed whose joint labors were equivalent to 500 years of ordinary service by one man, and 400 churches had been established in the new settlements of the land. With what wear and tear of body, with what sacrifice of comforts in the wilderness, with what patience of hope and courage of faith and labors of love, no words can fitly portray. Not a mile of railroad had been built. The river and the canal, the stage coach, the emigrant wagon and the saddle, were the only conveniences of travel, and to these the missionary added footsore and weary tramps from settlement to settlement. During the same period 125 Puritan churches had been gathered in the growing settlements of New York State, supported in whole or in part by home missionary funds.

All these earlier efforts were marked by a commendable absence of the sectarian spirit. A common danger threatened the nation. The problem presented to the churches of the East was how to overtake the new and rapidly multiplying settlements with the means of Christian civilization. No rivalry entered into the struggle, but only a strong sense of the need of prompt, united action. In their love of humanity, and of country every thought of denominational supremacy was buried under the all-absorbing issue whether the New America should be heathen or Christian. This spirit was particularly active between Presbyterians and Congregationalists which were then the strongest church bodies in the land; for 50 years, be-

tween 1801 and 1851, they carried on their missionary work in the new settlements under a "Plan of Union," mutually agreed to, by which the churches of either order, wherever formed, might worship in the same house, listen to the same pastor and profess the same creed, while at the same time they were left free to govern themselves by the polity they loved and preferred.

In 1826 Congregational, Presbyterian, Reformed and Associated Reformed churches united at New York City in organizing a National Society. Such change of policy had become necessary. Hitherto, State societies had been doing national work, each in its own way. But several missionary organizations working independently had resulted in an unequal distribution of men and money. Some sections had been over-supplied and others were left destitute. Moreover, the laborers themselves came into conflict with each other. The time had arrived for federation and co-ordination of effort, and to this end the American Home Missionary Society was organized, as above stated, with headquarters in New York City, the various State societies making themselves auxiliaries to the national organization. Perhaps nothing more potential in the progress of American Home Missions belongs to its history than this act. For years the churches making alliance labored together in fraternal unity, contributing to a common treasury and governed by a single board of direction. Receipts rapidly increased, the missionary force doubled and trebled, and instead of being an itinerant preacher, the home missionary became a settled pastor, dwelling among his people. It was only when these allied church bodies had grown strong that they withdrew one by one to organize separate societies, leaving the Congregationalists to inherit the name and traditions of this honored organization. Indeed, it was not until many years later that "American" was dropped from its charter name and the designation of "Congregational" was substituted. Meanwhile the Methodists had organized their "Missionary Society" (national) in 1819, including home and foreign work; the Episcopal Church, its "Domestic and Foreign Missionary Society,"

1821; the Baptists, their "American Baptist Home Mission Society" in 1832, also national; the Lutherans, their "Home Missionary Society of the General Synod" in 1845, and the Disciples, their "American Christian Missionary Society," in 1849. The Southern Presbyterians, Southern Baptists and Southern Methodists have also their home missionary organizations which are doing a great religious work in the Southern States. Thus, by natural evolution, all the leading Church bodies of America have gradually become organized for home evangelization and a movement, which began in 1798 for the Christian enlightenment of the new settlements, has developed into a system as broad as the national domain, by which the stronger churches of the land are sharing the burdens of their weaker brethren and strengthening those forces of Christian civilization upon which the safety of the nation depends.

The purchase of Louisiana (q.v.) in 1803 imparted a mighty impulse to the missionary movement. That expansion gave us the mouth of the Mississippi and undisturbed possession of its entire course. It carried our western

boundary from Lake Superior to the Rocky Mountains, doubling the national area by a stroke of the pen. Fourteen States and Territories have been carved out of the Louisiana Purchase. They include the great corn and wheat belts of America, and their underground treasures are among the richest of the world. Emigration from the East and Middle West began at once and has reached enormous proportions. It is rivaled in volume only by the millions of foreign birth that have poured and are still pouring into this new and mighty West. By these movements a great missionary problem was presented which the organized home missionary army welcomed with zeal and have never wearied in their efforts to solve. The order of missionary progress through the Louisiana Purchase was strictly along lines of immigration. There is not a State in that vast tract which the home missionary did not enter while it was yet a Territory, and always in the first and feeblest stages of settlement. From Missouri to Iowa, from Iowa to Minnesota, Kansas and Nebraska, thence to the Dakotas, and on from these points to Wyoming, Colorado and Montana, and last of all, when the door was opened to Oklahoma, until every State in this imperial purchase has been leavened with Christian institutions. Something of the volume of this work may be gathered from the fact that in 1916 over 30,000 Protestant churches were enumerated within the Louisiana Purchase, holding property to the value of \$80,000,000 and having 2,700,000 communicants, and, with rare exceptions, this church growth is the fruit of home missionary culture, begun, maintained and supported until the need ceased, by the missionary revenues of these Eastern societies. The same process was repeated when about midway in the century the Oregon Treaty made sure our possession of the Northwest and the discovery of gold opened the Californias to the world. Home missionaries ordained in the East promptly started for the Pacific Coast reaching their fields by the way of Cape Horn and the Sandwich Islands. The strategic position of the far West and Northwest as related to the work of foreign missions in China and Japan was keenly appreciated by the churches and their missionary boards at the East. Money was contributed freely and many of the ablest preachers of the East went forth cheerfully to lay the foundations of Christian society on the sunset shores of the republic. "The Mexican Cession," including Texas, New Mexico, Arizona and Utah, was another belt of peculiar missionary need, which in spite of ancient superstitions and modern delusions has proved a rich field of rewarding home missionary effort.

The close of the Civil War introduced, at the South, a home missionary problem that was absolutely new, and which continues to absorb the interest of Northern churches to an extraordinary degree. Four million slaves were suddenly set free. Government opened its bureaus of relief, and the churches of the North through their missionary boards, hurried forward preachers and teachers. The greatness of the opportunity quickened the home missionary spirit of the whole country. Several of the boards opened freedmen's departments and the churches magnified the privilege of responding to their appeals. To the missionary, himself,

there was in this call an element of peril which, so far from deterring him, only stimulated his zeal. The Yankee preacher and teacher were not well received at first by the white South. Social ostracism was not the only penalty they had to face for their devotion. Violence to their persons and destruction of their property were not infrequent in the early years of this missionary endeavor. An ugly spirit of caste included the negro teacher with the negro and young women delicately reared in the best homes of the North suffered from neglect or open indignity. These conditions have mostly passed away; respect and even gratitude, on the part of the South, have been won, as the fruits of this vast home missionary effort have become more apparent. These fruits appear not only in organized churches for the negro race, but in a long array of universities, colleges, academies, normal, common and industrial schools, planted exclusively for the benefit of the blacks, all of them specifically Christian, and all of them originally supported by the free-will offerings of Northern churches. Howard, Hampton and Fiske, Atlanta and Tugaloo, Talladega and Straight, Shaw and Richmond, Wayland and Leland, Nashville and Bishop, and a host besides, are names as familiar to the educational world as Harvard, Yale or Princeton. They are all the fruit of negro emancipation and all of them are the creation of home missionary interest and enterprise.

It was in 1840 that foreign immigration began to attract the attention of the friends of home missions. Up to that time its entire volume from all sources had not exceeded 500,000. Then began the flood. During the next 30 years the country received about 6,000,000 foreigners. Driven by famines and oppressions at home and drawn by the opportunities of labor in a new country and by our generous homestead laws, they were arriving, for continuous years, at the rate of 500 to 1,000 per day. Between 1865 and 1885 more than 7,000,000 were added to our foreign population, which means that in these 20 years foreign immigration exceeded that of the entire previous record of the country. It is needless to say that, as this vast problem began to be measured and safely comprehended by the churches, the appeal of home missions was almost revolutionized. Hitherto that appeal came from our own people and often from our own kin. To follow close after them on the westward trail and to stand with them in planting the church and the school had been for years the whole of home missions. While this feature has never lost its claim and probably never will, another claim has entered to divide the attention and concern of the churches. To the peril of domestic heathenism has been joined the larger fear of imported barbarism, and thus for many years foreign missions at home has come to be a distinct interest of American home missions. All branches of the church have taken part, through their organized societies, in this effort to Christianize the alien. No nationality has been overlooked; Germans and Scandinavians, Bohemians, Poles and Russians, Hollanders and Hebrews, Spanish, French, Italians, Armenians, Chinese, every sort and condition of foreigners, however forbidding or hopeless, has been made the object of home missionary culture, with results that have astonished the

most sanguine believer and rebuked the most despairing doubter and which have all but silenced the prophets of evil who predicted the direst consequences from the infusion of so much foreign blood into the moral, social and political life of the nation. Many times over it has been demonstrated that every grade of foreign immigrant is susceptible to religious development and is entirely capable of being both civilized and Christianized, and is in fact being rapidly assimilated, through the agencies of education and religion, into the best types of American life. Great migrations are not feared to-day as they were in 1840. Fears have been quieted and the native American stock have come to view with less and less alarm what 50 years ago almost crazed them with apprehension.

To attempt any adequate summary of the results of home missions at the end of 150 years would require a survey of the development of 50 States and Territories so vitally have the home missionary and his work entered into the beginnings and the early history of all our Commonwealths. A few salient facts must suffice. The vitality of the home missionary idea has shown itself, first of all, in the growth of organizations. Beginning in 1798 with the Connecticut Missionary Society it has multiplied itself into more than 30 home missionary bodies, all Protestant, all evangelical and all national. These organizations have collected and disbursed \$150,000,000. Their chief agent has been the Church, with its ordained preacher and its divinely appointed ordinances, and for the Church, these millions have been given. This total, however, takes no account of co-operating agencies, which have been called into being to serve the missionary work of the churches. Add these: Sunday school planting; Bible and tract printing; church building and Christian education; which by careful inquiries are found to have expended \$150,000,000 more, and the grand total for home missions, root and branch, in organized form, is \$320,000,000. Not a dollar of this immense fund has been paid in any commercial sense for value received. All of it has been given, a free-will offering of Christian people to mark their intense conviction of the peril of a nation without the Gospel and their supreme faith in its leavening power. What have these millions accomplished and what of visible fruits remain to justify their cost? It is a fact not generally known, and when known not sufficiently appreciated, that the great evangelical bodies of the United States trace most of their church organizations directly to home missions. Congregationalists admit that four-fifths of their churches are of home missionary origin. The proportion would be larger but for the fact that hundreds of their churches were born before home missions began. Presbyterians confess that nine-tenths of their churches are of home missionary planting. Baptist, Methodist and Episcopal estimates range from five-sixths to nine-tenths. Such ratios can mean but one thing: that these far-spreading ecclesiastical bodies have become strong in church power, not by their own help, but by home missionary aid, the few, strong, bearing the burdens of the many, weak, and they answer the inquiry which suggests itself at once to a thinking mind: where and what would these ecclesi-

astical establishments be to-day but for the helpful agency of organized home missions? To the credit of home missions, therefore, should stand the undoubted truth, that an overwhelming majority of the evangelical churches of America owe their being to its nurture and care. What does such a fact mean in the religious development of the country? In the year 1800 the United States had one evangelical communicant in 14.50 of the population. In 1850 that ratio had grown to one in 6.57; in 1870, to one in 5.78; in 1880, to one in 5; in 1890, to one in 4.53, and in 1900, to one in 4.25. In other words, evangelical church membership increased three and one-half times faster than the population in less than 100 years. Between 1800 and 1890 population increased 11.8 fold; in the same period evangelical church membership increased 38 fold. To these figures Dr. Daniel Dorchester, their compiler, adds the comment: "This exhibit of religious progress cannot be paralleled in the history of God's kingdom in any land or any age." It is only 140 years since Voltaire in Geneva declared: "Before the beginning of the 19th century Christianity will have disappeared from the earth," and it is less than 100 years ago that American infidels were prophesying that the church would not survive two generations in this country. In defiance of these dismal auguries the average yearly increase of evangelical communicants has fulfilled the prophecy of a larger average than ever for the 20th century. It is no vain boast, therefore, but the obvious truth, that by far the larger part of this remarkable growth is due to the direct agency of American home missions, since in its own carefully planted gardens most of this growth has taken place.

Consult Leonard, D. L., *A Hundred Years of Missions*, 3d ed. (New York 1913); Latourette, J. S., *A History of the Expansion of Christianity*, 7 vols. (New York 1937-1945).

MISSIONS, Roman Catholic. Missions and missionaries are words derived from the Latin verb meaning "to send," apostolate and apostle being derivatives of the corresponding Greek verb. In the Catholic Church all works contributing to the external growth of the church are accomplished by a commissioned personnel (that is, by persons sent), and are rightly called missionary. The establishment of the church and the fostering of its growth among non-Christians is the principal work of foreign missions; the promotion of the expansion of the church among non-Catholic Christians, that of home missions. The Code of Canon Law (Canon 1350) places direct responsibility for foreign missions on the pope; for home missions, on the bishops and parish priests in their respective territories.

Foreign Missions.—Jesus Christ, Himself an apostle (Hebrews 3:1) and the divine prototype of all missionaries, established the foreign missions when He laid on the church the task of giving to men, for all of whom He shed His blood, the opportunity to become the sons of God, and He promised His church that He would be with her as she carried out this order (Matthew 28:18-20; Mark, 16:16-20). The church ever makes her own St. Paul's words, "Woe to me if I do not preach the gospel!" (1 Corinthians 9:16).

Mission history began on the first Pentecost. First missions were undertaken by, or un-

der, the apostles, and in these missions Paul, the Apostle of the Gentiles, won undying fame. Even in its earliest years the church did not restrict its mission to the Roman Empire, but the history of the missions outside the empire is obscure and they led to no great and lasting results. The empire was prepared by God to be Christianity's first home, and the Catholic Church was Roman from the outset. Christianity grew as a religion of cities which quickly adapted itself to the imperial framework. The Roman Church derives its primacy from the residence and death of the prince of the apostles in Rome, but it was Rome's position as the imperial capital that, under divine guidance, attracted St. Peter and made the church in the capital the center and headquarters of the new religion.

By the time of the Edict of Milan (313) there were perhaps 4 million Christians in the empire, and Armenia had become the first officially Christian state about 300. By 400, Christians numbered about 10 million in the empire, and there were scattered groups of Christians on its Asiatic and African fringes. Up to 313, Christian missions had had to meet popular and official opposition and often severe and prolonged persecution; after that date they received some aid from the Christian emperors. We have no precise information about the activities of the early Roman bishops in the work of converting pagans, but it is probable that they played a large part in the direction of this work in proconsular Africa and parts of Gaul and the Balkans, as well as in peninsular Italy. There were professional missionaries throughout this era, but most converts were made by the local clergy and Christians, Christian expansion being largely due to personal contact with pagans who were brought to the church by the example of their Christian friends and neighbors. The conversion of Ireland (432-461) by St. Patrick was a mission conquest outside the empire, noteworthy in itself and for the mission history of the future. The Irish mission was neither initiated nor inspired by Rome, but St. Patrick had authority from Rome to organize the church in Ireland. He showed great tolerance for native customs, especially in his adaptation of monasticism to Irish life. Irish monks are found in the following centuries as missionaries in all parts of the West, generally on their own initiative and without a special mission from Rome, which had only to record their victories.

The Roman Empire of the West, long in precarious condition, fell in 476. The church was then ready to play its part as educator and mother in Christ to the barbarian peoples, some of them already Arian Christians. The baptism of Clovis, king of the Franks, in 496, may be said to mark the beginning of the medieval missions. It was also a symbol of new methods for new times in which the baptism of kings and princes would often result in the incorporation of whole nations and tribes in the church. The medieval missions won the young peoples of Europe to the church, the missionaries being usually monks, Celtic or, more often, Anglo-Saxon and Frankish. England was the first nation to be converted by missionaries sent by a pope (Gregory the Great, 590-604), and following a papal plan. Rome also directed the work of later Benedictine missionaries, notably that of the greatest of them, St. Boniface. They often owed their missionary opportunities to the

military conquests of Frankish monarchs, a means of enlarging her borders which the church merely tolerated, knowing that, if baptism could be imposed by force, no compulsion could produce faith. Thus, even after mass baptisms, the mission work of instruction had to go on. The medieval European missions, completed in the 13th century, were characterized by great organizing genius and wise consideration of national customs.

The West had been cut off from the Far East by the rise of Islam in the 7th century and by the later schism of the Oriental churches. And Islam, not content to bar the way to the East, to destroy Christianity or gradually to reduce Christians to impotent minorities in Asia Minor, North Africa, and Syria, had threatened the European church itself with extinction. The counterattack of Christian Europe, the Crusades, did much to rouse the missionary spirit in Europe by making the Middle Ages aware of vast and populous regions untouched by the gospel. The great new orders, the Franciscans and Dominicans, proved most sensitive to the new opportunities. The medieval popes zealously fostered mission work in Asia. Intrepid missionaries like the great Franciscans, John of Montecorvino (1246-1328) and Odoric of Pordenone (1286-1331) reached China by the land route, and the archbishopric of Peking, erected in 1307, at one time counted about 100,000 Christians. These heroic missionaries penetrated to hitherto inaccessible regions such as Ethiopia, Persia, Tartary, and China; and though they failed, through no fault of their own, to establish the church permanently in these regions, in them we can detect the beginnings of modern Catholic missions, in their awareness of the need of study and preparation and of discovering points of contact with the peoples to be evangelized. Unfortunately, Christian Europe in the 14th and 15th centuries was torn by schism, heresy, and war, and the foreign missions suffered, as they always suffer, from the decadence and low spiritual vitality of the home church. The missions of China were ruined by the triumph of the Ming dynasty over the Mongols in 1368, and those of Persia by the Mongol invasion under Tamerlane (Timur) whose conquests closed the land route to the East.

Events soon made this unimportant. In 1415, the Portuguese capture of Ceuta bottled up the Barbary corsairs in the Mediterranean and made the Atlantic a Christian ocean. Christian naval exploration, partly of mission inspiration, culminated in the Spanish discovery of America in 1492 and the Portuguese discovery of the sea route to India in 1498. Vast new fields were thereby opened to Catholic missions over which, by papal concession, Spain and Portugal exercised a kind of monopoly in their respective domains. In America the missionaries, at first mainly Franciscans and Dominicans, received great assistance from Spanish authorities and colonists, although the ruthless cruelty of the latter in their dealings with natives often brought them into conflict with the missionaries, especially the great Dominican Bartolomé de las Casas (q.v.). The work of evangelization, often quite superficial in the early period, was achieved in an astonishingly brief period. The Holy See took an active interest in these missions and repeatedly, though without great success, intervened to protect the rights of the

natives and to insist on the formation of a native clergy and the thorough instruction of the new Christians.

In the Far East, Christianity met almost everywhere with opposition from pagan rulers, and the church was founded and maintained only at the cost of much blood. Here a the earliest missionaries were Franciscans and Dominicans. But the Jesuits, who were also engaged in heroic mission enterprises in North and South America and in Africa, especially distinguished themselves for far-flung and carefully planned missions. St. Francis Xavier (q.v.), whose brief decade (1542-1552) as a missionary in the East immortalized him, became to Catholic missionaries a model and a patron. Jesuit missionaries of all nations succeeded, by their scientific preparation and prudent zeal, in opening up China, Japan, Annam, and the lands of the Great Mogul to the gospel. The Philippines were almost completely evangelized during this period. The missions in Japan made wonderful progress until they were checked by the fierce persecutions which almost put an end to Japanese Christianity. The missionaries of this period, Jesuits and others, in the Far East, Africa, and the Americas, were ambitious and bold planners who showed incredible courage in trying to realize their plans.

By 1750 it was obvious that the missions were in a decline. This began much earlier with conflicts among the missionaries themselves, caused partly by the rivalries of European nations and partly by disagreement regarding certain methods of evangelization and of adaptation to native customs. Many other causes contributed to this decline: the lowered prestige of the Catholic nations, the loss of their sea power, the anti-religious spirit which then pervaded Europe and made deep inroads in the church, affecting the missionary societies, and leading to the suppression of the Society of Jesus in 1773, to the French Revolution, and to the long European turmoil that followed it. By 1800 about 1,000 aging missionaries were desperately trying to keep a little life in their dying works.

Twenty years later, although the number of missionaries was possibly less, the tide had turned. A new missionary era had begun, an era of ever-improving communications, of the revival and foundation of missionary orders and societies, of the re-establishment of the Society of Jesus. France took over the first place in Catholic missions from Spain and Portugal. Italy, Germany, Belgium, Holland, Ireland, and other countries supplied increasing numbers of missionaries, although in 1940 one fourth of the total personnel of Catholic missions was still furnished by France. In the 20th century, the church in the United States began to play a part in the missions of the Catholic Church. Many American religious communities undertook foreign missionary work. European missionary societies started American branches, and the Catholic Foreign Mission Society of America was founded at Maryknoll, N. Y. American Catholic missionaries, a mere handful before 1918, were about 3,000 in 1943, three times the total number of Catholic missionaries in 1800. To realize what was accomplished in this era, it is enough to contrast the 80,000 missionaries (priests, brothers, and sisters) of 1940 with the 1,000 of 1800, or to realize that the growth of the church in China alone between

00 and 1940 was greater than its growth in the Roman Empire in the first 300 years of its story. And in 1940, despite the temporarily crippling effects of World War II, there was good reason to be optimistic about the future of the missions.

The territories of Catholic missions are under the supreme authority of the pope who, since 1922, administers them through the Congregation of Propaganda, a department or ministry of the missions headed by a cardinal prefect who is assisted by other cardinals and by numerous officials. This congregation determines territorial divisions (about 650 in 1940), appoints their personnel, supervises the activities of the missionaries, advises them on missionary problems, and acts as a clearing house for all problems from the mission world which it has not the authority to settle. But Propaganda territory is not exactly coterminous with mission lands. Some countries under Propaganda are not really missionary, and some regions, ecclesiastically under the Consistorial or Oriental Congregations or that of Extraordinary Ecclesiastical Affairs, are in reality missionary. Mission territories are usually ruled by vicars or prefects apostolic, the former being almost always bishops. In most larger territories the pope is represented by an apostolic delegate. Most missionaries belong to religious orders or societies. In 1940 there were engaged in the foreign missions about 70 such communities of men, 30 of brothers, and over 450 of sisters, as well as an army of catechists and other native assistants.

The great progress of Catholic missions since 1900 owes much to the personal interest of the popes. Gregory XVI (1831-1846), a former cardinal prefect of Propaganda, began a tradition of papal attachment to the cause of the missions which did not decline under his successors, Pius IX, Leo XIII, and Pius X. It was more intense, or at least more manifest, during the reigns of Benedict XV (1914-1922) and Pius XI (1922-1939). Both of them wrote important missionary encyclicals, to rouse Catholic interest and support in the missions, to revise certain aspects of mission work, to recall the great missionary traditions and principles of the church concerning solid instruction of converts and the importance of early and vigorous efforts to form a native priesthood and episcopate, to commend sympathetic appreciation of national conditions and customs, and accommodation to them in all lawful ways. Pius XI, in the secret encyclical of May 23, 1923, declared the work of the missions the greatest and holiest of all Catholic works, and sponsored a great Mission Congress at Rome. In 1923 he nominated two natives of India as bishops; in 1928 he personally consecrated six Chinese bishops in St. Peter's; in 1929 he consecrated a Japanese; in 1931, three more Chinese, one Annamite, and one Indian. Pius XII continued this policy: in 1939 he consecrated native bishops for China, India, Uganda, and Madagascar and in 1946, his first consistory he elevated a Chinese, Bishop Thomas Tien of Tsingtao, to the cardinalate.

A notable feature of Catholic missions in the modern period is the scientific study of the missions. The first scientific Catholic mission periodical, the *Zeitschrift für Missionswissenschaft* (1911-1937), was edited by Dr. Joseph Schmidlin

(1876-1943), professor of church history and missiology at the University of Münster. As director of the International Institute for Scientific Mission Research in the same university, he aided the publication of the monumental bibliographical work, the *Bibliotheca Missionum* (13 volumes in 1945), by the Oblate Fathers, Robert Streit and Dindinger, as well as the two collections, the *Missionswissenschaftliche Abhandlungen und Texte* (14 volumes) and the *Missionswissenschaftlichen Studien* (7 volumes). The review was carried on under another title and with a somewhat different purpose from 1938 to 1941. Dr. Schmidlin died under Nazi torture in the concentration camp at Schirmeck. In France, Georges Goyau (1869-1939), perpetual secretary of the French Academy, was a pioneer and moving spirit in this field. From 1924 to his death he was one of the editors and principal contributors of the *Revue d'Histoire des Missions*, and from 1926 he held the chair of mission history in the Catholic Institute of Paris. In 1933 two Roman universities, the Gregorian and the Propaganda, opened missiology faculties. In 1944 the University of Fribourg, Switzerland, opened an Institute of Mission Studies, and in 1945, in close connection with this institute, a new review, the *Neue Zeitschrift für Missionswissenschaft*, was started. Other Catholic universities have chairs of missiology, the most important of these being perhaps that of Louvain, Belgium, held by the Jesuit, Father Pierre Charles. Under his direction also are held the annual Louvain Missiology Weeks which have deservedly won fame for their scientific and fearless discussion of mission methods.

All Catholic missions under Propaganda receive some support from the Society for the Propagation of the Faith, founded in 1822 at Lyon, France, as an international association to assist Catholic missionaries by prayers and alms, and since organized in most Catholic dioceses. Since 1922 the general headquarters of the society is in Rome, the secretary of the Congregation of Propaganda being president of the superior council. Other international organizations which seek to arouse Catholic interest in missions, or in some special aspect of them, are the Missionary Union of the Clergy, the Society of the Holy Childhood, and the Society of St. Peter. The proportion of Catholics actively interested in mission work cannot be accurately estimated, but it increased sufficiently in the 20th century to bode well for the spiritual life of the church at home. For the missions not only reflect the vitality of Catholicism in the lands that send missionaries, but the sending church is always enriched and uplifted by its own interest in the foreign missions. Any association with mission work is an incentive to zeal and the spirit of sacrifice, and a healthy reminder of the true nature of the church and of the duty of her children to assist the non-Christian three fifths of mankind to know Christ and His salvation. Catholics cannot but benefit by coming to know the story of Catholic missionaries who have written some of the most glorious chapters in the annals of the church and of humanity.

Home Missions.—Responsibility for the expansion of the church in non-missionary regions lies, as noted above, with the bishops and parish priests. Here it must suffice to describe the

missionary work within the United States. The need of an organized effort to present Catholicism to American non-Catholics in its true light led to the foundation of the society known as the Paulist Fathers (q.v.) in New York in 1858. The Paulist method of apostolate was given its definitive form by the Reverend Walter Elliott in 1893 when he began in public halls and churches in Michigan a series of missions to explain the doctrines of the Catholic Church. These missions, while they made a point of eschewing controversy, invited inquiry by providing at the door a Question Box for the questions of those whose interest was aroused. This mission technique, later used by many others besides the Paulists, achieved great success, not so much in winning converts to the church, as in creating in non-Catholic America a more sympathetic, because more enlightened, attitude toward the Catholic Church, in eliminating absurd but sincerely held misconceptions about its nature and aims, and in lessening friction between the church and other Christian groups. In 1917, David Goldstein, a layman who was a convert from Judaism, began on his own initiative to travel from coast to coast by automobile giving street-corner talks on the Catholic Church. The Catholic Evidence Guild, originally founded in England, and later organized in many American cities, provides trained speakers, mostly laymen, to present Catholic doctrine to outdoor audiences on street corners and in public parks. Outstanding American Catholic orators such as Msgr. Fulton J. Sheen and Father James M. Gillis, have regularly presented Catholic teaching to large radio audiences. These sermons, though they are entirely unpolemical, have brought many to a better understanding of the church and led some to join it.

These forms of home missionary effort are especially, though by no means exclusively, concerned with reaching the non-Catholic populations of cities and towns. But it is in rural America, especially in the South and West, that the Catholic Church is least known and least understood, as may be judged from the fact that in 1938 out of 3,070 counties in the United States 1,000 had no resident priest. A pioneer in the rural apostolate was Father Frederick Price of North Carolina, later co-founder of Maryknoll, who labored from 1886 to 1911 among the rural non-Catholic population of his native state with a zealous enthusiasm which inspired many later missionaries in the same field. In 1905, Father (later Bishop) Francis C. Kelley founded the Catholic Church Extension Society to aid in building churches and chapels in poor missionary parishes. This society built and operated a railroad chapel car from which missions were given to non-Catholic audiences in many small towns and villages. It was the model of the later motor "church on wheels," equipped with an altar, public address system, moving picture projector, and accommodations for missionaries. This motor chapel has been widely used, especially for summer campaigns conducted by various groups of priests and seminarians in many sections of rural America, further instruction of interested non-Catholics often being carried on by correspondence.

Through these seasonal campaigns a number of converts have found their way into the Catho-

lic Church, but their success consists mainly in dispelling ingrained prejudices and thereby creating an atmosphere in which Catholic claims may hope to receive impartial, if not sympathetic, consideration. For more lasting and greater results, the actual establishment of the church with resident priests in the rural districts seems indispensable. This conviction led the Reverend Howard Bishop, a priest of the archdiocese of Baltimore, to found in 1939, under the patronage of the archbishop of Cincinnati, the Home Missioners of America. By 1944 this numbered 10 priests, 14 students, and 3 brothers, and with it was associated the Women's Missionary Society, a group of 6 young women. As the first field of their apostolate, the Home Missioners took rural areas in southern Kentucky and southern Ohio, and in these they began to apply, with adaptations called for by the conditions, the methods commonly used in Catholic foreign mission work. Besides this new society, exclusively devoted to the home missions, there are many other missionaries, members of religious communities of men and women and diocesan priests, permanently engaged in the work of the apostolate in rural America.

NEGRO MISSIONS

A special field of great importance for the home missions is represented by the Negro inhabitants of the United States. Negro Catholics in 1944 numbered 313,000 (103,000 in the North) out of a total of 13,000,000, of whom 7,000,000 were without church affiliation. In the same year there were engaged in Catholic activities for the Negroes 558 priests (18 Negro), 3,000 sisters (471 Negro), and 24 brothers (8 Negro). One community of priests, the Josephites (Society of St. Joseph of the Sacred Heart) is exclusively devoted to the apostolate for the Negro; there are four communities of Negro sisters, and one seminary for Negro students for the priesthood, the latter conducted by the Society of the Divine Word.

The American Board of Catholic Missions, the president of which is the archbishop of Chicago, distributes financial assistance to all forms of home missions. The Indian and Negro missions have received valuable financial aid from Mother Katharine Drexel, foundress of the Sisters of the Blessed Sacrament for Indians and colored people, who has devoted her life and her fortune to missions to these two races.

The phenomenal growth of American Catholicism, due, of course, in great part to immigration and the natural increase of the Catholic population, nevertheless owes much to the various forms of home missionary work. The *Official Catholic Directory* for 1945 gave the number of converts to the Church in the previous year as 84,908. There are no statistics to show how many conversions can be traced to the various missionary works of the church, and the things that awaken the first interest of future converts are manifold and often quite unrelated to any organized attempt to arouse it. But the results of home missionary work are gratifying, especially in view of the difficulties of the work and the relatively small number of workers.

REV. J. F. McCONNELL,
Professor of Sacred Scripture in Maryknoll Seminary.

CATHOLIC INDIAN MISSIONS OF THE UNITED STATES

Colonial Period.—Catholic priests accompanied the Spanish and French explorers of what is now the United States and set up missions in connection with the earliest military and commercial posts. Mission foundations which were to have a certain permanency were organized in Spanish Florida in 1549; in New Mexico in 1598; in Texas in 1659; in southern Arizona in 1700; and in California in 1769. Numerous missionary establishments grew up from these beginnings and extended from Georgia and Florida to the West Coast. At its highest estate, Spanish Florida had 20 missions to which 40 missionaries and 26,000 Christian Indians were attached; Texas had at one time 14 mission centers and 15,000 Indian converts; New Mexico had 25 churches in 1630 among the Pueblos and Hopis, and 25,000 of these Indians were under the influence of the missionaries; the 21 California missions were homes and centers of adult education for 30,000 Indian converts by the year 1828; the early Pima missions in Arizona consisted of only four resident missions but exercised a large and lasting influence. The Florida missions came to an end with the British conquest of this area, and the Christian Indians were either exterminated or dispersed. The Texas and California missions were secularized by the Spanish and Mexican governments in the early 19th century and almost all of their civilized converts rapidly disappeared before the advance of American settlement in these states. The mission work has uninterrupted in only New Mexico and Arizona. The Spanish missionaries, represented chiefly by Franciscan friars, diligently instructed the savage in the rudiments of civilized life; they induced the nomadic Indians to settle in villages, introduced livestock and European cultivated plants, taught the natives to develop gardens, farms and ranches, and set up workshops in which the handicrafts were taught.

The earliest French mission among the Abnakis of Maine was established in 1604; this group of small migratory tribes became and remained staunch Christians. The Iroquois missions in New York were begun by St. Isaac Jogues in 1642 and continued intermittently among these tribes until 1687; a later mission among the Mohawks, established in 1756, still exists. Successful missionary work among the Indians of the Great Lakes area was initiated in 1660; among the Illinois tribes in 1674, and among the Indians in Indiana in 1711. Several missions were established along the lower Mississippi River during the 18th century but never flourished. Missions which proved to be short-lived were attempted in Virginia (1570), in Maryland (1633), in Vermont (1743), and in Minnesota (1743). The areas under French control or influence were occupied by small seminomadic

tribes with whom it was generally difficult to maintain prolonged and fruitful contacts. Moreover, the number of missionaries, chiefly members of the Society of Jesus, was too small and their resources too meager to achieve large results. While their careers were heroic, they succeeded in building up few permanent Christian communities.

National Period.—The heritage of the church of the new United States consisted of a few small missions in Maine, Michigan, Illinois and Indiana. Scarcity of clergy rendered impossible, at first, the extension of missionary work. The first Catholic Indian school was established in the second decade of the 19th century near Detroit by Reverend Gabriel Richard, S.S. From 1830 to 1868, Father (later Bishop) Frederic Baraga (q.v.) and his co-workers developed successful missions and schools among the Ottawas, Chippewas, Menominees, and Potawatomes of Michigan, Wisconsin, Indiana, and Minnesota. The Jesuits undertook work among the Kickapoos (1836), Potawatomes (1836), and Osages (1846) in the present State of Kansas. Fathers François Blanchet and Modeste Demers, later bishops, inaugurated missions in the Columbia River valley in 1837, and were soon followed by Father Pierre Jean De Smet and his Jesuit collaborators, who evangelized the Indians of Montana, northern Idaho, and western Washington. The remnants of the Spanish missions in California, New Mexico, and Arizona were adopted by American bishops and priests after the acquisition of the Southwest at the termination of the Mexican War.

A sequel of President Grant's peace policy was the establishment in 1874 of the Bureau of Catholic Indian Missions at Washington, D.C., to represent Catholic Indian interests at the seat of government, and to speed the development of religious and educational work among the Indians. Under this impulse, missions and schools were successfully undertaken among the Papagos, Sioux, Arapahoes, Crows, Gros Ventres, and smaller neighboring tribes. Later the work was extended among new tribes in Oklahoma, Arizona, New Mexico, California, and in the Territory of Alaska.

Present Status.—Indian tribes under 53 agencies, out of a total of 64, were provided with Catholic missions (1947). Religious and educational activities are carried on in Arizona, California, Colorado, Idaho, Kansas, Louisiana, Maine, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, New York, North Dakota, Oklahoma, Oregon, South Dakota, Washington, Wisconsin, Wyoming, and the Territory of Alaska. Out of a total Indian population of 273,650 resident on reservations, 94,085 are reported to be Catholics. More than 200 priests, both diocesan and religious, aided by catechists (Indian and white), are engaged in religious and missionary work. Churches and chapels for Indians number 402. Sixty-five mission schools, of which 39 are day schools and 26 boarding schools, have an attendance of more than 7,000 Indian pupils. The personnel of these schools comprises 625 teaching sisters, lay brothers, scholastics, and lay teachers. Two hospitals for Indians and several medical dispensaries are maintained.

Director, Bureau of Catholic Indian Missions.

MISSISSAUGA or **MISSISSAGA INDIANS**, mis-i-sô'ga, an American tribe of the Algonquian family and a subtribe of the Chipewewa, were first encountered by the French in 1634. They were living at the mouth of the Mississagi River in Ontario, Canada, and on the adjoining Manitoulin Island in Lake Huron. In the early part of the 18th century they began to drift southward for trading purposes, settling around Lake St. Clair and Lake Ontario. They were living in five villages near Detroit when they were admitted as the seventh tribe of the Iroquois league in 1746. This alliance lasted only until the outbreak of the French and Indian Wars (1755-1763). In 1778 their number was estimated at 1,250. There are about 600 of the Missisaukas remaining. They inhabit small reservations in Ontario and are progressive, industrious, self-supporting citizens.

MISSISSINEWA, Battle of, occurred on Dec. 18, 1812, at a site on the Mississinewa River near Jalapa, in Grant County, Indiana. It became evident to Gen. William Henry Harrison (Tippecanoe) that the Miami Indians, a tribe of the Algonquian family, were being incited to hostilities against the white settlers by the British. He sent Col. John B. Campbell to attack and destroy their villages. After destroying several villages, the army moved up the Mississinewa to Jalapa, planning to continue their destruction until they reached its junction with the Wabash. However, before daylight their camp was surrounded and attacked by 300 Miami braves. About 30 Indians were killed and Col. Campbell lost 8 of his force, with 48 wounded. As a result, he decided it best to return to Ohio. His campaign, however, had accomplished its purpose. He had struck terror in the hearts of the Indians, and they took no further active part in the War of 1812.

MISSISSIPPI, mis-i-sip'p'i, the seventh state admitted to the original Union, is bounded on the north by Tennessee, on the east by Alabama, on the south by Louisiana and the Gulf of Mexico, and on the west by the Mississippi River, dividing it from Louisiana and Arkansas.

State flag.

Along the Gulf coast the state claims all islands "within six leagues of the shore." The greatest length north and south is 330 miles; the greatest

breadth east and west, 180 miles. The name, taken from the river which forms its western boundary, has been interpreted as Choctaw, meaning "beyond age," or Illinoian, meaning "great water" or "father of waters."

Land area	47,248 square miles
Water area	468 square miles
Total area	47,716 square miles
Latitude	30° 13'—35° N.
Longitude	88° 7'—91° 41' W.
Altitude	sea level to 780 feet
Population (1950)	2,178,914
Capital city—Jackson; Pop. (1950)	98,271
Admitted as a state	Dec. 10, 1817
Bird (unofficial)	Mockingbird
Flower	Magnolia
Motto	<i>Virtute et Armis</i> (By valor and arms)
Nicknames	Magnolia State; Bayou State
Song (unofficial)	Mississippi
Tree	<i>Magnolia grandiflora</i>

State seal.

Physical Characteristics.—Topography.—

There are 10 physiographic areas which conform generally to the geological structure. (1) The low, fertile, productive delta lies between the Yazoo and Mississippi rivers. (2) The loess bluffs, beginning at Memphis, stretch around the eastern border of the delta to Natchez. These rugged hills quickly erode and become impossible of cultivation. (3) Along the Gulf of Mexico lie the coastal terraces, a narrow strip of low, level, sandy soil unsuited for agriculture. (4) Immediately above these plains and reaching northward almost to Jackson and Meridian lie the Piney Woods. This portion was of slow development until the commercial value of the longleaf pine forests was realized. (5) A narrow prairie belt stretches from Vicksburg to the Alabama line. This gently rolling area yields some of the great agricultural profits of the state. (6) The most rugged and higher section is the fall line hills near the Tennessee River in the extreme northeastern part of the state. The red, sandy hills are exceedingly unsuitable for cultivation. (7) Around the western border of these hills lies the Black Prairie belt. Its rolling surface is a fertile farming area which has become a center for livestock. (8) The long narrow, wedge-shaped district known as the Pontotoc Ridge of hills enters the state from the northeast and moves south along the western rim of the Black Prairie. The soil erodes easily, but originally grew a diversity of crops. (9) There comes a strip of low-lying land, the flatwoods which skirts the western and southern edge of the Pontotoc Ridge and Black Prairie belt. This area is important only as a source of forest products. (10) The remaining section, lying between the flatwoods and the loess bluffs, is called the North Central Highlands. The soil is a yellowish-brown loam adaptable to raising a number of crops.

Climate.—The climate is semitropical, the average annual mean temperature over a period of years being 65.5°F.; for winter 48° and for summer 81°. The extended period of warm weather allows for long growing seasons and moisture. The average rainfall is 54 inches, more occurring along the coast than in the northern section.

Rivers.—A number of rivers drain the state. In the southwest the Big Black and Homochitto flow into the Mississippi. The west and northwest are drained by the Yazoo and its tributaries which flow into the Mississippi near Vicksburg. In the northeast are the Tombigbee, flowing through Alabama into Mobile Bay, and the Tennessee, which turns northward and empties into the Ohio. In the southeast the Leaf and Chickasaw come together to form the Pascagoula, which ultimately passes into the Gulf of Mexico. The longest river of Mississippi is the Pearl, which drains the central portion of the state and flows into the gulf.

The only area where drainage is a serious problem is the delta. There a system of canals and levees has been constructed to protect the land against inundation. There is also a large retention dam across the Tallahatchie near Sardis to help control flood waters.

Political Divisions.—**Cities.**—A complete list of the cities and towns of the state, with their 1950 populations, is on the back of the state map which is part of this article. The following cities, with 1950 populations, are of special importance.

In the central section: Jackson, population 271, altitude 294 feet; Meridian (pop. 41,893, alt. 341); Hattiesburg (pop. 29,474, alt. 143); and Laurel (pop. 25,038, alt. 243). The first is the state capital, the second a leading industrial town, the third the place near which the famous camp Shelby of World Wars I and II was located, and the fourth, one of the earliest and most important locations of the lumber industry and its allied manufactures.

The outstanding delta communities are: Greenville (pop. 29,936, alt. 125); Greenwood (pop. 18,061, alt. 143); and Clarksdale (pop. 15,539, alt. 173). All are centers of the cotton growing and trading region.

The Gulf coast is represented by Biloxi (pop. 14,425, alt. 22), and Gulfport (pop. 22,659, alt. 11). The former is near the site of the oldest white settlement in Mississippi, Fort Maurepas. The latter is a major recreational center with an artificial harbor for shipping.

The Old South still lives at Vicksburg (pop. 19,948, alt. 206), and Natchez (pop. 22,740, alt. 12), on the Mississippi, and at Columbus (pop. 17,172, alt. 250), on the Tombigbee. A beautifully kept military park commemorates the campaign and siege of Vicksburg. The historic farm and culture of Natchez defy description. In the rich prairie section, Columbus is the site of Mississippi State College for Women, the first state supported college for women in the United States.

The New South is the spirit of Tupelo (pop. 15,527, alt. 289). Tupelo entered the first contact for the purchase of electric power from the Tennessee Valley Authority. A few towns such as Canton, Columbia, Yazoo City), near the new oilfields are so-called "boom towns."

Counties.—Mississippi has 82 counties, which, with their county seats, are as follows:

County	County Seat	County	County Seat
Adams	Natchez	Lee	Tupelo
Alcorn	Corinth	Lefflore	Greenwood
Amite	Liberty	Lincoln	Brookhaven
Attala	Kosciusko	Lowndes	Columbus
Benton	Ashland	Madison	Canton
Bolivar	Cleveland	Marion	Columbia
Calhoun	Rosedale	Marshall	Holly Springs
Carroll	Pittsboro	Monroe	Aberdeen
	Carrollton	Montgomery	Winona
Chickasaw	Vaiden	Neshoba	Philadelphia
Choctaw	Houston	Newton	Decatur
Claiborne	Okolona	Noxubee	Macon
Clarke	Ackerman	Oktibbeha	Starkville
Clay	Port Gibson	Panola	Batesville
Coahoma	Quitman	Pearl River	Sardis
Copiah	West Point	Perry	Poplarville
Covington	Clarksdale	Pike	New Augusta
De Soto	Hazlehurst	Pontotoc	Magnolia
Forrest	Collins	Prentiss	Pontotoc
Franklin	Hernando	Quitman	Booneville
George	Hattiesburg	Rankin	Marks
Greene	Meadville	Scott	Brandon
Grenada	Lucedale	Sharkey	Forest
Hancock	Leakesville	Simpson	Rolling Fork
Harrison	Grenada	Smith	Mendenhall
	Bay St. Louis	Stone	Raleigh
	Gulfport	Sunflower	Wiggins

	Carthage		

The People.—**Origins.**—The population of Mississippi is overwhelmingly native-born. According to the census of 1940, only 6,472 are foreign-born, being .03 per cent of the total population. The greatest number of original settlers were Scotch-Irish from the Atlantic seaboard states, although the leaders generally came from New England and New York and were of English origin. In the late 19th century there was an infiltration of Germanic, Slavic, and Latin peoples from New Orleans following the Illinois Central Railroad, but they were quickly absorbed. In the Delta there are small settlements of Chinese. The law forbidding miscegenation discriminates against these Orientals as well as against the Negroes. Indians to the number of 2,134 (1940) still live in Mississippi.

Until 1940, Mississippi showed a numerical preponderance of Negroes. For the first time since 1840 the census showed a slight majority of whites. The count has been questioned, since Selective Service indicated a number of Negro men who did not appear in the census. In any case the latest estimates show that now (1947) the Negroes are in a slight minority. They are largely concentrated in the Delta counties, in many of which they constitute two thirds to three fourths of the population.

The state's population declined 0.2 per cent between 1940 and 1950 to a total of 2,178,914. This reduction was partially accounted for by the movement into the armed forces and war industries, particularly during World War II, and also by the continued northward migration of Negroes after the war, seeking better economic opportunities in such large cities as St. Louis, Chicago, and Detroit.

Mississippi is predominantly rural. The 1950 census showed the rural population as 1,571,752 (72.1 per cent) as against an urban population of 607,162 (27.9 per cent). According to the 1945 Census of Agriculture, the farm population was 1,050,444. Generally, the income level of the people of Mississippi is low, their average per capita income being about \$698 in 1950, although in the towns and cities, income was higher.

Famous Mississippians.—Nationally recognized work in painting has been done by John McCrady who found in the Negro his best material. One of his greatest pieces of work, *Swing Low, Sweet Chariot*, depicts the Negro's idea of death and the ascent to Heaven. Another artist of note is Karl Wolfe, portrait painter and art teacher. In literature, such writers as Irwin Russell, Stark Young, William Faulkner and William A. Percy have done work of high quality both in prose and poetry. Another group of writers who have depicted Mississippi life include David Cohn, James Street, and Eudora Welty.

Natural Resources.—Fauna.—Few of the larger wild animals formerly abundant now remain. The chief game are cottontail, squirrel, raccoon, and opossum, although occasionally one may find a deer or fox. In the Bayou Pierre swamp and elsewhere there are still some alligators. One can catch almost any kind of freshwater fish, bass, cat, bream, or perch. The greatest number of birds is found on the coast where many kinds are plentiful. The mockingbird is common to all sections.

Flora.—Deserving special mention among the flowers are the azalea, camellia japonica, and poinsettia, all growing without protection in the south. More than a 100 species of trees are found, including numerous varieties of oak. One section, called the Piney Woods, is noted for its longleaf pines. Particularly colorful are the live oaks laden with Spanish moss in the south, the "heaven tree" in the north, and the holly and yaupon which are distributed fairly evenly but occur more frequently in the central portion.

Minerals.—Except for oil the mineral resources are not spectacular in nature. Common brick clay and crude sandstone, suitable for brick, tiles, crucibles, and spark plugs, overlay nearly all the geologic structures of the state. A small quantity of iron ore adaptable for paint pigments has been located. There is a largely untapped supply of high grade bauxite and low grade ore. Such rare clays as bentonite and fuller's earth are found and lignite exists in some abundance. Oil, however, is the most profitable mineral. From 1939 to 1945 fourteen fields located in 11 counties produced 90,050,795 barrels, making Mississippi the eleventh ranking oil producing state in the United States. In 1945 the oil severance tax brought \$1,956,953 into the state treasury. Natural gas was discovered in 1926 at Amory and in 1930 at Jackson. The supply at Amory was limited, but the Jackson field has produced 114,985,557 cubic feet since discovery. By 1945, however, gas reserves were nearing exhaustion.

Forests.—Some type of forests comprise 54 per cent of the total land area, approximately 1,700,000 acres being publicly owned and 14,800,000 privately owned. These acres are almost evenly divided between pines and hardwoods. These resources were seriously depleted before they were placed under the state forestry com-

mission and the United States Department of Agriculture. Of particular interest is the successful culture of turpentine. Approximately three fourths of the United States total growth of Mississippi, the most extensive orchards being in Pearl River County.

Soil.—The importance of the soil and its sources is indicated by the fact that for every person employed in industry there are 17 engaged in agriculture and related occupations. The soil, however, was never unusually rich and is poor in organic material. The top soil is thin, in places only a foot deep, and erosion works constantly against this layer. A large share of the public administration of natural resources is therefore concerned with conservation and utilization of the land. In 1934 only 10 per cent of the total land area showed negligible erosion, but impressive accomplishments have been achieved. By 1945, the United States Soil Conservation Service estimated that 80 per cent of the land area was slightly or moderately eroded, while only 20 per cent was severely eroded. Despite difficulties, more than 85 per cent of the total land area is organized for conservation purposes.

Water and Flood Control.—There is a supply of ground water pure enough and available in sufficient quantity for domestic uses, although no statutes are in force to prevent needless waste. Water pollution has taken on new importance with the increase of industries, but thus far flood control is mainly negative in character. Water problems are primarily concerned with the control and disposition of rivers and streams. The efforts of federal and local agencies are sometimes taxed in meeting the problems of flood control, reclamation of land, and stream alignment. This has been largely accomplished by the construction of levees, reservoirs controlling the headwaters of tributaries of the Mississippi and the maintenance of the present channels.

Parks, Reservations, Sanctuaries, and National Forests.—The program of the National Park Service has been confined to the administration of the Vicksburg National Military Park and Cemetery, the Brice's Crossroads and Tupelo battlefields of the War Between the States, and the Ackia battlefield where the Chickasaws defeated the French in 1736. It also participates with the states of Mississippi, Alabama, and Tennessee in the restoration of the Natchez Trace. On the military sites the work has been marking battle lines, constructing museums, erosion control, and measures emphasizing the historic values. The Vicksburg park receives the major attention. The work on the Natchez Trace was interrupted by World War II. The objective of this program is to preserve the scenic beauty and historic buildings and sit along the parkway.

In 1934, Mississippi had no state parks. From 1935 to 1941 ten were opened, three each in the northeastern, southern, and central sections, and one on the coast, representing a capital investment of \$2,000,000. Amounting to 10,200 acres, they are administered by the Mississippi State Board of Park Supervisors. Although easily accessible, these parks have never served more than 39 per cent of the white people.

Reservations.—The Indian Agency, Philadelphia, was established in 1918. The Indians and the descendants of those Choctaws who chose to remain after the Treaty of Dancing Rabbit

reek (1830). A small plant paper mill and cement and aids in the planning, raising, and marketing of products. A hospital and seven elementary schools are operated in the area. The work costs the federal government approximately \$100,000 per year.

Sanctuaries.—There are two small bird sanctuaries, one in Livingston Park, Jackson, where and the zoo are the outgrowth of a collection begun by the municipal fire department; the other, on the grounds of Mississippi Southern college, Hattiesburg.

National Forests.—Mississippi has set aside 785,010 acres for national forests. The first to be established, the Homochitto National Forest, lies in the southwestern corner of the state. The De Soto National Forest, a dense growth of pine, is located in the southeastern part, just north of the Gulf of Mexico. There are also the Chickasawhay National Forest, Bienville National Forest, Delta National Forest, and, in the extreme north, the Holly Springs National Forest.

Production and Manufactures.—The leading crop is cotton, in the production of which Mississippi is outranked only by Texas. It holds first rank in the yield per acre of lint cotton. The Delta, with its fertile soil and long summers, is particularly suited for the growth of cotton. Other crops in the order of their importance are corn, sweet potatoes, Irish potatoes, beans, peanuts, soybeans, strawberries, peaches, apples, and grapes. Crystal Springs has established a national reputation in the production of tomatoes and cabbage, and Water Valley as a shipping center for watermelons.

The livestock business has developed greatly with as to beef types as well as milk cows, but dairying was developed first. In 1940 the annual production of butter was 7,000,000 pounds, cheese 12,000,000 pounds, ice cream 1,500,000 gallons. The receipts from all sale of livestock and livestock products in 1944 amounted to \$76,979,400. The value of all farm products sold and used by farm households was \$360,945,000. The legislature in 1944 authorized the establishment of facilities for processing, storage, and marketing to be operated under cooperatives with a limitation from the state not to exceed \$10,000 for any one unit. The Mississippi Agricultural and Industrial Board has approved (1947) a plan for a large central market to be built and controlled by the state and operated by individuals or cooperatives on an equal basis.

Timber is Mississippi's second major crop. Thoughtless cutting, waste, and poor fire protection have been ruinous, but in 1932 the state awoke to the danger, and the timber volume has been only increased. The taxable sales value of finished forestry products has increased from \$3,713,252, in the fiscal year 1940-1941, to the average annual value of \$124,328,427 for the three fiscal years following. In 1943, Mississippi ranked first in the nation in hardwood lumber production, with 604,030,000 board feet, and seventh in softwoods, with 1,029,974,000 board feet. Forestry is the greatest industrial labor force in the state, with 43 per cent (in 1947) of all industrial labor in the woods and plants in lumber manufacture forest products. Some 14 per cent of the revenue of the state comes from forests.

The most spectacular and newest development in mineral extraction has been in oil. The search

for commercial production began as early as 1892. New impetus was given by the discovery of the Jackson gas field in 1930. On Sept. 8, 1939, the first well was brought in at Tinsley field in Yazoo County. This now has 310 producing wells. This was followed in rapid succession by other locations. The total cumulated production of oil as of May 1945 was 90,050,795 barrels.

In 1932-1933 came the nationwide economic depression and its New Deal remedies. Business began to look toward decentralization. New sources of fuel and power (gas and TVA electricity) were opening up in Mississippi. Its large supply of cheap labor, moderate climate, and lower standard of living began to be eyed by northern and eastern industrialists. In 1936 the legislature passed an act to "balance agriculture with industry" as a special inducement to out-of-state capital. Communities were empowered to offer land, buildings, and five-year tax exemption. The state advertised this highly and successfully.

Under this plan twelve industrial plants were erected, among them the Ingalls Shipbuilding Corporation, Pascagoula, and the Armstrong Tire and Rubber Company, Natchez, four hosiery mills, three shirt factories, a chenille concern, a woolen goods mill, and a plywood plant. Even before this, however, a few companies developing timber products had been established. Because of World War II this program was abolished.

As the war drew to a close, the plan was revived. In 1944 the legislature created the agricultural and industrial board to industrialize the state. The movement is gaining momentum and bids fair to succeed.

Transportation and Communications.—The Delta and the Chicago and Southern lines are the main instruments of air travel in Mississippi. The former operates between Charleston and Dallas; the latter between New Orleans and Chicago. Both stop regularly at Jackson. In 1944 there were 32 airports in the state, some equipped for night flying.

Mississippi has finally developed an elaborate system of good roads and highways, but it has taken a long time in the accomplishment. They were placed under the state highway commission in 1916. The first planned program of road building was approved by the legislature as late as 1936. At that time the state issued notes amounting to \$23,000,000 for the purpose. This was met by an allocation of the federal government in the amount of \$19,500,000. Approximately 4,500 miles of hard-surfaced roads have been the result. In 1945 the total road mileage was 63,287 miles. The cost of maintenance is borne by the gasoline tax and the license tax on motor vehicles.

Railroad building began on a small scale in 1831, but during the War Between the States the railways were destroyed. The new period of construction came from 1880 onward. Facing the competition of automotive transportation, the railroads began about 1940 to introduce streamliners with rapid and attractive accommodations. In 1944 the railroad mileage was approximately 4,000 miles. The major lines are the Illinois Central; Gulf, Mobile, and Ohio; Southern; and St. Louis and San Francisco. A number of smaller systems are being gradually absorbed by the larger.

MISSISSIPPI

Water transportation in Mississippi is less important than it was before the War Between the States, when it was one of the chief modes of travel and transport. The Mississippi River was of particular consequence, but the Tombigbee, Pearl, and other streams were also used. There are still in some use ports along the Mississippi and on the coast.

Telephones and telegraphs are accessible to nearly all communities in the state, the former being part of the Southern Bell system, the latter chiefly Western Union.

Economic and Financial Factors.—On March 20, 1945, there were 23 national and 179 state banks, holding total assets of \$665,287,856.54. State revenue comes from taxation, 34.89 per cent of the total being from the sales tax of 2 per cent. Other important taxes are income, tobacco, and general property tax, constituting respectively 15.49 per cent, 11.84 per cent, and 10.21 per cent of the revenue. Minor taxes account for 18 per cent and the remainder comes from refunding bonds, penitentiary sales, land redemptions, and other sources. Mississippi has a poll tax.

From 1890 to 1932 the financial program of the state was unsuccessful. In 1932 the sales tax was adopted and a program of rigorous economy was instituted. On June 30, 1946, the total state indebtedness amounted to \$62,829,000 (\$17,610,000 direct obligation; \$45,219,000 highway bonds). The treasury reported as follows for the fiscal year 1945-1946:

Balance in treasury, beginning of fiscal year 1945-46	\$ 26,539,990.68
Receipts, 1945-46	76,840,964.04
Total	\$103,380,954.72
Disbursements, 1945-46	71,867,368.17
Balance, beginning of fiscal year 1946-47 \$	31,513,586.55

Government.—Executive.—The basic law of Mississippi is the constitution of 1890, with subsequent additions and amendments. The governor is elected quadrennially and may not succeed himself.

¹ Died in office.

² Lieutenant governor.

³ Resigned.

⁴ President of Senate

⁵ Removed from office

Legislative and Judiciary.—The bicameral legislature, composed of 49 senators and 140 representatives, meets every two years on the Tuesday after the first Monday in January. The sessions meeting in leap years are unrestricted in scope and duration, but others may deal only with revenue, appropriations, and such matters as the governor shall submit for consideration. The state is entitled to 2 senators and 7 representatives in the United States Congress. The Supreme Court is made up of 6 judges elected for a period of 8 years. Other courts are the 17 circuit and 11 chancery courts with judges elected for 4-year terms.

Suffrage.—Voting is by secret ballot. Voter must have had legal residence in the state two years and in the election district one year, and must not have been convicted of certain crimes. Poll tax for the previous two years must have been paid and the voter must have registered. The voter may be asked to read, understand, or interpret a section of the state constitution. Officials are nominated by party primaries, the expenses of which are borne by the party. Normally, nomination in a Democratic primary is tantamount to election.

Public Health and Welfare.—The state board of health sponsors 65 full-time health departments aided financially by the county boards of

supervisors and city officials. This program of disease prevention is estimated at serving 84 per cent of the population. As a result the total death rate in Mississippi was 9.5 per thousand in 1944, while that of the United States was 10.6. Of public welfare institutions, Mississippi has charity hospitals in Jackson, Vicksburg, Meridian, Natchez, and Laurel. There are two state hospitals for the insane, one near Brandon, the other in Meridian, and a state school for the feeble-minded at Ellisville. Two schools, one for the deaf and one for the blind, are in Jackson. "Beauvoir," the Jefferson Davis shrine, still shelters with state support a few widows of Confederate soldiers. There is a tuberculosis sanatorium near Magee.

The Industrial and Training School, Columbia, cares for white orphans, delinquent children, and children of indigent parents, on the basis of court commitment. There is also a Negro juvenile reformatory at Oakley. The state has a prison farm, Parchman, considered by the Library of Congress as a major source of Negro folk music.

Other private and denominational charitable institutions are: Orphan's Home, Children's Home Society, Old Ladies' Home, Old Men's Home, and Baptist Orphanage, Jackson; Palmer Orphanage (Presbyterian), Columbus; D'Evereux Hall Orphan Asylum, St. Mary's Orphan Asylum, and Protestant Home, Natchez.

Local Government.—The three main types of municipalities are code chapter, commission, and private charter. Twelve cities are governed by commission, the remaining 258 by mayor and aldermen. No city manager government exists yet within the state.

Educational System.—Public Education.—All the state colleges come under one Board of Trustees of Institutions of Higher Learning. They are: the University of Mississippi, Mississippi State College, Mississippi State College for Women (Columbus), Mississippi Southern (Hattiesburg), Delta State Teachers (Cleveland), Alcorn Agricultural and Mechanical (Lorman) for Negroes, and Mississippi Negro Training School (Jackson).

The elective state superintendent of education is the executive head of the public school system. During the school year 1943-1944, Mississippi had 5,000 public schools, white and colored. Stress is placed on consolidation. Free textbooks are provided through the 12 grades. There are 12 agricultural high schools and 12 publicly supported junior colleges. The development of Negro education is receiving emphasis. All Negro schools are taught by Negro teachers. Handicapped children are trained under a program of the Vocational Rehabilitation and crippled Children's Service.

The legislature in the sessions of 1946 and 1947 made appropriations totaling \$38,098,553.46 available for the program of education. This figure does not include grants from the federal government nor revenues raised by county and district taxation.

Private Education.—The Roman Catholic Church has approximately 30 parochial schools, including some for Negroes and Indians. The Baptists have a mission school for Chinese at Cleveland. Two small academies are run by the Presbyterians, Chamberlain-Hunt (Port Gibson) and French Camp. All Saints (Vicksburg) is an Episcopal junior college for girls.

There are two girls' colleges, Belhaven (Jackson) and Blue Mountain, under the auspices respectively of the Presbyterians and Baptists. Millsaps College (Methodist), Jackson, and Mississippi College (Baptist), Clinton, are coeducational. The Roman Catholic bishop of Natchez holds an endowment fund for the education of young men for the priesthood. At Bay St. Louis is a major seminary, St. Augustine's, for the training of Negro priests.

Libraries.—Most of the towns and counties have small lending libraries which received tremendous impetus under the Works Progress Administration (1935-1942). The improvement of many educational features have been due in large measure to the Mississippi Educational Association and the Parent-Teacher Association. The library of the State Department of Archives and History at Jackson is excellent for research. It has special collections of Mississippi and American history. The University of Mississippi Library is well equipped and has special collections of Mississippiana, political science, and international law. The Ricks Memorial Library at Yazoo City has a fine collection of first editions.

History.—Before Mississippi was known to Europeans, and for some time thereafter, it was inhabited by Indians. The Chickasaws were in the north and the Choctaws in the central portion and south. In the southwest were the aristocratic Natchez, related to the highly civilized Indians of Mexico. There were other smaller tribes.

The first appearance of Europeans in this land was in December 1540 when Hernando de Soto and his followers entered. They spent the winter of 1540-1541 in northeastern Mississippi before discovering the river in May 1541. The next were the French priest and trader, Jacques Marquette and Louis Jolliet (1673), who had some contact with the Chickasaws but did not remain long. French interest was continued by Sieur de La Salle who reached the mouth of the river and claimed the valley for Louis XIV, naming it Louisiana in his honor. Father Zenobius Membré celebrated for this party on Easter Sunday, 1682, near the site of Fort Adams, the first Mass in Mississippi. There were other explorers, but no permanent settlement was made until 1699.

In that year Pierre Lemoyne, Sieur d'Iberville, established Fort Maurepas, near the site of Biloxi. From that date until 1763, Mississippi was a part of the French colony of Louisiana, ruled first from Mobile, then Biloxi, later New Orleans. The second location was Fort Rosalie (Natchez) in 1716, and others followed. Women were brought from France as wives for the colonists. Many successful companies were formed to promote immigration. The Scottish adventurer, John Law, created great European interest in 1717 by his speculation which later (1720) fell into disrepute as the "Mississippi Bubble."

British ambition was aroused. As a result of the Seven Years' War and the Treaty of Paris (1763) the country came under British domination as West Florida, governed from Pensacola. Many Anglo-Americans who received land as payment for military services moved in from the Atlantic seaboard. France out of the way, the Anglo-Americans now faced the Spaniards who meanwhile had acquired New Orleans and Louisiana west of the Mississippi River.

During the American Revolution, the Natchez region was relatively neutral and indifferent to the conflict. The Spanish, taking advantage of the situation, moved in and took (1779) Fort Rosalie (Natchez), called Fort Panmure by the British. The American settlers were amenable to the change and took the oath of allegiance to Spain. The territory remained in Spanish hands officially until 1795 and virtually until 1798, except for a short-lived rebellion of the British colonists in 1781-1782.

By the second Treaty of Paris (1783), Britain relinquished its claims north of latitude 31° to the United States, but Spain refused to recognize this transfer. The situation was further confused when the State of Georgia laid claim to the territory, erected it into the county of Bourbon (1783-1788), and later (1795) sold the land. Ultimately the federal government had to redeem the claims obtained in the notorious "Yazoo fraud."

The issue between the United States and Spain was adjudicated in the Treaty of San Lorenzo (1795), Spain relinquishing the land north of latitude 31°. There was considerable delay in running the line of demarcation. Finally the American surveyor, Andrew Ellicott, arrived, February 1797, but now the Spanish governor delayed, not surrendering the government until March 1798.

On April 7, 1798, the federal government made Mississippi a territory. The land problem was made chaotic by conflicting claims based on French, British, Spanish, and Georgia grants. The intrigues of Aaron Burr and James Wilkinson kept the land in confusion. Indian trouble was brewing, until defeats at the Holy Ground (1813) and Horseshoe Bend (1814) were inflicted by Andrew Jackson. Meanwhile the country was at war again with Britain (1812-1815), ending with the success of Jackson at the Battle of New Orleans. Statehood was finally achieved, Dec. 10, 1817.

This was now a fast growing frontier. The population increased from 40,352 (1810) to 75,448 (1820). The state capital was finally located at Jackson (1822). Two thirds of the state were still in Indian hands, but the Indians gradually ceded their lands to the state and were removed.

This period was the heyday of the famous bandits, Hare, Mason, Murrell, the Harpes, and others. It was also the flush times of land-grabbing, financial speculation, panic, and repudiation, in a raw, new country. A great deal of this rambunctious energy went into the support of Texas independence, the Mexican war, and filibustering in Cuba. But much also went into national politics, the discussion of nullification, and the extension of slavery. However, by 1850, the forces of law and order had gradually made themselves felt. A latently aristocratic and feudal society was beginning to take shape in the more settled communities of the state. It did not last long.

The question of secession could not be suppressed. The election of Lincoln and the action of South Carolina was quickly followed by the dissolution of Mississippi's relation with the Union, Jan. 9, 1861. Jefferson Davis, one of the United States senators representing Mississippi, became the president of the Confederate States. The census of 1860 showed 70,295 white men in Mississippi between the ages of 18 and 45,

yet the enlistments of Mississippians in the Confederate armies has been estimated at 78,000.

The major operations of the Union forces in Mississippi were the capture of Corinth (1862), the campaign for Vicksburg (1863) culminating in its surrender, and the destruction of Jackson and Meridian. The end of resistance came May 4, 1865.

By presidential proclamation, William L. Sharkey was made provisional governor. A new constitution was adopted, under which Benjamin G. Humphreys was elected governor. Congress declined to accept the mild presidential reconstruction. A military government was established. Humphreys was ejected from the executive mansion and Gen. Adelbert Ames became the military governor. A reign of extravagance and corruption produced another constitution which was at first defeated by the people.

By a process of concession and pressure it was finally accepted. James L. Alcorn, a former Confederate general, was elected governor. He was succeeded by Ridgley C. Powers. Disagreement arose between two Republican factions led respectively by Ames and Alcorn, and Ames became governor again. Under him Negro power reached its zenith. The lieutenant governor, A. K. Davis, and other prominent officials were Negroes. Violence and rioting broke out in Meridian, Vicksburg, and Clinton.

The election of 1875 was a veritable revolution, returning a majority of Democrats to the legislature. In January 1876, that body set itself the task of removing the radical officials. Davis was deposed, Ames resigned under fire, and the reconstruction came to an end. With the accession of John M. Stone (1876), the state government has been Democratic ever since. To destroy the last vestiges of this period, a new constitution was adopted in 1890, under which the state still functions.

Back in power, the Democrats developed a tension never quite amounting to a split in the party. Two vaguely defined groups resulted, the old established group on the one hand, on the other the poorer farmers and plain people. The common man increased his influence during the administrations of Governors Vardaman, Noel, Bilbo, and Johnson.

Advantageous programs sponsored by recent governors have been numerous. Conner's sales tax practically solved the state's financial problems. White, Bailey, and Wright have gone a long way toward balancing agriculture with industrial development. Even in agriculture vast strides have been made. The state is rapidly being relieved of its bondage to cotton and diversification is well under way. Good modern highways have been constructed and electrification is practically universal.

From 1890 to the present have occurred three wars, the Spanish-American and World Wars I and II. In all of these Mississippi has contributed its share. During the last, one of the largest induction centers was Camp Shelby near Hattiesburg, where at the height of its service 120,000 troops were stationed.

J. ALLEN CABANISS,
Associate Professor of History, University of Mississippi.

MISSISSIPPI, mis-i-sip'i, river, United States, is the great river of North America, and with its far-reaching tributaries embraces one of the major river systems of the world. Long ago, Ojibway Indians, roaming the forests of Wisconsin, called it Missi Sipi, which in their musical language meant the Great River. In the lower valley, where the impetuous current swollen in flood time overflows its banks to convert millions of acres of fertile land into a moving sea, other tribes termed it the Father of Waters. Both names were appropriate, for the scope and volume of this vast stream has made it almost a synonym for great rivers everywhere: even the Volga has been termed the Russian Mississippi, and by a more doubtful comparison, the Murray-Darling, has been called the Mississippi of Australia.

An excursion into Recent geological time reveals a different Mississippi, although one quite as interesting. What is now its lower basin was once a prolongation of the Gulf of Mexico, and Cape Girardeau in Missouri then deserved its name, for it was a bluff promontory overlooking the prehistoric sea. This gulf eventually became filled with wind-swept glacial dust which in places accumulated to a depth of several hundred feet, together with the silt borne downward from the eroded uplands by the turbulent waters.

Meanwhile, the upper branches of the river were undergoing an even more extensive transformation. As the continental ice field, which had crossed the valley of the Ohio, slowly retreated before an increasing climatic warmth, its formidable ramparts still dammed up all northward egress, so that its melting waters were forced to seek an outlet to the south. How extensive were these waters may be inferred from the fact that several of the Great Lakes became united in one super lake, while another vast expanse called Lake Agassiz, nearly four times as extensive as Superior, sprawled across Minnesota into North Dakota and reached farward into Canada. Meanwhile, the Missouri, the major branch of the Mississippi system, seems to have gone wandering off on its own empty into Hudson Bay. Before the Great Lakes subsided into something like their present shorelines, two of them, Superior and Michigan, flowed for a time into the Mississippi. So also did Agassiz until much of its volume had drained away. Eventually its major remnants—the Lake of the Woods and Lakes Winnipeg, Winnipegosis, and Manitoba in Canada—were captured by the Saskatchewan, while Superior and Michigan turned eastward to join their kindred Great Lakes in the valley of the St. Lawrence. Many smaller remnants of huge Agassiz, however, still dot Minnesota forests, remained within the original system, and among them the upper Mississippi still finds its source. To compensate partially for the loss of its big lakes in this period of changing watersheds, the Missouri turned eastward and the entire system began to assume something of its present form and magnitude.

If we view a map of North America with

all man-made boundaries eliminated, we shall observe that the Mississippi system seems to cut an enormous wedge out of the heart of the continent, a wedge comprising 1,243,000 square miles. Southward it narrows to the State of Louisiana and becomes still more restricted as it pours its waters through the several mouths of its narrow delta into the Gulf of Mexico. But to the northwest its remotest tributaries drain the mountainous borderland between Idaho and Montana, while to the northeast the Allegheny branch of the Ohio taps the water sources of western New York. Although it penetrates into the Rockies eastward and courses the wooded valleys of the Appalachians, the Mississippi system primarily drains the alluvial grain belt of the Middle West and that vast area known as the Great Plains. The watery surplus from 31 states and two Canadian provinces swells its current. Of its hundreds of tributaries no fewer than 45 are navigable for at least 50 miles of their course, providing a combined system of waterways which exceeds 15,000 miles.

More than most rivers, the Mississippi has suffered from a mistaken nomenclature. The main trunk is formed by the union of three great branches, and of these the upper Mississippi, which has given its name to the entire system, is the least impressive. There was a time when it drained the vast lakes of the melting ice fields that it deserved such major rating. But when it lost those lakes to the predatory Saskatchewan and St. Lawrence it also lost its priority; for it yields to the Missouri in length and the extent of its drainage basin, and it yields to the Ohio both in drainage basin and the volume of its waters. This fact is recognized in measuring the length of the system which is always reckoned from the headwaters of the Missouri.

A glance at some statistics will illustrate this comparison. The upper Mississippi to its junction with the Missouri drains an area of 171,500 square miles. In contrast, the Missouri, longer by nearly 1,600 miles, drains an area more than three times as extensive, or approximately 530,000 square miles. Even the drainage basin of the Ohio is 202,000 square miles. The upper branch of the great river was merely the first to come to the attention of exploring white men. A similar situation has occurred elsewhere, which emphasizes the fact that while river systems are geographical, their names are merely historical and subject to confusion and error.

The source of the upper Mississippi is usually given as Lake Itasca in northern Minnesota. More accurate surveys, however, have traced its ultimate beginnings to Elk Lake and one or two lesser bodies of water which empty into Itasca. The region abounds with glacial relics where river stability is still emerging from the confusion following the ice age. From this elevation of 1,670 feet above the sea, the river winds through swamps and forests, descending by numerous rapids and gaining volume from the spillways of other lakes. At one point it approaches fairly close to the St. Louis River which marks the headwaters of the St. Lawrence. From the Falls of St. Anthony, where the river falls 65 feet in three quarters of a mile—a series of rapids which are broken by a sheer drop of 18 feet—it emerges as a navigable stream all the way to the sea.

As it descends from the continental plateau with its ancient rock formations and relatively

thin covering of soil, the Mississippi presents much varied and pleasing scenery. At times it broadens into such lakes as Pepin; other times it is flanked by precipitous heights called bluffs that may rise 300 feet or more. At several places the current is interrupted by other series of rapids. Above Rock Island there is a descent of some 22 feet; the mouth of the Des Moines River is marked by another of 24 feet; while over a 12-mile stretch approaching Keokuk the river again descends 24 feet.

Geographically, the true source of the Mississippi, however, lies far away on the western borders of Montana. There three considerable streams, the Madison, the Jefferson and the Gallatin, unite to form the Missouri. Fed by the melting snows and gushing springs of the Rockies in the tangled watershed which separates Montana from Idaho, it sweeps on through the wide open spaces of the great Northwest, its branches adding picturesque touches to some of the grandest scenery on the continent. One of these tributaries is the Yellowstone which courses among the geysers, hot springs, and painted gorges of a scenic wonderland. Arching northward, the Missouri sends other branches across the border into the two Canadian provinces of Alberta and Saskatchewan. Bending southward, it meets such tributaries as the Platte, often choked with sand bars. Since much of the territory through which it passes has an annual rainfall of 20 inches or less, the volume of the Missouri varies enormously. In times of flood it discharges more than 800,000 cubic feet a second; in times of excessive drought, it has shrunk to barely 13,000 cubic feet. Such violent aberrations make it one of the most ungovernable of rivers, but its normal volume exceeds the smaller but steadier flow of the upper Mississippi. Where the two rivers unite, they maintain their individuality to a singular degree for more than a hundred miles, the yellow waters of the Missouri being distinguishable as they flow beside the clear waters of the upper Mississippi. Eventually, however, the shifting of the channel from one side of its bed to the other mingles these discordant elements.

Some 200 miles to the south the great twin rivers of the north unite with their eastern branch, the Ohio. This river, formed by the junction of the Allegheny and the Monongahela, is nearly 1,000 miles in length. From Olean, N. Y., on the Allegheny, a river steamer may proceed all the way to Great Falls, Mont., on the Missouri, 4,000 miles from east to west, a distance which nearly spans the continent. The Ohio and its many tributaries drain the ridges and valleys of the Appalachian Mountains where the scenery, though less grand than along the upper Missouri, is less empty and desolate. Here the rainfall exceeds 40 inches annually, or more than twice that in the larger basin of the Missouri, so that the Ohio pours a greater volume of water into the Mississippi system than either of the other main branches. Among its many contributing streams the Tennessee, the Wabash, and the Cumberland are noteworthy.

Farther south the Mississippi attracts other tributaries. Chief among these is the Arkansas whose drainage basin, 187,000 square miles, is larger than that of the upper Mississippi itself. Another considerable affluent approaching from the west is the Red River with a drainage area of 93,000 square miles.

Some 30 miles above the junction of the Ohio and the Mississippi, the topography changes decidedly. Here the upland plateau terminates and the river enters an alluvial valley largely of its own creation, through which it meanders for some 1,100 miles to the sea. Through this valley it advances in a series of broad loops and horseshoe bends necessitating a frequent diversion of the current from one side to the other, forming shifting mud bars and frequent changes in the channel. In its lower course these horseshoe bends are sometimes cut through leaving semi-circular lakes or lagoons. Meanwhile, new curves and horseshoe bends which the restless waters gouge out of the yielding soil are continually forming. The entrance of the Red River presents a picture even more confusing. This river once flowed into the Atchafalaya which roughly paralleled the lower Mississippi. But the old mouth silted up and the Red River opened its present outlet to the Mississippi. From this point all the way to the Gulf Mexico the river in flood loses itself in a maze of cross channels called bayous, characteristic in newly made land formed of recently deposited silt. All this region might properly be termed delta since it fills the original oceanic trough; but the obvious delta extends far into the sea in a crowfoot formation of quaking mud and marshland. Here, during the past century and a half, some 50 square miles of land have been added to the State of Louisiana.

The head of this advancing formation broken by five distinct outlets to the sea. These are known respectively as Southwest, South Southeast, Northeast and North passes. The main volume of waters pours through Southwest Pass, but more accessible South Pass is the channel usually preferred by ocean shipping.

The volume discharged by the Mississippi varies greatly. The maximum reported by the Mississippi River Commission occurred on April 28, 1927, a total of 1,557,000 cubic feet a second. The minimum recorded on Nov. 1, 1939, had shrunk to 49,200. The mean annual output is given as 513,000 cubic feet a second, about one third the maximum, but more than ten times the minimum.

From the Ohio River to the Gulf of Mexico the width of the Mississippi, though occasionally broadening to a mile and a half, usually ranges between 800 and 1,500 yards. Below its juncture with the Red River it narrows to 300 yards for a considerable distance. Although this width compares unfavorably with the expansive shorelines of the great Siberian rivers and with the oceanic horizons of the Amazon, the Mississippi is quite deep, its channel ranging usually from 50 to 100 feet or more.

The length of the Mississippi has long been a theme for argument. Most atlases give this as 4,200 miles, and add that it is the longest river in the world. The Mississippi River Commission, however, reduces this figure to a more moderate and more exact 3,986 miles from the farthest headwaters of the Missouri to the delta outlet at the sea. This is topped slightly by recent reports which give the extreme length of the Nile, including its lake interruptions, as 4,053. Moreover, the length of the Mississippi continues to be a variable factor. Horseshoe loops are cut through, reducing the figure which swells again by the creation of new loops as the river meanders down its lower valley. How considerable

such variations may be shown by the fact that within recent years a series of such cutoffs has reduced one stretch of river channel from 330 to 210 miles.

History.—Early explorations in the Mississippi Valley are of historic interest. It is believed by some that Columbus' sailors may have sighted the river, for its mouth is indicated on the admiral's map of the region made in 1507. Fernando de Soto, however, is usually credited with its discovery. Advancing all the way from the Atlantic seaboard, de Soto and his band of adventurers reached the banks of the river somewhere in the present State of Mississippi in the year 1541. Disappointed in the quest for gold which lured the conquistadors to incredible hardships, de Soto died there and was buried, and the river remained for over a century little more than a legend and a name on the distorted and most formless maps of the New World.

In 1673 the French missionary explorers Father Jacques Marquette and Louis Jolliet, venturing westward from Lake Michigan, voyaged down the Mississippi for 300 miles or more, passing the mouth of the Missouri. In 1682, René Robert Cavalier, sieur de La Salle completed this voyage of discovery by sailing down the river to the sea. Naming the present area of Louisiana for his sovereign, Louis XIV of France, he dreamed of founding a vast French empire in the wilderness, but his ambitious schemes were cut short in 1687, when, during a second trip to the mouth of the Mississippi, he was murdered by his mutinous followers. Under his instructions Michel Accault had also ascended the upper Mississippi to the Falls of St. Anthony.

That picturesque character, Pierre Radisson, whose highly colored stories of the wealth of the Canadian wilderness led to the organization of the Hudson's Bay Company, may have sighted the Missouri while on an expedition to the Lake Superior region. At least he may have heard of the river through Indian traders from what he named the land of "the beef" where great herds of bison ranged. But the honor of discovery is usually conferred upon Pierre Gaultier de Varennes, sieur de La Vérendrye, and his sons, who tried French arms and civilization into the western forests, although they are better remembered for the fort which they established on the shores of the Lake of the Woods and as founders of the city of Winnipeg. In 1797, David Thompson, exploring for the North West Company of Canada, descended a stretch of the Missouri, but it was Meriwether Lewis and William Clark, on their expedition to the Pacific coast during the years 1804-1806, who really introduced the river to the outside world. They extended it for long distances, then changing their operations to the Columbia, followed that river to the sea.

It would be difficult to exaggerate the influence of the Mississippi upon the development of the United States. Basically, it is the drainage system of more than one third of the country, carrying the surplus rainfall of that semitropical to the Gulf of Mexico. In the formative period of the country, its waterways provided the major means of transportation. The canoes the Indians were gradually supplanted by every conceivable type of craft that the ingenuity of the pioneer could devise. Of these the simplest was the log raft. For decades northern timber was thus ferried to the South, usually bearing

cargoes of merchantable produce. A voyage to New Orleans on such a raft gave Abraham Lincoln an insight into human slavery which was destined to have momentous consequences. Such one-way traffic was soon followed by the era of the river steamboat, a romantic period dramatized by Mark Twain, himself a river pilot, who adopted his pen name from the leadsmen's cry of "by the mark twain," or a two-fathom depth across some shoaling sand bar.

The first river steamboat to follow the route of La Salle left Pittsburgh for New Orleans in 1811. Among the hazards of the voyage, it seems to have become involved in the earthquake disturbance which changed the bed of the river at one point and created Reelfoot Lake. By the year 1857 when this type of navigation reached its height, no fewer than 1,100 river steamers called at St. Paul, while the number on all the tributaries was estimated to swell that total to 3,000 or more. In voyages up the Missouri, pilot houses were made bullet proof, as roving bands of Pawnees or Sioux sometimes resented this intrusion of the white man. A colorful development of the period was the show boat which carried theatrical entertainments to settlements along the shores.

Steamers still ply the Mississippi, but the day of their supremacy has passed. Not a few old favorites were broken up and transferred half way around the world, to be reassembled on other rivers, such as the Congo and the Irrawaddy.

The lower reaches of the Mississippi remain a busy thoroughfare and ocean liners from all parts of the world still assemble at New Orleans. The importance of the river and its principal tributaries as arteries of commerce is well illustrated by the great cities that have sprung up along their banks. Among these the most populous is St. Louis, but there are many others, including New Orleans, Memphis, Minneapolis, St. Paul, Kansas City, Pittsburgh, Cincinnati, Louisville, and Nashville.

Floods and Erosion.—While the great river has conferred benefits that are well-nigh incalculable, there is a darker side to the picture. Its waters sweep away a precious and irreplaceable fortune in soil erosion. In this work of depletion the Missouri has well earned its name of Big Muddy. On an average day, 275,000 tons of topsoil go swirling past the city of Omaha. In flood time a cubic foot of water may contain up to 42 pounds of silt. Disconsolate farmers viewing the ruin remark that this mixture is "too thick to drink, too thin to plow." The annual loss of soil through this one great branch alone is estimated at 240 million tons.

Such wastage is emulated in lesser degree by other tributaries, so that through its yawning mouths, according to the Soil Conservation Service, the Mississippi in flood sweeps away the equivalent of a 40-acre farm every minute.

The historian Garcilaso de la Vega (1539-1616), who described De Soto's expedition in his *La Florida del Ynca* (1605), has given us the first description of one of these episodes: "The flood was forty days in reaching its crest, which came on the twentieth of April. And it was a most magnificent spectacle to behold. That which previously had been forests and fields was converted now into a sea, for from each bank the water extended across more than twenty leagues of terrain." [Tr. by J. and J.

Varner (Austin 1951), p. 554.] This description is based on the account of one of De Soto's companions. Father Marquette in his voyage of 1673 was, however, less favorably impressed. "I have seen nothing more frightful," he wrote. "A mass of large trees . . . real floating islands. They came rushing so impetuously that we could not, without great danger, expose ourselves to pass across."

Several such floods have rated among national calamities. Perhaps the greatest of recorded times began in the autumn of 1926 and extended through the following spring. Another almost as disastrous occurred ten years later, in 1937. Heavy rains had deluged the valley of the Mississippi with an estimated 250 cubic miles of water, or nearly one quarter the content of Lake Erie. At Cairo, Ill., the river rose 56 feet. The lower valley became a lake nearly as extensive as Superior. The city of New Orleans was saved only by dynamiting the dikes and permitting some of the swollen waters to surge across the lowlands to the gulf. Meanwhile, three quarters of a million people were made temporarily homeless and property loss rose above \$350,000,000.

While the lower valley has always been the chief sufferer from such inundations, the railroad station at Cincinnati has sometimes been buried beneath 30 feet of water, and the 1951 flood in the Missouri caused enormous damage to Kansas City.

Flood Control and Navigation.—The control of the Mississippi poses a major problem. Two methods for its solution have been suggested, both simple in principle but difficult of application. The first would deepen the channel by employing the erosive force of the waters themselves, or, in other words, divert the vast energies of the river from agents of destruction to useful factors. Below the Missouri, hurdles of piles and brush extending from the banks have caught the sediment of that turbulent stream, restricted the width of the channel, and actually made new land.

Such methods, however, have proved less practicable farther south until the delta region is reached. There through South Pass the current, confined by side obstructions or jetties, has plowed out a channel 31 feet deep across shoals that once showed a depth of only 8 feet. For 20 miles Southwest Pass has been constricted between similar jetties to a width of 1,000 feet, later reduced to 600 feet, and a depth of 35 feet maintained. Through these outlets the furious current in flood has gouged out pockets 104 feet deep.

While jetties have proved their value in limited areas, a more effective method of flood control has been that long since developed in the Netherlands, where the encroaching sea has been thrust back and kept in bounds by dikes. To a degree the Mississippi raises its own dikes. As the river bed fills with silt, the banks are built up in a similar manner by the deposit of sediment from overflows, so that the surface of the water may be higher than the surrounding country. In the cemeteries of New Orleans tombs are built above the water-logged earth.

The first artificial dike, or levee as it is called, was erected at New Orleans in 1717 and the system gradually extended at intervals for 2,130 miles. Along exposed stretches of the upper river, dikes from 8 to 14 feet in height have sufficed, but along the lower river these rise to

24 feet, which is about as great a height as the unstable bases will support. That such shackles of the unruly river are at best precarious is recorded in reports of the late 1880's which show that the dikes were broken through in 712 places.

Along the Missouri where farmers watch acre after acre of rich soil caving into the muddy current, willow mats have been utilized to protect the crumbling banks. Modern engineering has supplemented these devices with articulated concrete mattresses of jointed concrete matting sometimes coated with asphalt. Salt has been strewn beneath to prevent the growth of water vegetation, and points of particular danger have been reinforced with stone riprap.

As far back as 1789 the federal government seems to have made its first appropriation for Mississippi River control, and that initial venture has broadened ever since. In 1879 Congress appointed the Mississippi River Commission under whose supervision the river and its branches have been more thoroughly studied and investigated than any other waterway of comparable area. At first, governmental appropriations were largely devoted to the maintenance of a minimum depth of channel for navigation purposes, and this was achieved by dredging operations. But it is now recognized that the only practicable method of control is to envisage the entire system as a unit, for a sudden influx of waters from any one of the major branches would upset the normal balance. Harnessing the Tennessee, a particularly unruly member of the Ohio system has been accomplished through the construction of more than a score of dams, while a similar series of barrages impedes the current of the upper Mississippi. Even more ambitious are plans to tame the Missouri by a series of no fewer than 105 dams designed to cost well over a billion dollars.

Meanwhile, river gages established at strategic points record fluctuations in current and volume that foretell well in advance any serious flood menace.

Although flood control has become a paramount issue, the loss of precious water through mad torrents that rush seaward spreading nothing but havoc has seemed to arid regions of the Far West a tragic waste. Water shortages in many localities have aroused a public consciousness of the extent to which our expanding civilization depends upon an adequate water supply. The building of dams conserves surplus water in artificial lakes which become reservoirs for irrigation projects. A certain dependability in the normal flow of the Missouri should supersede the chaotic era of alternate flood and sand bar.

The development of hydroelectric power is also an issue. Such natural power gave the upper Mississippi its prominence long ago when the Falls of St. Anthony attracted the first settlements at Minneapolis and St. Paul and made possible the great flour mills which brought early prosperity to those cities. Dams, though artificial, are quite as effective as natural waterfalls, and the energy which they develop (called by the Italians white coal), unlike most natural resources, is never dissipated.

In these extensive remodelings of a vast system of waterways, their original function as a means of navigation has not been neglected. The dams of the upper Mississippi tend to maintain a more even depth of current and are bypassed by canals so that steamers ascend readily to St. Paul. In fact, plans have been outlined for

greatly increasing the scope of river navigation. The city of Chicago has repeatedly sought legislation permitting the deepening of the channel through canal and river which would reunite Lake Michigan with the Mississippi, and link the vast commerce of the Great Lakes area with the central United States and the Gulf of Mexico. This reversal to conditions which prevailed during the waning of the ice age is opposed by other cities—Detroit, Cleveland, and Buffalo—which fear that the diversion of any great amount of water would lower the lake surfaces and imperil their own costly harbor facilities.

Quite as intriguing, though less likely to be realized, is the suggestion that a canal little more than a mile in length between Big Stone Lake on the Little Minnesota and Lake Traverse draining into the Red River of the North would provide an uninterrupted water route through the Saskatchewan system from the Gulf of Mexico to Hudson Bay.

In volume and in drainage basin the Mississippi ranks far below the Amazon or the Congo. Its commerce is but a tithe of that of the St. Lawrence with its fabulous empire of the Great Lakes. One might even draw unfavorable comparisons with the La Plata-Paraná of South America, with the giant rivers of Siberia, or with the Yangtze Kiang, the life line of China. But the Mississippi, both in magnitude and importance, remains one of the greatest of world systems, and to Americans it will always be what Algonquian tribes first termed it—the Mississipi or Great River.

FERDINAND C. LANE,

Author of "Earth's Grandest Rivers."

MISSISSIPPI, University of, at University, Miss., near Oxford, was chartered Feb. 23, 844, and opened for its first session Nov. 6, 848, with four faculty members and 80 students, under George Frederick Holmes as president; since that time it has operated continuously except for the four years of the Civil War, and since 1882 it has been coeducational. Maintained by the State of Mississippi, the university is governed by a board of trustees, made up of the governor of the state and 13 other members. The institution is a fully accredited member of the Southern Association of Colleges. In addition to the original College of Liberal Arts, the university now comprises, in the order of their establishment, schools of law, engineering, education, medicine, pharmacy, and commerce and business administration, and a graduate school. There is also an extension division and departments of music, home economics, and military science and arts.

More recent additions are the departments of journalism and office administration. The engineering curriculum has been modernized and bureaus of business research and educational research established. The university library has several thousands of volumes and documents of

Mississippiana and the Gardner Collection of Political Science. The 60-acre campus forms part of the 640 acre tract of wooded hills. The University also owns some 23,400 acres elsewhere. The average yearly enrollment is 2,700.

MISSISSIPPI BUBBLE, The, an historical novel by Emerson Hough, published in 1902, and centered around one John Law of Lauriston, adventurer, gambler, and financier. More than one writer has woven his tale around this intriguing hero. Mr. Hough has followed history fairly closely. John Law, penniless and on foot, journeys to London, begging a ride for the last few miles in a coach occupied by two women. These two women greatly influenced his life, as is shown in the book's subtitle, "How the star of good fortune rose and set and rose again, by a woman's grace for one John Law of Lauriston."

The review in *The Bookman*, from which we quote, was published in June 1902, and concerns itself with Law the gambler, the soldier of fortune. "History records the unfortunate duel which destroyed Law's prospects at the outset, his imprisonment in Newgate, his escape, and his reappearance many years later in France as the founder of the famous 'system' and promoter of the 'Mississippi scheme' which, bursting, left a wreckage unparalleled in the annals of finance. Mr. Hough's bold innovation consists in accounting for the intervening years by making Law, a fugitive from justice, bury himself in the wilds of America, joining a band of intrepid voyageurs and pushing on westward and southward to the unknown lands beyond the Mississippi. Here Law beholds the boundless expanse of rolling prairie, of a fertility never yet put to the test; he sees some acres of maize, thinly sown by Indian women, a plant never yet seen by European eyes, and his far-seeing mind of economist and financier grasps at a bound the limitless possibilities of wealth spreading out before him—a drama since realized, of the West converted into a vast granary, rolling its flood of golden grain across the Continent and across the ocean to bring renewed prosperity to European nations. This is the dream which the John Law of Mr. Hough's imagination carries back with him to France; it is this on which he bases his 'system' and his Mississippi Company and all the rest of the financial schemes which ended so disastrously. According to the author's conception, Law was an economist far in advance of his time; his methods were sound and should have been successful, had not the Regent, in defiance of his advice, flooded the market with worthless paper and precipitated a panic." See also LAW, JOHN; MISSISSIPPI BUBBLE (financial scheme).

MISSISSIPPI BUBBLE, a celebrated financial scheme, projected by John Law (q.v.) at Paris in 1717. Law issued shares for a vast company to be called the Compagnie d'Occident, and to be engaged in the colonization and cultivation of the banks of the Mississippi. Reports skillfully spread as to gold and silver mines discovered in these parts raised in the people the hope of great gains. The company soon absorbed those of the Senegal and the East Indies, and took the new title Compagnie des Indes. Such were the hopes raised by this undertaking that the shares originally issued at \$100 were sold at 10, 20, 30, and 40 times their value. Law had promised to the regent that he would extinguish

the public debt. To keep his word he required that the shares in this company should be paid for one fourth in coin and three fourths in *billets d'état* or public securities, which rapidly rose in value on account of the foolish demand which was created for them. In October 1719 the shares mounted as high as \$4,000. The state took advantage of the popular frenzy to issue increased quantities of paper money, which was readily accepted by the public creditors and invested in shares of the Compagnie des Indes. This went on until the value of the paper money in circulation was more than three milliards, while the value of coined money was no more than 700 millions. Before this stage was reached Law himself who had originated the idea of paper money had endeavored to check the issue but his efforts were unavailing. A catastrophe was now inevitable. About the end of 1719 the more prudent speculators began to sell out. In payment of their shares they received, of course, in great part, *billets d'état*, and with these bought gold, silver, diamonds, lands or anything else having a real value. As the *billets* became depreciated such articles as tallow, soap, etc., were often bought at fabulous prices. Law struggled desperately against the fall in the value of these shares, but all his devices to check their downward course were futile or had only a temporary success, and when the state finally declared that it would receive no further payments in paper, he perceived that all attempts to bolster up the scheme were in vain, and made his escape from France (December 1720). The affairs of the company were wound up by the state acknowledging itself debtor to the creditors of the company to the amount of \$340,000,000. The public debt was augmented by \$2,600,000 of "annual rentes."

MISSISSIPPI COLLEGE, at Clinton, Mississippi. A private coeducational institution, it was founded as Hampstead Academy under charter of the state legislature in 1826. Renamed Mississippi Academy in 1827, it assumed its present name in 1830. After more than a decade of municipal management, control of the college was assumed by the Clinton Presbytery in 1842; its present owners, the Mississippi Baptist Convention acquired it in 1850. The convention controls its policies through a board of 15 trustees, elected for three-year terms.

The college's 30 buildings, including the Old Chapel (1859) and a new administration and classroom building, are situated on a 300-acre campus. Four undergraduate degrees are conferred (B.A., B.S. in Ed., and B.M.) and the M.A. degree. Preprofessional training is given to students planning careers in medicine, dentistry, nursing, law, teaching, engineering, and theology. The college endeavors to develop in students the highest standards of scholarship and Christian character. It has full accreditation including membership in the National Commission on Accrediting and Southern Association of Colleges and Secondary Schools. There are 52 faculty members. Enrollment averages 1,200.

MISSISSIPPI SCHEME. See **MISSISSIPPI BUBBLE**.

MISSISSIPPI SOUND, an arm of the Gulf of Mexico, extending along the coasts of Mississippi and Alabama from Bay St. Louis on the east to Mobile Bay on the west and connect-

ing with the latter by Grants Pass. It is about 100 miles long, from 7 to 15 miles wide, from 6 to 10 feet deep, and is formed by a chain of low, narrow, sandy islands, chief of which are Dauphin, Petit Bois, Horn, Ship, and Cat. It is traversed by steamers and coasting vessels trading between New Orleans and Mobile.

MISSISSIPPI STATE COLLEGE, in the northeast part of Mississippi, near the city of Starkville, was established as the Mississippi Agricultural and Mechanical College, Feb. 28, 1878 and opened its doors to students on Oct. 6, 1880 with an initial enrollment of 350 students. It was made coeducational in 1930, receiving its present name two years later. A graduate school was added in 1936. In 1947 new buildings were added to take care of the expanding student body, funds allocated for future building and repairs, and, a year later, plans and funds acquired for a new library building. Yearly enrollment averages about 3,000 students.

MISSISSIPPIAN. See **CARBONIFEROUS**.

MISSOLONGHI, mī-sō-lōng'gī, or **ME-SOLONGION**, mā-sō-lōng'gyōn, city, Greece, capital of Acarnania nome, on the marshy site on the north side of the Gulf of Patras, 24 miles west of Návaktos (Lepanto) and the seat of an archbishopric. Missolonghi is the most important strategical point of western Greece and is famous for the sieges it has undergone. In 1804 it came under the rule of Ali Pasha of Janina. In the Greek revolt against the Turkish conquerors in 1821 it was brilliantly defended by 400 men against a Turkish army of 14,000 for two months; when reinforced, they again for over a year resisted the Turks, who raised the siege Jan. 6, 1823. The town was hastily fortified, and from September to December 1823 was again besieged by the Turks, who were defeated by a small Greek force under Marco Bozzaris (Marko Botzaris), but with the loss of their patriotic general. In 1825-1826 it stood a long siege by the Turks. A body of its defenders cut their way through the Turkish force and escaped; the remainder determined to sell their lives as dearly as possible, and when the Turks forced their way in, the powder magazine was exploded, thus overwhelming besiegers and besieged in one common catastrophe. Lord Byron, who went to Missolonghi Jan. 5, 1824 to aid the Greeks, died there April 19, 1824; his heart was interred in the Church of St. Spyridion, and a monument erected by the Greeks in his honor. Here also is the tomb of Bozzaris. Pop. (1940) 10,565.

MISSON, mī-sōn'. **François Maximilien** French traveler and author: b. Lyon, about 1650 d. London, England, Jan. 12, 1722. He was councillor in the Parlement of Paris, but at the revocation of the Edict of Nantes, as a Protestant, fled to England. There, in 1685, he became tutor to Charles Butler, afterward earl of Arrar whom he accompanied on his travels. In 1699 he published *Nouveau Voyage d'Italie*, in which his comments on the customs of the Roman Catholic Church led to a celebrated controversy with Father Freschot. In 1698 he published volume of *Mémoires et Observations*, which constitutes a humorous descriptive dictionary of London life in Queen Anne's reign. His other chief work is *Théâtre sacré des Cévennes* (1707).

MISSOULA, mī-zōō'lā, city, Montana, and Missoula County seat; altitude 3,223 feet; on the Pacific slope of the Rocky Mountains; and the Clark Fork of the Columbia River (locally called the Missoula); 120 miles northwest of Butte; served by the Northern Pacific; and Chicago, Milwaukee, St. Paul and Pacific railroads. The city is built on both banks of the river at the mouth of Hell Gate Canyon, and is the marketing center for four fertile valleys: Flathead, Bitterroot, Blackfoot and Missoula. Major industries are flour milling and sugar refining. There are also lumber mills, a brewery, meat packing plant, and several creameries. Gold, lead and copper are mined nearby. It is the seat of Montana State University and headquarters of the Lolo National Forest. First settled in 1860, it was called Missoula Mills. Fort Missoula, southwest of the city, was established in 1877. The city was incorporated in 1885. Pop. (1940) 18,449; (1950) 22,485.

MISSOURI, mī-zōōr'i, one of the West North Central states of the United States, is bounded on the north by Iowa, on the east by Illinois, Kentucky, and Tennessee, on the south by Arkansas, and on the west by Nebraska, Kansas, and Oklahoma. The name Missouri is of Indian origin and probably means "The people of the big canoe."

State flag

Land Area	69,226 square miles
Water Area	448 square miles
Total Area	69,674 square miles
Latitude	36° to 40° 35' N.
Longitude (approx.)	89° 6' to 95° 42' W.
Altitude	230 to 1,772 feet
Population (1940)	3,784,664
Population (1950)	3,954,653
Capital city—Jefferson City; Pop. (1950)	25,099
Admitted as a state	Aug. 10, 1821
Bird	Bluebird, approved March 30, 1927
Flower	Hawthorn, approved March 16, 1923
Motto	Salus Populi Suprema Lex Esto (Let the welfare of the people be the supreme law)
Nickname	The "Show Me" state
Song	The Missouri Waltz
Tree	No official tree

State seal

Physical Characteristics.—*Topography.*—For a mid-continental state, Missouri has an unusually varied topography. Most of the area north of the Missouri River, and a triangle south of it, from Boonville to Barton County, comprise the prairie or plains divisions, the part north of the river being glaciated. These are areas of gentle rolling country, rougher along the streams. The Ozark dome or uplift runs nearly southwesterly from near St. Louis to the southwestern corner. The crest of the Ozarks is relatively level, but the flanks are deeply eroded into ridges and narrow stream valleys, with a broad band of mingled topography between it and the plains area. The highest mountain peak (1,772 feet) is the Taum Sauk in Iron County. The extreme southeastern corner or "bootheel" is alluvial and largely swampy until drained in the last 30 years.

Climate.—The average annual temperature for the entire state is about 55° F., ranging from a January average of 31° F. to a July average of 77.5° F. The variations are considerable and often abrupt, but seldom fall below —20° or rise much over 100° F. The frost free period averages from mid-April to mid-October. The average annual precipitation is about 40 inches, with a maximum in May and June, the most important growing season.

Rivers and Lakes.—The Mississippi River is the eastern boundary of the state and the Missouri, the northwestern, the latter flowing across the state to the Mississippi. The tributaries of the Mississippi north of the Missouri are relatively small—the Salt River is the largest—but to the south the Meramec, the St. Francis, the Current, and the Black are much longer, and with the White in the extreme southwest throw the eastern and southern Ozarks into the Mississippi watershed. Into the Missouri from the south flow the Gasconade from the northern Ozarks, and the Osage, draining both western Ozarks and southern plains; from the north the largest tributaries are the Chariton, Grand, and Platte. Lake Taneycomo and the Lake of the Ozarks, one of the largest artificial lakes in the United States, are created by private waterpower dams at Powersite (near Forsyth) and at Bag-nell, on the White River and the Osage.

Political Divisions.—*Cities.*—The chief cities and trading centers are St. Louis (pop. 856,796, ranking 8th nationally) and Kansas City (pop. 456,622) with St. Joseph (78,588) and Springfield (66,731) of secondary importance. These cities are included as centers of large metropolitan areas. The annual St. Louis fur market is the largest in the world; Kansas City is one of the largest primary receiving points for wheat. For population of other cities, see back of state map.

Counties.—Politically, Missouri is divided into 114 counties and the City of St. Louis.

County	County Seat	County	County Seat
Adair	Kirksville	Callaway	Fulton
Andrew	Savannah	Camden	Camden

The People.—Origins and Racial Groups.—

Up to the Civil War, Kentucky and Tennessee, with the back country of Virginia and the Carolinas, furnished much the greater part of native born immigrants, although St. Louis was always a cosmopolitan city and the north central region was receiving many immigrants from Iowa. Since the Civil War the origin of immigration has shifted more and more to Ohio, Indiana, and particularly Illinois and Kansas, and the native stock is a mingling of the northern and southern streams of western migration. In 1940, 73.2 per cent of the total population was born in Missouri.

By 1860 about 15 per cent of the population was foreign born, more than a half of these being Germans, and more than a quarter Irish. More than half of both groups were in St. Louis, although the Germans were numerous in the lower Missouri River counties and in the Osage and Gasconade valleys. The Scandinavian, Slav, and South European immigrants did not come to Missouri in considerable numbers. In 1940, 3 per cent of the population was foreign born, of which nearly one half was from Germany and Central Europe, and nearly seven tenths lived in Kansas City and St. Louis; another 9.7 per cent was of foreign or mixed parentage. The Negro population in 1940, 6.5 per cent of the total, were in the plains area accessible to the great rivers, the ante-bellum slave holding area, and particularly in Kansas City and St. Louis, which included over three fifths.

The earlier period of settlement was over by 1900; the decennial increase in population since then has varied from 3.45 to 6.6 per cent, with

a steady increase in urban population. There was an absolute decline in numbers of rural population in 1910, 1920, and 1930, with a very slight increase in 1940, due to the depression years. According to the 1950 census, Missouri had 2,432,715 persons (61.5 per cent) living in urban territory and 1,521,938 (38.5 per cent) living in rural areas.

Famous Men and Women.—In political leadership may be mentioned Thomas Hart Benton (1782–1858), political leader, born in North Carolina, who represented Missouri in the United States Senate for 30 years; Francis Preston Blair (1821–1875), statesman, born in Kentucky, but lived in St. Louis, practicing law there. He organized the Free Soil Party, opposed slavery, and supported the Union during the Civil War. Missouri placed his statue in the United States Capitol. Richard Parks Bland (1835–1899), lawyer, born in Kentucky, was United States representative from Missouri for 24 years.

was leader of the free silver bloc and coauthor of the Bland-Allison Act remonetizing silver. Champ (James Beauchamp) Clark (1850–1921) born in Kentucky, was United States representative from Missouri for many years and speaker of the House for eight years; and Harry S. Truman (1884–), born in Lamar, Mo., who became president of the United States in 1945.

In the military field, Missouri is represented by two citizens of outstanding importance, John Joseph Pershing (1860–1948), born in Limon County, Mo., who became full general and commanded the American Expeditionary Force in World War I, and chief of staff in 1921; and Omar Nelson Bradley (1893–), born in Clark Mo., who became chief of staff, United States Army, in 1948.

In science, Missouri is represented by William Pope McArthur (1814–1850), born in Ste. Genevieve, Mo., a naval officer and hydrographer who was the first surveyor of the Pacific Coast. George Washington Carver (c.1864–1943), born near Diamond, Mo., an agricultural chemist known especially for his research on the industrial use of the peanut; and Harlow Shapley (1885–), astronomer, born in Nashville, Mo. director of Harvard College Observatory since 1921.

Literature and the arts have been favored by several very well known natives of Missouri such as Samuel Langhorne Clemens (Mark Twain, 1835–1910), humorist and author, born in Florida, Mo., and lived in Hannibal; Eugene Field (1850–1895), poet and journalist, born in St. Louis; Rupert Hughes (1872–), author, born in Lancaster, Mo., prolific writer of both fiction and plays; Sara Teasdale (1884–1933) poet, born in St. Louis; Zoë Akins (1886–) poet and playwright, born in Humansville, Mo. winner of the Pulitzer drama prize for 1934; Augustus Thomas (1857–1934), playwright, born in St. Louis; James Carroll Beckwith (1852–1917), portrait painter, born in Hannibal, Mo.; Gladys Swarthout (1904–), soprano, born in Deepwater, Mo.; Helen Traub (1903–), opera and concert singer, born in St. Louis, Mo.; and Thomas Hart Benton (1889–), artist, born in Neosho, Mo., painter of many famous murals.

Others of note are Susan Elizabeth Blow (1843–1916), educator, born in St. Louis, who opened in St. Louis the first public kindergarten in the United States (1873); and Bernarr Mac

Natural Resources.—Fauna.—Missouri did not realize until 1874 that its early stock of wild life was fast disappearing. The first conservation law (1874) provided for a closed season on deer and game birds. In 1905, the Valmsley Law established closed seasons, a system of licenses, and a state appropriation. In 1936 a conservation commission was provided. A number of animals, such as rabbits, fox, squirrel, opossum, skunk, muskrat, and raccoon are common. Mexican quail and ring-necked pheasant have been introduced in the state. Native to the state are the bobwhite, mourning dove, bluebird, bullfinch, cardinal, woodpecker, and many other species of birds. Fish have decreased, but such game fish as bass, crappie, brook trout, shad, perch, crayfish, and carp are abundant.

Flora.—The Ozark region has the most varied flora in the state. Red or black oak, chittamwood, witch hazel, and hawthorn are common. In the northern exposures grow nettle tree, yellowwood, sugar maple, butternut, and hydrangea. On the southern and western exposures are found junipers, smoke tree, and soapberry. In the open slopes, aside from the juniper tree, are found such brilliantly blooming shrubs as pasture rose, acacia, and buckbush. Due to Missouri's varied climate and soil conditions, practically every kind of flower and tree is found there.

Minerals.—The variety of mineral resources is the sharpest difference between Missouri and the neighboring states. The lead area in the southeast, chiefly in the St. Francis Valley, at one time led the world in production and always leads in the United States. The extreme southwest is in the tri-state zinc area, which also leads nationally, and the limited iron deposits have been worked more than 100 years. Missouri produces over 40 per cent of the national output of bauxite and contains the only national deposit of any importance of cobalt and nickel. Coal is widely distributed throughout the plains areas, is mined locally, and, especially in the north central part, on a general commercial scale. The beds are thin but constitute an enormous reserve. Brick and tile clays are widely distributed, Missouri standing second in the production of fire clay refractories. Granite, to a very limited degree, and limestone, throughout the state, furnish excellent building materials. But the boring for oil and gas have given very disappointing results.

Forests.—Originally about 60 per cent of Missouri was forested, in the plains, especially along the rivers, but completely in the Ozarks. The most valuable growth was a block of shortleaf pine in the southeast Ozarks; elsewhere different varieties of oak are the prevailing growth. The federal government has established two national forests, the Mark Twain in the central Ozarks, and the Clark in the eastern, with an eventual loss area of 3,321,513 acres.

Soils.—In natural resources Missouri to an unusual degree is a self-sufficing area. The soils of the northern plain, glacial and loessal in origin, are first class; those of the southern plain are only slightly inferior; the belt of loess soil, the best in the state, is along the upper Missouri, 10 miles wide at Boonville and 50 in the northwest corner. The soils in the Ozark border vary

greatly, while in the Ozarks proper they are generally thinner and often marginal or submarginal for general farming.

Waterpower.—While there is abundant potential waterpower in the Ozarks, this has been developed only at Bagnell and Powersite, although other projects are planned at various authorized or proposed flood control dams.

Parks, Memorials, Refuges, and other Points of Interest.—**Parks.**—Of the more than 20 state parks, ranging in size from 16,500 acres (Lake of the Ozarks) to 34 acres (Arrow Rock State Park), 9 are in the Ozarks; several of these include big springs, and most of them are in good fishing areas, amid very attractive scenery. Three are of historical interest, the birthplaces of Mark Twain (Florida) and of Gen. John J. Pershing (Laclede), and Arrow Rock Tavern, the meeting place of men significant in the early history of the West. Mention should be made also of the private recreational centers on Lake Taneycomo and especially around the Lake of the Ozarks.

Memorials.—The Jefferson National Expansion Memorial in St. Louis is a park developed along the river front through the razing of old buildings and the improvement of the site at a cost of several million dollars. It contains various landmarks of the city, including the Old Rock House built in 1818 for the use of the Missouri Fur Company, the old Court House, and the old Cathedral of Saint Louis. There are many other memorials scattered throughout the state commemorating historic events or honoring men who served their state.

Wildlife Refuges.—There are nearly 50 wildlife refuges, public and private, of which 11 are federal, including 2 for migratory water fowl; 20 are in state parks; and 10 under the control of the bipartisan state conservation commission, which has done excellent work in restocking the rivers and game areas, with emphasis on deer and wild turkeys.

Other Points of Interest.—Hannibal, the home of Mark Twain, is full of interest to anyone who enjoys reading about Huckleberry Finn or Tom Sawyer. Here are the scenes of their life of adventure—Cardiff Hill, Tom Sawyer's fence, and the Clemens home.

St. Louis, aside from its many points of historical interest, has many beautiful modern sights to offer. Near the Union Station stands Carl Milles' fountain *The Meeting of the Waters*. The 14 bronze figures of the group symbolize the meeting of the Missouri and Mississippi rivers. The Missouri River is represented as a woman, leaning forward to greet a young man, who personifies the Mississippi River. These figures are surrounded by three tritons, a waterman with two sharks, a waterwoman hauling two urchins along, leaping fish, and boys carrying fish. On Government Drive is the Polychrome Electric Fountain, a terraced limestone formation, illuminated by colored lights at night. Nearby is the Jewel Box, a steel and glass conservatory, facing reflecting lily pools. Here may be seen a display of the choicest flowers and plants from the surrounding gardens and greenhouses. The St. Louis Zoological Garden is famous for its large collections of animals and birds and many rare specimens. The Missouri Botanical Garden contains more than 12,000 species of trees and plants and is nationally known for its flower shows.

The School of the Ozarks, near Hollister, is supported by men interested in the youth of the hills. Each year about 250 boys and girls earn a high school education by work on the school farm, dairy, cannery, or print shop. Their museum has a fine collection of birds and butterflies as well as antiques common to the hill country.

Production and Manufactures.—Agriculture.—In the field of production, Missouri, despite the increase in urban population, remains basically an agricultural state, with its prosperity depending on farm products and their processing for food. With two important exceptions the more valuable field crops are cereals, hay and forage, and pastures, all for the feeding of meat animals, poultry, and horses and mules. Winter wheat is an important rotation crop, and cotton in the "bootheel" is perhaps the leading cash crop. Truck farming and dairying to feed the growing cities and towns make substantial contributions to the total value of farm products, but neither canning nor the production of cheese and butter for export are of great importance.

Animal Industries.—Except for wheat and cotton, at least 85 per cent of the field crops were processed on the farms by feeding to farm animals—and much of the wheat came back to the farms in cattle and poultry feeds. That is, the greater part of the cash returns to Missouri farmers came from the sales of farm animals and animal products. The cattle were largely bred to the southward and bought as feeders. Horses and mules have declined in relative importance, but poultry has steadily advanced. Aided by the experiment station and the county agent organization at the state university, the Missouri farmer has shown marked advances in the use of hybrid corn seed, the growing of soybeans for forage and oil, and especially in the state-wide adoption of Korean lespedeza for forage, pasture, and seed. Missouri stands near the top in the movement for soil conservation, and the Rural Electrification Administration brings electricity to over 100,000 farms.

Forest Products.—The day of lumbering on any considerable scale is long past in Missouri, but there remains much small scale production, largely for local use. Posts, railroad ties, staves, and boxing are probably more important than finished lumber.

Minerals.—The total value of mineral production in 1944 was \$72,369,000, giving Missouri a rank of 23d in the nation. Missouri was first in lead and second in barite in 1947. Other important mineral products were clay, coal, zinc, portland cement, brick and tile, and limestone.

Manufactures.—In 1939, the last normal year preceding World War II, Missouri produced manufactured goods to the total value of \$1,388,056,267 and ranked 26th in the nation. But large scale manufacturing was confined almost entirely to the two largest cities and their industrial areas. The city of St. Louis alone produced more than half the total; the St. Louis and Kansas City industrial areas in Missouri (St. Louis city and county; Kansas City, Clay and Jackson counties) produced nearly 80 per cent. The remaining 20 per cent represents production for local consumption, such as food products of all sorts, grist mill products, newspapers and printing, and industries determined by local raw materials, such as portland cement at Hannibal and Cape Girardeau, fire brick and tile at Mexico,

and, most important, meat packing at St. Joseph. For the entire state in value of product, meat and poultry packing, and footwear and boot and shoe manufacturing stood at the top, followed by flour and grist mill products, drugs and chemicals, ready to wear clothing, and malt liquors.

Transportation and Communications.—Before the Civil War, when the rivers were the chief means of travel and trade, and the steamer traffic at its height, St. Louis, on the Mississippi, not far from the mouths of the Missouri and the Ohio, occupied a strategic position from which she largely dominated both the export trade and the distribution of eastern products in the upper valley, and profited from the rapidly growing trade to the Far West. Although with superior trunk line railroad connections with the East and the development of the lakes traffic, Chicago after 1870 supplanted St. Louis as the most important trading center in the upper valley, St. Louis has remained the important center for the lower Ohio and Mississippi Valley trade. With the coming of the railroads, Kansas City has become the exporting and jobbing area for the adjacent prairie and great plains areas and much of the Southwest and Far West. Both cities have adequate trunk line connections with the East, Chicago, and their trade areas. Within the state there were, in 1948, 6,876 miles of railroad trackage, but chiefly in an east and west direction.

The state highway system was started rather late, in 1921, but has been carried through to excellent results. In 1948 the system comprised 17,279 miles of improved roads. Special emphasis has been on gravel "farm to market" roads. The total cost of construction has been met by two bond issues, federal aid, and the gasoline tax and motor license fees. The earmarking of the last two items by constitutional amendment to the highway commission has freed it from undue pressure from local interests and politicians. St. Louis and Kansas City have airports accommodating the largest commercial planes. The telegraph and telephone services are reasonably adequate. Neither Kansas City nor St. Louis have as yet (1948) built subways.

Economic and Financial Factors.—Banking.—As of June 30, 1948, there were 79 national banks with total assets of \$1,650,316,000 and total deposits of \$1,554,354,000. The Boatmen's Bank of St. Louis, the oldest national bank west of the Mississippi, celebrated its centennial in 1947. There were 520 state banks in 1947, with total assets of \$2,684,956,830, and total deposits of \$2,510,745,024.

Finance.—The figures for the year ending June 30, 1948, are as follows:

Balance in state treasury, beginning of fiscal year, 1947-1948	\$109,912,116.80
Receipts, all sources 1947-1948	198,556,696.00
Total	\$308,468,812.80
Disbursements, 1947-1948	185,831,452.75
Balance, beginning of fiscal year 1948-1949	\$122,587,360.05
State indebtedness on June 30, 1948	\$ 49,000,000.00

Taxation.—The state (1948) has a sales amounting to 2 per cent, and an income as well as taxes on liquor, gasoline, vehicle licenses, and miscellaneous items.

Government.—Executive.—The most in

ant recent event in the field of government in Missouri was the adoption of a new and much improved constitution in 1945. The original constitution of 1820 remained the fundamental law until 1865, when the Radicals drafted a new and, in many respects, a more modern frame of government, but including very stringent oaths of loyalty; in 1875 a new constitution was adopted which remained in force until 1945. This 1875 constitution was extremely conservative, reflecting the panic of 1873, and heavy state and local debts, and reaction against the Radical rule of the 1860's. The powers of the legislature were strictly limited, particularly in the field of taxation, and the whole frame of state and local government very inflexible. By the turn of the century these limitations rendered it less and less satisfactory in a period of rapid economic changes, so that numerous proposed amendments were voted on at nearly every election. In 1922 a constitutional convention drafted what was practically a new constitution in the form of 21 amendments; only 6, and these of secondary importance, were adopted. In all, between 1878 and 1940, 167 constitutional amendments were proposed and 56 were adopted; there were many petitions and a large part of both were in the nature of statutory law rather than changes in the frame of government. But finally the present constitution was adopted in 1945. The legislature by 1947 had implemented by legislation the basic changes, but the details and the reconciliation of the older statutes to the new order were still in process.

The new constitution, framed after long public hearings, is by no means a radical one. The convention's objectives were clearly a frame of government of increased efficiency and sufficient flexibility to meet modern problems, rather than a radical change or experimentation. The governor is still elected for four years and ineligible for reelection; the secretary of state, the auditor, the treasurer, and the attorney general are also still elective for four year terms. But the thorough reorganization of the executive machinery was probably the most important service of the convention. The auditor's functions, which had become numerous and diverse, were reduced to planning state and local systems of counting and postauditing state and local agencies of government. A new department of revenue was created, which has charge of all collections of taxes, fees, and licenses, formerly read over ten departments and commissions; the preparation of the budget; the preauditing of claims. The other executive departments, education, highways, agriculture, and conservation were formerly, except the department of education, commissions; the legislature was required to create a department of public health and welfare, a consolidation of several previous commissions. The heads of these departments are appointive by the governor, except in education, where a bipartisan appointive board appoints the commissioner. And the governor was empowered to assign each of some 70 independent minor commissions and bureaus to the executive department to which the work of each is related. By retaining the popular election of the heads of the older departments (except education), the convention went only part way with the trend toward greater powers and responsibilities to the governor, but was vitally interested in more efficient machinery of administration.

GOVERNORS

TERRITORIAL PERIOD

William C. C. Claiborne	Acting Governor General and Intendant of Louisiana	1803-1804
Amos Stoddard	First Civil Commandant of Upper Louisiana	1804
William Henry Harrison (Gov. of Indiana Ter.)	Governor, District of Louisiana	1804-1805
James Wilkinson	Governor, Territory of Louisiana	1805-1807

(1) Died in office. (2) Resigned. (3) Expelled by convention. (4) Appointed by convention. (5) Acting.

Legislature.—The state legislative body, called the General Assembly, consists of a Senate with 34 members, elected for four years, and a House of Representatives, with 154 members, elected for two years. The General Assembly meets biennially in odd years. It convenes on Wednesday after the first Monday in January. The length of the regular session is not specified.

In the legislative department the convention showed its characteristic shrewd analysis of public opinion by resisting strong pressure for a unicameral legislature. The older bicameral form was retained, with only minor changes such as the revision of senatorial districts after each census by an appointive bipartisan commission, and the requirement of a public record of all votes in committee. The powers of the legislature were somewhat extended, but particularly the older paralyzing requirements of absolute uniformity in legislation were largely relaxed. For example, the older requirement of

the same tax rate for all classes of property meant the near-confiscation of the income from intangibles, and as a result, stocks, bonds, and mortgages were, for the most part, not assessed or taxed. In the new constitution taxable property is divided into three classes, real estate, tangible personal property, and intangible personal property, and the legislature authorized the imposition of different rates in different classes.

Local Government.—The advance in flexibility is particularly apparent in local government. The right of municipal home rule, of a city to draft its own charter, formerly enjoyed only by St. Louis and Kansas City, was extended to all municipalities of over 10,000 inhabitants, and to counties of over 85,000. The legislature may provide alternative forms of county government, from which the county may choose. Provision was made for the voluntary consolidation of counties, and the cooperation of county groups for such purposes as airports, hospitals, and roads. The initiative and referendum, adopted in 1908, and very sparingly used, was retained in the new constitution.

Courts.—In the judicial department the old structure was retained, consisting of a supreme court of 7 judges, of 3 district courts of appeals, 38 circuit courts, and a probate judge for each county. The old justice of the peace court was superseded by the magistrate's court; both probate judges and magistrates must be legally trained. The judges of the supreme court and the appellate courts serve for 12 years, of the circuit courts for 6 years, and probate judges and magistrates for 4 years. For the selection of supreme court judges, appellate court judges, and judges of St. Louis City and Jackson County the nonpartisan court plan adopted in 1940 was retained. In case of a vacancy the governor makes the appointment from 3 nominations presented by a nonpartisan commission of representatives of the bar and appointed laymen. After a year's service the name of the appointee is submitted to a popular vote; at the close of his term he may file for reelection without any party endorsement. The other judges remain elective. The supreme court was given power to make rules of practice and procedure for all courts, to transfer judges temporarily from one court to another, and more extensive power to review opinions of the appellate courts.

Public Welfare.—The penal institutions of the state are the penitentiary at Jefferson City and the Alcoa Farms Intermediate Reformatory for Young Men. The older reform schools, the Missouri Training School for Boys at Boonville, the State Industrial Home for Girls at Chillicothe, the Industrial Home for Negro Girls at Tipton, were declared by the new constitution to be educational rather than penal, and placed under a separate bipartisan board. There are four state hospitals for the insane, located at Fulton (1847, the oldest west of the Mississippi), St. Joseph, Nevada, and Farmington; there are two schools for the feeble-minded and epileptic, at Marshall and Carrollton; there is a tuberculosis sanatorium at Mount Vernon, a trachoma hospital at Rolla, and a state cancer hospital at Columbia. The new constitution established the merit system (which the legislature may extend to all state employees) for all penal and eleemosynary institutions. The state established pensions for the blind on an effective basis in

1921, and free medical care for crippled children in 1927.

Social Legislation.—Up to the 1930's, relief and social security were still largely left to the counties and cities, and state legislation dealt with broadening the powers of local governments. The economic collapse after 1929, the availability of federal funds under New Deal legislation, and greatly increased state revenue from the sales tax, all led to a great broadening of state activities in relief and social security. The state social security commission, established in 1937, was given charge of old age assistance, aid to dependent children, and the child welfare programs, all jointly supported by state and federal governments; in the same year unemployment compensation was assigned to a special commission. The much older state board of health had had too limited appropriations and personnel to perform effectively its widespread functions; its most important activities had been the licensing of doctors and the recording of vital statistics. The consolidation of these various agencies in the new department of public health and welfare should lead to greater efficiency and more adequate programs and support.

Educational System.—**Universities and Colleges.**—The University of Missouri (q.v.) at Columbia and Rolla, chartered in 1839 and opened in 1841, is the oldest state university west of the Mississippi. Other schools are Central College (Methodist), Fayette; College of St. Teresa (private), Kansas City; Conception Seminary (Catholic), Conception; Culver-Stockton College (Disciples of Christ Church), Canton; Drury College (Congregational), Springfield; Lincoln University (state), Jefferson City and St. Louis; Lindenwood College for Women (Presbyterian), St. Charles; Missouri Valley College (Presbyterian), Marshall; Park College (Presbyterian), Parkville; Rockhurst College (Catholic), Kansas City; St. Louis University (Catholic), St. Louis; Tarkio College (Presbyterian), Tarkio; University of Kansas City (private), Kansas City; Washington University (private), St. Louis; Webster College (Catholic), Webster Groves; Westminster College (Presbyterian), Fulton; and William Jewell College (Baptist), Liberty.

There are 10 professional schools covering the subjects of theology, music, osteopathy, and pharmacy. Among the 23 junior colleges, Christian and Stephens, both at Columbia, are the most important private-junior colleges for women.

In the professional training of teachers, the first basic program was begun by the state university in 1867, and by the establishment of normal schools at Kirksville and Warrensburg in 1870, at Cape Girardeau in 1873, and at Springfield and Maryville in 1905. In 1919 all normal schools were officially styled state teachers colleges. In 1945 the colleges at Cape Girardeau, Springfield, and Warrensburg became state colleges. The university established a school of education in 1905. Teacher training courses are given in all the universities and colleges, some of the junior colleges, and 13 high schools. Since the turn of the century the control of the state department has steadily grown. Since 1913 it has controlled the certification of teachers, raising the requirements, drafting the questions, and grading the answers in the local examinations. The inspection, classi-

ication, and approval of individual schools, begun for high schools by the university, was established under the state department in 1903, but insufficient funds at its disposal compelled the university to continue its inspections; since 1924 the latter has inspected only private and denominational secondary schools, and all that are members of or candidates for admission to the North Central Association of Colleges and Secondary Schools. Other important pieces of legislation were the compulsory attendance acts of 1905, 1908, and 1919, the consolidation of schools acts of 1901 and 1913, and the pensions for retired teachers, effective in 1946.

The state maintains a school for the blind at St. Louis and for the deaf at Fulton, both with free tuition, board, and lodging. Both the constitutions of 1875 and 1945 require the segregation by race of all students in state institutions, but the Negro public schools of Missouri have probably been more nearly the equal of the white than in any other state separating the races. The new constitution forbids the allocation of state funds to any school district permitting differences in salary to teachers of equal training or experience because of color. Lincoln University (1870) at Jefferson City has been devoted primarily to the training of Negro teachers. Formerly the state paid the tuition in out-state schools of Negro graduate and professional students, but under recent court decisions it is now forced to provide such training at home. There are junior colleges for Negroes at St. Louis and at Kansas City.

Public Schools.—In the administration of public schools the new constitution marked a noteworthy advance by substituting for the older inactive board of education of ex officio members and a state superintendent elected by popular vote, a bipartisan board of 8 members, appointed for 8 years by the governor, who appoint the commissioner of education for an indefinite term. The obvious purposes were to eliminate politics and ensure continuity of policy and development under a trained educator.

The first law creating a system of public schools was passed in 1839, but was directive and ineffective; the real beginning was under the law of 1853 which created a state superintendent and set aside 25 per cent of the general revenue for the public schools. But in the troubled decade of the 1860's, the system collapsed over a large part of the state and the progressive legislation under the Radical regime proved in advance of public opinion and financial resources. The conservative constitution of 1875 retained the 25 per cent allotment but its stringent limitations on the power of taxing and borrowing proved a serious handicap. The 25 per cent requirement was retained in the new constitution; in actual practice the allotment was raised to 33½ per cent in 1887, where it has since remained.

All public schools follow courses of study prescribed by the state department. Consolidations, better roads, and state appropriations for buses have steadily reduced the number of rural schools. The percentage of illiteracy in Missouri in 1930 was 2.3 per cent.

Libraries.—There were in 1947, 187 public libraries in Missouri. The new constitution (1945) authorizes state aid to municipal libraries. There are quite a few libraries with interesting collections such as that on consumer education at Stephens College; on brewing and corn products

at the Anheuser-Busch library in St. Louis; on political science at the Governmental Research Institute in St. Louis; on botany, which includes the Sturtevant collection dating back to 1474, at the Missouri Botanical Garden Library in St. Louis; on art and music in the St. Louis Public Library; on Missouri and Western history in the State Historical Society at Columbia, the Missouri Historical Society at St. Louis, the University of Missouri Library at Columbia, and the Western Historical Manuscripts collection at Columbia.

History.—Missouri, with her role as the Gateway to the West, for the fur traders and Forty-niners, and the actual settlers of Oregon, California, and Texas, and her tragic division of opinions as a border slave state in the decade of the 1860's, has an unusually colorful history. After Marquette and Jolliet (1673) and LaSalle (1682) passed by Missouri on the Mississippi, the beginning of white occupation dates from the establishment of French Canadian villages just across the Mississippi around 1700. The young men hunted up the Missouri and began lead mining in the St. Francis Valley. The first permanent settlement (about 1735) was at Ste. Genevieve, at the crossing to the lead country. After Illinois and the eastern half of the great valley were ceded by France to England in 1763, many French Canadians moved across the river; St. Louis, founded in the winter of 1763-1764 as a fur trading post, became a prosperous little town. Under the Spanish, to whom France had ceded the western great valley, St. Charles and New Madrid began. The French settled in village communities, with a simple and attractive society and absolute government; the Spanish regime brought little change. Beyond the names of streams along the Mississippi and lower Missouri, and family names in St. Louis and Ste. Genevieve, there is little trace of the French in Missouri today.

Already, before the Louisiana Purchase of 1803, and the raising of the American flag in St. Louis in 1804, the American log cabin pioneers were in the majority. Until 1815, the growth of population was slow, due to the uncertainty of Spanish land titles, Indian troubles in the War of 1812, and the abundance of empty land to the eastward. The pioneers poured in after 1815, especially into the Missouri Valley west of where the bluffs break down from Boonville westward, and along the upper Mississippi. By 1820 the population of Missouri Territory, which had been granted an elective legislature in 1812 and 1816, was over 66,000; St. Louis was a town of some 4,000, with a newspaper and a fire department; Ste. Genevieve, still exclusively French, had perhaps 2,000; Franklin, opposite the present Boonville, with 1,000, a newspaper and a jockey club, was a bit of blue grass Kentucky in the wilderness. Already Missouri was looking to the Far West. The famous expedition of Lewis and Clark (1804-1806), from St. Louis to the mouth of the Columbia River and back, revealed the abundance of beaver in the Rocky Mountains and led to an attempt to exploit it, unsuccessful because of Indian troubles. Zebulon M. Pike's expedition up the Arkansas (1806) led to an attempt, also unsuccessful, to open trade with Santa Fe.

The admission of Missouri to statehood, for which she applied in 1818, precipitated the first clean-cut clash between Northern and Southern

interests, when the House of Representatives at Washington proposed the exclusion of slavery from the new state. The result was the well-known Missouri Compromise of 1820, by which Missouri was admitted without restriction, but slavery was prohibited elsewhere in the Louisiana Purchase north of 36° 30', the southern boundary of the state. Due to a secondary dispute over free Negroes, Missouri was actually admitted by presidential proclamation Aug. 10, 1821. Meanwhile, in 1820, Missouri had drawn up a constitution, and elected and organized a state government, 10 months before her actual admission.

The most important activity in the next three decades was the extension of settled area and the conquest of the wilderness, involving strenuous effort and often hardship, but, as there were no Indians to contend with, devoid of striking incidents. The spread of settlement was chiefly in the plains areas; the dates of occupation and the emergence of more mature economic and social conditions in the different areas depended on the relative fertility of the soil, but more on accessibility to river transportation. A considerable number of blue grass Kentuckians, cashing in on increased land values, were coming to Missouri with capital and slaves, and became the ruling class along the Missouri from Callaway and Cooper countries westward and along the upper Mississippi. A similar society developed in the Platte Purchase, the northwestern corner (the original western boundary was a straight line) added to the state in 1837. Steamboats—the first reached St. Louis in 1817 and Franklin in 1819—were supplementing the rafts and flat boats, and stage lines of a sort were running from St. Louis to the western border. Settlers were taking up the narrow fertile valleys in the Ozarks, but the considerable settlement of the rougher country there belongs to the 1850's. Springfield, in an island of desirable land, began about 1830; the other towns of importance were on or near the two rivers.

The upper Missouri fur trade and the Santa Fe trade provided the romance and adventure. William Henry Ashley, the successful pioneer in the fur trade, after disastrous failures in the present Montana, made a fortune from the area north of the Great Salt Lake. His Rocky Mountain Fur Company did not have fixed trading posts or hired hunters. The furs were gathered by the "Mountain Men" who every year brought their furs to an agreed upon rendezvous and got their supplies. These hunters covered all the northern Rockies; Jim Bridger, with a deer skin and a bit of charcoal, could draw from personal experience an acceptable map of the whole region. Jedediah Smith, with a handful of companions, struck south along the Colorado and into southern California, then north to the Columbia and back to the Salt Lake region. Ashley beaver was the prime grade on the London market. In the late 1820's the St. Louis merchants reluctantly admitted John Jacob Astor to the trade, and in the 1830's the American Fur Company, with Astor capital and St. Louis management forced out all competition. With its fixed trading posts and hired hunters, and with the killing off of the beaver and the coming of the silk hat, the romance largely disappeared after 1840. Farther south, back of Santa Fe, Kit Carson, who had run away from Franklin as a lad, was the outstanding figure. Hunter

and trader, scout and guide of government expeditions, and Indian agent, he has somewhat the same place among the "Mountain Men" that Daniel Boone has among the Ohio Valley path breakers.

The fur from the southern Rockies came out to St. Louis by the overland trade with Santa Fe. This trade was always chiefly by individual adventurers, who outfitted at the western Missouri River towns, and rendezvoused for the annual caravan in southern Kansas. They took out in their covered wagons manufactured goods, especially textiles, and brought back fur, gold and silver bullion, horses, and the ancestors of the Missouri mule. Individuals and small groups suffered severely from the Indians, who seldom attacked the caravan. The trade was profitable, often netting 50 per cent, and brought into Missouri as much as \$200,000 in bullion in one year.

The hunters and fur traders contributed little to the development of the Far West except the knowledge of the trails and mountain passes. They were followed in the 1840's by an increasing migration of Missourians to settle in Oregon and California, all before the Forty-niners. Stephen Fuller Austin, the father of Texas, had earlier managed his father's lead mining interests in Missouri, and Missourians were prominent in early Texas history. The Missourians at home were keenly interested in the annexation of Texas and the resulting Mexican War, to which they contributed Col. Alexander W. Doniphan's extraordinary expedition. A force of some 300 regular cavalry under a regular army officer, and a thousand mounted Missouri militia, went down the Santa Fe trail and occupied Santa Fe. The regulars then went on to California, and Doniphan, with his little force and no base of supplies or support, struck south to the Rio Grande and on to Chihuahua in northern Mexico. The expedition from the seacoast he expected to meet there had been countermanded, but with considerable difficulty Doniphan got his men out to the east coast and finally home by steamboat up the Mississippi.

The Mormons furnished another colorful incident. In 1831 their leader, Joseph Smith, came to Independence, declared it to be the future Zion of his church, and dedicated the temple site. After his return East, the Mormons came in increasing numbers, and friction with the "gentiles" developed until mob violence forced the Mormons to flee across the Missouri. Received with sympathy at first, they soon faced a similar situation. The legislature then created Caldwell County, well north of the river, with the tacit understanding it was to be a Mormon county. When Smith and the main body of his church came out from Ohio, the county was too small for them. Guerrilla warfare ensued, climaxing in the calling out of the state militia, and the agreement of the Mormons to withdraw to Nauvoo, Ill., their last station before the long trek to Utah. Their combination of church and state with the fear that they would thus secure local political control, and their open opposition to slavery were major causes of friction. The Mormons still own the temple site at Independence and have acquired extensive real estate holdings there.

Like all Westerners, Missourians took politics very seriously, though more interested in aggressive leaders than in abstract principles. In the inconclusive presidential election of 18

Missouri voted for Clay; the popular anger at the election by the House of Representatives of Adams over Jackson, the other Western candidate, gave Jackson a majority in every county in 1828. By 1836 the leaders had transformed his devotion to "Old Hickory" into the well organized and disciplined Democratic Party. The Whigs, strongest in the towns and in the wealthier, slaveholding river counties, reluctantly followed suit. Thomas Hart Benton, United States senator from Missouri since 1821 and administration leader in the Senate after 1829, was the dominant leader of the Democrats.

The economic and social changes of the hectic 1850's nearly transformed the state. With the gold rush came the development of the overland traffic, with St. Louis as the supply center, by steamer to St. Joseph and the growing Kansas City, and on by ox and mule teams. St. Joseph was the starting point of the famous Pony Express to California. The rapid development of the upper Mississippi Valley and the growing Southern market, with the increasing specialization in cotton, were added stimuli to trade and to St. Louis. The coming of the railroads was the outstanding change. Beside the need for better transportation within the state was the conviction of Benton and the St. Louis interests that a railroad across the state would inevitably make St. Louis the eastern terminus of the proposed transcontinental railroad. As liquid capital for construction was lacking, in 1851 the state loaned \$2,000,000 in state bonds to the proposed Pacific road to Kansas, and followed with loans on four other lines, all but the Hannibal and St. Joseph, starting from St. Louis. In the 1850's the state thus invested over \$23,000,000 and most of the roads received also federal land grants, and grants from St. Louis and the counties through which they ran. The results were disappointing. By 1860 only one, the Hannibal and St. Joseph, financed in Boston, was completed; the Pacific had reached Jefferson City, the South-west Branch stopped at Rolla, the present day Vabash at Macon. But clearly a new economic era was dawning.

In population, in 1860, Missouri topped the million mark with more than half natives of Missouri. Of the total white population, 15 per cent were born in free states, chiefly Ohio, Indiana, and Illinois; about 15 per cent were foreign born, chiefly German and Irish. More than half of these were in St. Louis and constituted more than half of its population of 190,500. That is, nearly a third of the total population and nearly two thirds of the population of St. Louis were born in free states or abroad. As people, as in economics, the earlier Southern coloring was fading out. The institution of slavery itself was rising ground; the percentage of slaves in the total population, steadily declining since 1830, had dropped to about 9 per cent in 1860. The institution was holding its own only in some 20 of the older, richer river counties, where in a few the percentage was over 25 per cent. Slaveholdings for the most part were small and the majority of slaves were household or personal servants. They were used also for growing tobacco and hemp, but even more for general farming. The typical plantation of the lower South, with the absentee landlord, hired overseer, and field gangs, was not to be found in Missouri, where the institution was essentially archaic.

The downfall of Benton and the break up of the Whig Party confused the party politics of the decade. Benton lived chiefly at Washington, had little interest in patronage or a personal machine, and by his arrogance embittered the local leaders. He very wisely opposed the immediate annexation of Texas and finally broke with President Polk and became a free lance at Washington. He was never reconciled to the growing dominance of the Southern wing in party control. When in 1849 the local leaders passed a legislative resolution criticizing his policies, he stumped the state in a vitriolic appeal to the rank and file, but failed to secure a majority in the legislature. He nearly recaptured control of the party in 1852, prevented the election of anyone as senator in 1854, and, although mortally ill, again stumped the state in 1856. A coalition of old line Whigs and Benton Democrats came within a few hundred votes of electing him governor in the special election of 1857. Benton's strong nationalism and anti-Southern views forced the victorious anti-Benton leaders generally into a close alliance with the Southern wing of the Democratic Party. In the presidential election of 1860, however, the rank and file of the party compelled them reluctantly to support Stephen A. Douglas, a Westerner and champion of local home rule on the slavery question. Douglas carried the state, with John Bell, favoring moderation and compromise, second, and with John Cabell Breckenridge and Lincoln, the extreme sectional candidates, well in the rear.

The secession of South Carolina presented Missouri and the border slave states with a most difficult choice. Except for the Southern market, her economic interests were clearly Northern and Western, her population was changing, and the nationalistic tradition of Jackson and Benton was still strong. On the other hand the Old Guard of the dominant party was strongly pro-Southern and the well-to-do ruling class in the older sections looked on Kentucky and Virginia as their original homeland, regarded the Southerners as kinsfolk, and believed Lincoln and the Republicans to be revolutionary abolitionists. No wonder most Missourians in the first months of 1861 hoped desperately for compromise and the avoidance of civil war. The convention meeting in March did not include a single advocate of immediate secession, and, defeating the attempt of the pro-Southern minority to pledge Missouri to secession if compromise failed, by a two-thirds majority pledged Missouri's support to any peaceful settlement.

But what if compromise failed? The incoming governor, Claiborne F. Jackson, had been trying in vain to induce the legislature to put the state on a war footing, avowedly to defend the state's neutrality. Even after the firing on Fort Sumter in April, and Jackson's indignant refusal to obey Lincoln's call for troops, the legislature still hesitated. When the governor established a camp of militia just outside of St. Louis, the federal commander there, Nathaniel Lyon, broke it up; on its return, his force, composed largely of Germans, fired into a civilian mob and the state was in an uproar. The governor secured his war powers and when, in June, he called for 50,000 volunteers for a state army, Lyon occupied Jefferson City, and the officials fled to the southwest. This federal interference and the unfortunate Camp Jackson affair, all of debatable necessity, certainly drove thousands of Mis-

the same tax rate for all classes of property meant the near-confiscation of the income from intangibles, and as a result, stocks, bonds, and mortgages were, for the most part, not assessed or taxed. In the new constitution taxable property is divided into three classes, real estate, tangible personal property, and intangible personal property, and the legislature authorized the imposition of different rates in different classes.

Local Government.—The advance in flexibility is particularly apparent in local government. The right of municipal home rule, of a city to draft its own charter, formerly enjoyed only by St. Louis and Kansas City, was extended to all municipalities of over 10,000 inhabitants, and to counties of over 85,000. The legislature may provide alternative forms of county government, from which the county may choose. Provision was made for the voluntary consolidation of counties, and the cooperation of county groups for such purposes as airports, hospitals, and roads. The initiative and referendum, adopted in 1908, and very sparingly used, was retained in the new constitution.

Courts.—In the judicial department the old structure was retained, consisting of a supreme court of 7 judges, of 3 district courts of appeals, 38 circuit courts, and a probate judge for each county. The old justice of the peace court was superseded by the magistrate's court; both probate judges and magistrates must be legally trained. The judges of the supreme court and the appellate courts serve for 12 years, of the circuit courts for 6 years, and probate judges and magistrates for 4 years. For the selection of supreme court judges, appellate court judges, and judges of St. Louis City and Jackson County the nonpartisan court plan adopted in 1940 was retained. In case of a vacancy the governor makes the appointment from 3 nominations presented by a nonpartisan commission of representatives of the bar and appointed laymen. After a year's service the name of the appointee is submitted to a popular vote; at the close of his term he may file for reelection without any party endorsement. The other judges remain elective. The supreme court was given power to make rules of practice and procedure for all courts, to transfer judges temporarily from one court to another, and more extensive power to review opinions of the appellate courts.

Public Welfare.—The penal institutions of the state are the penitentiary at Jefferson City and the Alcoa Farms Intermediate Reformatory for Young Men. The older reform schools, the Missouri Training School for Boys at Boonville, the State Industrial Home for Girls at Chillicothe, the Industrial Home for Negro Girls at Tipton, were declared by the new constitution to be educational rather than penal, and placed under a separate bipartisan board. There are four state hospitals for the insane, located at Fulton (1847, the oldest west of the Mississippi), St. Joseph, Nevada, and Farmington; there are two schools for the feeble-minded and epileptic, at Marshall and Carrollton; there is a tuberculosis sanatorium at Mount Vernon, a trachoma hospital at Rolla, and a state cancer hospital at Columbia. The new constitution established the merit system (which the legislature may extend to all state employees) for all penal and eleemosynary institutions. The state established pensions for the blind on an effective basis in

1921, and free medical care for crippled children in 1927.

Social Legislation.—Up to the 1930's, relief and social security were still largely left to the counties and cities, and state legislation dealt with broadening the powers of local governments. The economic collapse after 1929, the availability of federal funds under New Deal legislation, and greatly increased state revenue from the sales tax, all led to a great broadening of state activities in relief and social security. The state social security commission, established in 1937, was given charge of old age assistance, aid to dependent children, and the child welfare programs, all jointly supported by state and federal governments; in the same year unemployment compensation was assigned to a special commission. The much older state board of health had had too limited appropriations and personnel to perform effectively its widespread functions; its most important activities had been the licensing of doctors and the recording of vital statistics. The consolidation of these various agencies in the new department of public health and welfare should lead to greater efficiency and more adequate programs and support.

Educational System.—**Universities and Colleges.**—The University of Missouri (q.v.) at Columbia and Rolla, chartered in 1839 and opened in 1841, is the oldest state university west of the Mississippi. Other schools are Central College (Methodist), Fayette; College of St. Teresa (private), Kansas City; Conception Seminary (Catholic), Conception; Culver-Stockton College (Disciples of Christ Church), Canton, Drury College (Congregational), Springfield; Lincoln University (state), Jefferson City and St. Louis; Lindenwood College for Women (Presbyterian), St. Charles; Missouri Valley College (Presbyterian), Marshall; Park College (Presbyterian), Parkville; Rockhurst College (Catholic), Kansas City; St. Louis University (Catholic), St. Louis; Tarkio College (Presbyterian), Tarkio; University of Kansas City (private), Kansas City; Washington University (private), St. Louis; Webster College (Catholic), Webster Groves; Westminster College (Presbyterian), Fulton; and William Jewell College (Baptist), Liberty.

There are 10 professional schools covering the subjects of theology, music, osteopathy, and pharmacy. Among the 23 junior colleges, Christian and Stephens, both at Columbia, are the most important private junior colleges for women.

In the professional training of teachers, the first basic program was begun by the state university in 1867, and by the establishment of normal schools at Kirksville and Warrensburg in 1870, at Cape Girardeau in 1873, and at Springfield and Maryville in 1905. In 1919 all normal schools were officially styled state teachers colleges. In 1945 the colleges at Cape Girardeau, Springfield, and Warrensburg became state colleges. The university established a school of education in 1905. Teacher training courses are given in all the universities and colleges, some of the junior colleges, and 13 high schools. Since the turn of the century the control of the state department has steadily grown. Since 1913 it has controlled the certification of teachers, raising the requirements drafting the questions, and grading the answers in the local examinations. The inspection, classi-

fication, and approval of individual schools, begun for high schools by the university, was established under the state department in 1903, but insufficient funds at its disposal compelled the university to continue its inspections; since 1924 the latter has inspected only private and denominational secondary schools, and all that are members of or candidates for admission to the North Central Association of Colleges and Secondary Schools. Other important pieces of legislation were the compulsory attendance acts of 1905, 1908, and 1919, the consolidation of schools acts of 1901 and 1913, and the pensions for retired teachers, effective in 1946.

The state maintains a school for the blind at St. Louis and for the deaf at Fulton, both with free tuition, board, and lodging. Both the constitutions of 1875 and 1945 require the segregation by race of all students in state institutions, but the Negro public schools of Missouri have probably been more nearly the equal of the white than in any other state separating the races. The new constitution forbids the allocation of state funds to any school district permitting differences in salary to teachers of equal training or experience because of color. Lincoln University (1870) at Jefferson City has been devoted primarily to the training of Negro teachers. Formerly the state paid the tuition in out-state schools of Negro graduate and professional students, but under recent court decisions it is now forced to provide such training at home. There are junior colleges for Negroes at St. Louis and at Kansas City.

Public Schools.—In the administration of public schools the new constitution marked a noteworthy advance by substituting for the older inactive board of education of ex officio members and a state superintendent elected by popular vote, a bipartisan board of 8 members, appointed for 8 years by the governor, who appoint the commissioner of education for an indefinite term. The obvious purposes were to eliminate politics and ensure continuity of policy and development under a trained educator.

The first law creating a system of public schools was passed in 1839, but was directive and ineffective; the real beginning was under the law of 1853 which created a state superintendent and set aside 25 per cent of the general revenue for the public schools. But in the troubled decade of the 1860's, the system collapsed over a large part of the state and the progressive legislation under the Radical regime proved in advance of public opinion and financial resources. The conservative constitution of 1875 retained the 25 per cent allotment but its stringent limitations on the power of taxing and borrowing proved a serious handicap. The 25 per cent requirement was retained in the new constitution; in actual practice the allotment was raised to 33½ per cent in 1887, where it has since remained.

All public schools follow courses of study prescribed by the state department. Consolidations, better roads, and state appropriations for buses have steadily reduced the number of rural schools. The percentage of illiteracy in Missouri in 1930 was 2.3 per cent.

Libraries.—There were in 1947, 187 public libraries in Missouri. The new constitution (1945) authorizes state aid to municipal libraries. There are quite a few libraries with interesting collections such as that on consumer education at Stephens College; on brewing and corn products

at the Anheuser-Busch library in St. Louis; on political science at the Governmental Research Institute in St. Louis; on botany, which includes the Sturtevant collection dating back to 1474, at the Missouri Botanical Garden Library in St. Louis; on art and music in the St. Louis Public Library; on Missouri and Western history in the State Historical Society at Columbia, the Missouri Historical Society at St. Louis, the University of Missouri Library at Columbia, and the Western Historical Manuscripts collection at Columbia.

History.—Missouri, with her role as the Gateway to the West, for the fur traders and Forty-niners, and the actual settlers of Oregon, California, and Texas, and her tragic division of opinions as a border slave state in the decade of the 1860's, has an unusually colorful history. After Marquette and Jolliet (1673) and LaSalle (1682) passed by Missouri on the Mississippi, the beginning of white occupation dates from the establishment of French Canadian villages just across the Mississippi around 1700. The young men hunted up the Missouri and began lead mining in the St. Francis Valley. The first permanent settlement (about 1735) was at Ste. Genevieve, at the crossing to the lead country. After Illinois and the eastern half of the great valley were ceded by France to England in 1763, many French Canadians moved across the river; St. Louis, founded in the winter of 1763-1764 as a fur trading post, became a prosperous little town. Under the Spanish, to whom France had ceded the western great valley, St. Charles and New Madrid began. The French settled in village communities, with a simple and attractive society and absolute government; the Spanish regime brought little change. Beyond the names of streams along the Mississippi and lower Missouri, and family names in St. Louis and Ste. Genevieve, there is little trace of the French in Missouri today.

Already, before the Louisiana Purchase of 1803, and the raising of the American flag in St. Louis in 1804, the American log cabin pioneers were in the majority. Until 1815, the growth of population was slow, due to the uncertainty of Spanish land titles, Indian troubles in the War of 1812, and the abundance of empty land to the eastward. The pioneers poured in after 1815, especially into the Missouri Valley west of where the bluffs break down from Boonville westward, and along the upper Mississippi. By 1820 the population of Missouri Territory, which had been granted an elective legislature in 1812 and 1816, was over 66,000; St. Louis was a town of some 4,000, with a newspaper and a fire department; Ste. Genevieve, still exclusively French, had perhaps 2,000; Franklin, opposite the present Boonville, with 1,000, a newspaper and a jockey club, was a bit of blue grass Kentucky in the wilderness. Already Missouri was looking to the Far West. The famous expedition of Lewis and Clark (1804-1806), from St. Louis to the mouth of the Columbia River and back, revealed the abundance of beaver in the Rocky Mountains and led to an attempt to exploit it, unsuccessful because of Indian troubles. Zebulon M. Pike's expedition up the Arkansas (1806) led to an attempt, also unsuccessful, to open trade with Santa Fe.

The admission of Missouri to statehood, for which she applied in 1818, precipitated the first clean-cut clash between Northern and Southern

interests, when the House of Representatives at Washington proposed the exclusion of slavery from the new state. The result was the well-known Missouri Compromise of 1820, by which Missouri was admitted without restriction, but slavery was prohibited elsewhere in the Louisiana Purchase north of 36° 30', the southern boundary of the state. Due to a secondary dispute over free Negroes, Missouri was actually admitted by presidential proclamation Aug. 10, 1821. Meanwhile, in 1820, Missouri had drawn up a constitution, and elected and organized a state government, 10 months before her actual admission.

The most important activity in the next three decades was the extension of settled area and the conquest of the wilderness, involving strenuous effort and often hardship, but, as there were no Indians to contend with, devoid of striking incidents. The spread of settlement was chiefly in the plains areas; the dates of occupation and the emergence of more mature economic and social conditions in the different areas depended on the relative fertility of the soil, but more on accessibility to river transportation. A considerable number of blue grass Kentuckians, cashing in on increased land values, were coming to Missouri with capital and slaves, and became the ruling class along the Missouri from Callaway and Cooper countries westward and along the upper Mississippi. A similar society developed in the Platte Purchase, the northwestern corner (the original western boundary was a straight line) added to the state in 1837. Steamboats—the first reached St. Louis in 1817 and Franklin in 1819—were supplementing the rafts and flat boats, and stage lines of a sort were running from St. Louis to the western border. Settlers were taking up the narrow fertile valleys in the Ozarks, but the considerable settlement of the rougher country there belongs to the 1850's. Springfield, in an island of desirable land, began about 1830; the other towns of importance were on or near the two rivers.

The upper Missouri fur trade and the Santa Fe trade provided the romance and adventure. William Henry Ashley, the successful pioneer in the fur trade, after disastrous failures in the present Montana, made a fortune from the area north of the Great Salt Lake. His Rocky Mountain Fur Company did not have fixed trading posts or hired hunters. The furs were gathered by the "Mountain Men" who every year brought their furs to an agreed upon rendezvous and got their supplies. These hunters covered all the northern Rockies; Jim Bridger, with a deer skin and a bit of charcoal, could draw from personal experience an acceptable map of the whole region. Jedediah Smith, with a handful of companions, struck south along the Colorado and into southern California, then north to the Columbia and back to the Salt Lake region. Ashley beaver was the prime grade on the London market. In the late 1820's the St. Louis merchants reluctantly admitted John Jacob Astor to the trade, and in the 1830's the American Fur Company, with Astor capital and St. Louis management forced out all competition. With its fixed trading posts and hired hunters, and with the killing off of the beaver and the coming of the silk hat, the romance largely disappeared after 1840. Farther south, back of Santa Fe, Kit Carson, who had run away from Franklin as a lad, was the outstanding figure. Hunter

and trader, scout and guide of government expeditions, and Indian agent, he has somewhat the same place among the "Mountain Men" that Daniel Boone has among the Ohio Valley path breakers.

The fur from the southern Rockies came out to St. Louis by the overland trade with Santa Fe. This trade was always chiefly by individual adventurers, who outfitted at the western Missouri River towns, and rendezvoused for the annual caravan in southern Kansas. They took out in their covered wagons manufactured goods, especially textiles, and brought back fur, gold and silver bullion, horses, and the ancestors of Missouri mule. Individuals and small groups suffered severely from the Indians, who seldom attacked the caravan. The trade was profitable, often netting 50 per cent, and brought into Missouri as much as \$200,000 in bullion in one year.

The hunters and fur traders contributed little to the development of the Far West except the knowledge of the trails and mountain passes. They were followed in the 1840's by an increasing migration of Missourians to settle in Oregon and California, all before the Forty-niners. Stephen Fuller Austin, the father of Texas, had earlier managed his father's lead mining interests in Missouri, and Missourians were prominent in early Texas history. The Missourians at home were keenly interested in the annexation of Texas and the resulting Mexican War, to which they contributed Col. Alexander W. Doniphan's extraordinary expedition. A force of some 300 regular cavalry under a regular army officer, and a thousand mounted Missouri militia, went down the Santa Fe trail and occupied Santa Fe. The regulars then went on to California, and Doniphan, with his little force and no base of supplies or support, struck south to the Rio Grande and on to Chihuahua in northern Mexico. The expedition from the seacoast he expected to meet there had been countermanded, but with considerable difficulty Doniphan got his men out to the east coast and finally home by steamboat up the Mississippi.

The Mormons furnished another colorful incident. In 1831 their leader, Joseph Smith, came to Independence, declared it to be the future Zion of his church, and dedicated the temple site. After his return East, the Mormons came in increasing numbers, and friction with the "gentiles" developed until mob violence forced the Mormons to flee across the Missouri. Received with sympathy at first, they soon faced a similar situation. The legislature then created Caldwell County, well north of the river, with the tacit understanding it was to be a Mormon county. When Smith and the main body of his church came out from Ohio, the county was too small for them. Guerrilla warfare ensued, climaxing in the calling out of the state militia, and the agreement of the Mormons to withdraw to Nauvoo, Ill., their last station before the long trek to Utah. Their combination of church and state, with the fear that they would thus secure political control, and their open opposition to slavery were major causes of friction. The Mormons still own the temple site at Independence and have acquired extensive real estate holdings there.

Like all Westerners, Missourians took part in politics very seriously, though more interested in aggressive leaders than in abstract principles. In the inconclusive presidential election of 1844

Missouri voted for Clay; the popular anger at the election by the House of Representatives of Democrats over Jackson, the other Western candidate, gave Jackson a majority in every county in 1828. By 1836 the leaders had transformed their devotion to "Old Hickory" into the well-organized and disciplined Democratic Party. The Whigs, strongest in the towns and in the wealthier, slaveholding river counties, reluctantly followed suit. Thomas Hart Benton, United States senator from Missouri since 1821 and administrative leader in the Senate after 1829, was the dominant leader of the Democrats.

The economic and social changes of the hectic 1850's nearly transformed the state. With the gold rush came the development of the overland traffic, with St. Louis as the supply center, steamers to St. Joseph and the growing Kansas City, and on by ox and mule teams. St. Joseph was the starting point of the famous Pony Express to California. The rapid development of the upper Mississippi Valley and the growing Southern market, with the increasing specialization in cotton, were added stimuli to trade and St. Louis. The coming of the railroads was a outstanding change. Beside the need for better transportation within the state was the conviction of Benton and the St. Louis interests that a railroad across the state would inevitably make St. Louis the eastern terminus of the proposed transcontinental railroad. As liquid capital for construction was lacking, in 1851 the state loaned \$2,000,000 in state bonds to the proposed Pacific road to Kansas, and followed with loans for four other lines, all but the Hannibal and St. Joseph, starting from St. Louis. In the 1850's the state thus invested over \$23,000,000 and most of the roads received also federal land grants, and grants from St. Louis and the counties through which they ran. The results were disappointing. By 1860 only one, the Hannibal and St. Joseph, financed in Boston, was completed; the Pacific had reached Jefferson City, the Southwest Branch stopped at Rolla, the present day branch at Macon. But clearly a new economic era was dawning.

In population, in 1860, Missouri topped the million mark with more than half natives of Missouri. Of the total white population, 15 per cent were born in free states, chiefly Ohio, Indiana, and Illinois; about 15 per cent were foreign born, chiefly German and Irish. More than half of these were in St. Louis and constituted more than half of its population of 190,500. That is, nearly a third of the total population and nearly two-thirds of the population of St. Louis were born in free states or abroad. As people, as in economics, the earlier Southern coloring was fading out. The institution of slavery itself was a fading ground; the percentage of slaves in the total population, steadily declining since 1830, had dropped to about 9 per cent in 1860. The institution was holding its own only in some 20 of the older, richer river counties, where in 1860 the percentage was over 25 per cent. Slaveholdings for the most part, were small and the majority of slaves were household or personal servants. They were used also for growing tobacco and hemp, but even more for general farming. The typical plantation of the lower South, with the absentee landlord, hired overseer, and field gangs, was not to be found in Missouri, where the institution was essentially patriarchal.

The downfall of Benton and the break up of the Whig Party confused the party politics of the decade. Benton lived chiefly at Washington, had little interest in patronage or a personal machine, and by his arrogance embittered the local leaders. He very wisely opposed the immediate annexation of Texas and finally broke with President Polk and became a free lance at Washington. He was never reconciled to the growing dominance of the Southern wing in party control. When in 1849 the local leaders passed a legislative resolution criticizing his policies, he stumped the state in a vitriolic appeal to the rank and file, but failed to secure a majority in the legislature. He nearly recaptured control of the party in 1852, prevented the election of anyone as senator in 1854, and, although mortally ill, again stumped the state in 1856. A coalition of old line Whigs and Benton Democrats came within a few hundred votes of electing him governor in the special election of 1857. Benton's strong nationalism and anti-Southern views forced the victorious anti-Benton leaders generally into a close alliance with the Southern wing of the Democratic Party. In the presidential election of 1860, however, the rank and file of the party compelled them reluctantly to support Stephen A. Douglas, a Westerner and champion of local home rule on the slavery question. Douglas carried the state, with John Bell, favoring moderation and compromise, second, and with John Cabell Breckenridge and Lincoln, the extreme sectional candidates, well in the rear.

The secession of South Carolina presented Missouri and the border slave states with a most difficult choice. Except for the Southern market, her economic interests were clearly Northern and Western, her population was changing, and the nationalistic tradition of Jackson and Benton was still strong. On the other hand the Old Guard of the dominant party was strongly pro-Southern and the well-to-do ruling class in the older sections looked on Kentucky and Virginia as their original homeland, regarded the Southerners as kinsfolk, and believed Lincoln and the Republicans to be revolutionary abolitionists. No wonder most Missourians in the first months of 1861 hoped desperately for compromise and the avoidance of civil war. The convention meeting in March did not include a single advocate of immediate secession, and, defeating the attempt of the pro-Southern minority to pledge Missouri to secession if compromise failed, by a two-thirds majority pledged Missouri's support to any peaceful settlement.

But what if compromise failed? The incoming governor, Claiborne F. Jackson, had been trying in vain to induce the legislature to put the state on a war footing, avowedly to defend the state's neutrality. Even after the firing on Fort Sumter in April, and Jackson's indignant refusal to obey Lincoln's call for troops, the legislature still hesitated. When the governor established a camp of militia just outside of St. Louis, the federal commander there, Nathaniel Lyon, broke it up; on its return, his force, composed largely of Germans, fired into a civilian mob and the state was in an uproar. The governor secured his war powers and when, in June, he called for 50,000 volunteers for a state army, Lyon occupied Jefferson City, and the officials fled to the southwest. This federal interference and the unfortunate Camp Jackson affair, all of debatable necessity, certainly drove thousands of Mis-

sourians into Jackson's militia and eventually into the Confederate Army. Perhaps the only absolutely safe conclusion is that whether Missouri, given a free choice, had seceded or not, a militant minority would have resisted the decision.

Lyon followed Jackson but was defeated and killed at the Battle of Wilson's Creek near Springfield; the Jackson militia under Sterling Price then marched north to the Missouri River, but retreated precipitately when federal troops came up the river. In October, Jackson convened a rump of the legislature at Neosho, which passed an ordinance of secession, and Missouri was formally admitted to the Confederacy. The decisive defeat of the Confederate Army, now including Price's Missourians, early in 1862 at the Battle of Pea Ridge in Arkansas, ended any chance of establishing a Confederate state government by force. In 1864, Price came in from the southeast, marched across the state and barely escaped capture near Kansas City. The primary object of both his expeditions was to free the Missourians for revolt and for joining the Confederate Army; the response in both cases was very disappointing.

After the flight of Jackson from Jefferson City, the old convention, controlled by the conservative Unionists, reconvened and appointed Hamilton R. Gamble, an old line Whig, as provisional governor and authorized him to borrow money and organize a militia. This loyal state government was recognized by Lincoln, who aided Gamble to equip his militia. Gamble and the convention—it did not dissolve until 1863—were moderate and conciliatory and won the acceptance if not the too active support of the great majority. Throughout 1862 and much of 1863, local government broke down over much of Missouri, with local civil wars and guerrilla raids, and much destruction of public and private property, but law and order was slowly restored.

Meanwhile there was a steadily rising Radical opposition to the Gamble regime. Originally unconditional Unionists, the Radicals by 1863 were demanding immediate abolition of slavery and more drastic treatment of Confederate sympathizers. They won the election of 1864, which restored a regular state government and, in the Constitutional Convention of 1865, abolished slavery immediately and without compensation, and, by the "ironclad" test oaths, sought to disfranchise and exclude from the professions even passive sympathizers with the Confederacy. The new constitution was ratified by a narrow majority, provided by the absentee soldier vote.

The growing unpopularity of the Radicals because of the test oaths was increased by their action on the railroads. All the state-aided roads, except the Hannibal and St. Joseph, were hopelessly in arrears on the interest on the bonds loaned them, their rolling stock was worn out, and rights of way seriously damaged. So the state foreclosed on most of them and sold them, recovering a little over \$6,000,000 of an overall investment of over \$31,000,000. An important condition of the sales was the completion of the roads, which was accomplished by 1872. Unverifiable stories of graft and favoritism, and numerous unsuccessful or fraudulent local railroad promotions added to the popular dissatisfaction. The Democratic Party, reorganized by Unionists such as John Smith Phelps and Francis Preston Blair, was hopelessly handicapped by the test

oaths. However, a large minority of the Radicals had accepted the test oaths with reluctance as a temporary measure and demanded their repeal after the 15th Amendment in 1869 gave the Negro the vote; they demanded "universal suffrage and universal amnesty." Under the leadership of Carl Schurz they nominated a separate ticket in 1870, and with the aid of the Democrats elected B. Gratz Brown, governor. In the same election the voters repealed the test oaths and the Radical regime was over. The attempt to make this coalition of Liberal Republicans and Democrats nationwide was defeated in the presidential campaign of 1872, and the local Liberals drifted back to the regular parties.

The last three decades of the century were a period of recovery and readjustment. The bitter hatred engendered by the Civil War, the Kansas border troubles, and the work of the Radicals made it possible for the James (Frank) and Jesse boys to pursue outlawry for twenty years, becoming new Robin Hoods in the eyes of many ex-Confederates. Economically the state had suffered severely as a result of the war. Railroads were destroyed and bankrupt; the emancipated slaves had been worth at least \$40,000,000, and more important, Missouri had lost its chance of continuing as the single gateway to the Far West. Chicago by 1870 had surpassed St. Louis in population and influence and was emerging as the railroad, distribution and meat packing center of the upper Mississippi Valley and the connecting link with the Far West. The rapid spread of railroads across the state and into the Great Plains gave St. Louis and the new metropolis, Kansas City, a new but restricted trading area. Meat packing, wheat feeder marketing, banking, and transportation centered in these two cities and Kansas City grew rapidly.

The farmer was passing through a period of falling prices and difficult transition from subsistence farming to a money economy. Dissatisfaction with railroads, low prices, and restricted currency drove him into Granville politics in the 1870's and the Farmers' Alliance in the 1880's, but the state Democratic Party supported free silver, so the Greenback and Populist parties never gained ascendancy. Conservatism in politics was manifest by a program of low taxes, economy, and a refusal to expand governmental activities and services. The Democratic Party won all elections after 1870, in 1894, but its majority was often small.

The younger generation's growing impatience with conservatism was manifest in the popularity of William J. Bryan who carried the state in 1896 and 1900. In 1904, Theodore Roosevelt swept the state into the Republican column, the first time since reconstruction days, and young Democratic circuit attorney of St. Joseph W. Folk, was elected governor after had broken the power of the notorious Butler (Edward) machine in St. Louis. Folk supported a progressive program in state politics. Herbert S. Hadley, a Republican, elected attorney general with Folk in 1904, convicted the Standard Oil Company under the state's antitrust law, was elected governor in 1908. As a result of the leadership of Folk and Hadley, Missouri adopted many progressive measures such as direct primary, stricter control of railroads, pure food law, the initiative and the referendum. Champ Clark, United States congressman

Missouri and speaker from 1910 to 1918, missed a Democratic nomination for president by a narrow margin in 1912. Since 1904, Missouri has been a doubtful state, usually voting with the party that carried the nation. Only in 1940, when Republican Forrest C. Donnell was elected governor, has the governorship gone to the minority party. Democrats probably outnumber Republicans, but it is the independent voter and the dissatisfied party member who stays at home on election day that determine the outcome of Missouri's elections.

After 1920, Missouri moved into an era of expanded state services. The state highway system was planned and started in the 1920's, the 1930's saw the coming of social security, and enlarged state expenditures for education. The state budget of 1917 of 17 million dollars had grown by 1945 to 120 million. In the years 1838-1940, Missouri had its most spectacular interparty struggle when Governor Lloyd C. Stark broke with the Democratic organization.

Thomas J. Pendergast in Kansas City and with the assistance of United States District Attorney Maurice M. Milligan, convicted Boss Pendergast of income tax evasion, growing out of insurance frauds, and sent him to the federal penitentiary.

More important than party politics were the rapid social and economic changes that took place. The extension of the state road system into all parts of the state opened the isolated sections and greatly changed the whole pattern of rural and urban life. The rapid spread of the power-driven farm machinery and the development of specialized agriculture led to larger farms, less need for manpower, and thence to a steady drop in rural population. By 1940 over half of Missouri's population was to be found in the urban areas and over 90 of the 114 counties were losing population. The growth of high schools in number and enrollment was very rapid after 1920. Since 1930 school buses are bringing more and more children to central schools and the state has greatly increased its share of the total educational cost. Plans for expenditure of nearly 300 million dollars for an expanded highway system in the postwar period is symptomatic of the new era of the welfare state.

The continued growth of the Kansas City and St. Louis metropolitan areas and the development of each as an air center is further evidence of their ascendancy as dominant influences in the state and region. The retarding influences of the Civil War and postwar period have been overcome. Trends and ideals in step with 20th century concepts are dominant. Missouri farmers use modern farming methods and have developed large cooperative marketing and buying organizations. But the Missourian, especially the rural Missourian, retains quite a bit of his conservatism, his suspicion of too much government, his dislike of federal controls. He also retains his older loyalty to a new idea when it is thoroughly accepted. There is still much truth in the popular slogan "I'm from Missouri and you'll have to show me," but it might well be added, "but you don't have to show me but once."

JONAS VILES,

Late Professor Emeritus of History, University of Missouri.

Read and revised by W. FRANCIS ENGLISH, *Professor of History, University of Missouri.*

MISSOURI, University of, a higher educational institution established by an act of the General Assembly of the State of Missouri, approved Feb. 11, 1839, two days after the approval of the act establishing the public school system of the state. In June of the same year the university was located at Columbia, Boone County, which is near the state's geographic center. The cornerstone of the main building was laid July 4, 1840, and in the following spring, April 1841, instruction in academic courses was begun. The first class, consisting of two members, was graduated in 1843. Something of the growth of the university is indicated by the fact that in 1947 it awarded 852 undergraduate and graduate degrees. Women were admitted to the teacher-training department of the university in 1869. Since that time all other departments have been opened to them on the same terms as to men, and gradually the proportion of women students to men has grown.

The government of the University of Missouri is vested in a board of curators, consisting of nine members appointed by the governor of the state, the terms of three members expiring every two years.

The university has extended its educational scope to include in the curricula of its various schools and colleges theoretical instruction and practical training in all the leading activities of its constituents. Starting in 1841 with only an academic department, it is now composed of the following colleges and schools: College of Arts and Science, College of Agriculture, College of Education, School of Law, School of Medicine, College of Engineering, School of Mines and Metallurgy, School of Journalism, School of Business and Public Administration, Graduate School, and the Adult Education and Extension Service.

The School of Mines and Metallurgy is at Rolla, Phelps County, Missouri; the other divisions are at Columbia. In addition to the work of the above schools and colleges, emphasis is given in particular lines of study by the establishment of minor divisions, chief of which are the Agricultural Experiment Station, the Engineering Experiment Station, the Missouri State Military School, the Mining Experiment Station at Rolla, and departments offering degrees in nursing, social work, forestry, veterinary science, and music. The university also holds a summer session. In all the divisions of the university the laboratory method is followed. A 20-acre tract of timber land near the university is used for experimental work in forestry and a demonstration forest. About five miles south an 80-acre tract is used for experimental work in horticulture. On a 90-acre tract two miles north of the university is a new plant for the manufacture of hog cholera serum. The university also

has a forest of 50,000 acres in the Ozark Mountains of southern Missouri, and a forestry and pasture experiment area of over 7,000 acres in St. Charles County. The libraries of the university are the general library; law library; medical library; engineering library; agricultural library; collections in the chemical, geological and zoological buildings; and the library of the School of Mines at Rolla.

Statewide programs in fire and police training and training for rural newspaper correspondents are also conducted along with many other programs. The Agricultural Extension Service has one or more county agents and home agents in each of the 114 counties of the state.

Scholarship at the university is promoted by the offering of a large number of fellowships, scholarships, and prizes.

The university is now supported and maintained by appropriations from the state treasury, by federal appropriations, income from its endowment funds and by the fees and deposits received from students. Tuition is free to residents of Missouri; students from other states pay a tuition fee. The total enrollment (1947-1948) was 15,087.

MISSOURI COMPROMISE. When the State of Louisiana, comprising the southern part of the Louisiana Purchase, or Lower Louisiana, was admitted to the Union in 1812, Upper Louisiana, of which St. Louis was the capital, was organized as the Territory of Missouri. Popular and legislative petitions were presented to Congress by the inhabitants in 1818 and 1819 requesting statehood with boundaries approximately those of the present state. However, slavery had existed in the territory since French colonial days, and in 1819 the United States comprised an equal number of slave and free states. The admission of Missouri as a slave state would, therefore, have given the Southern agrarian slaveholding states majority control of the Senate, a prospect most distasteful to the free states of the North with their rapidly developing industrial economy. But perhaps more important than the economic issue was the moral question—whether the government should foster and extend slavery or discourage and eventually destroy it. Representative James Tallmadge of New York proposed to add to a House of Representatives bill, which authorized Missouri to frame a state constitution, an amendment prohibiting the further introduction of slaves into Missouri and providing that all children born of slaves should be free at the age of 25. Passed by the House (Feb. 16-17, 1819), the amendment was rejected by the Senate, after which Congress adjourned. Before Congress reconvened in December 1819, Maine had formed a constitution and asked admission as a free state. The House passed an act admitting Maine and the Senate joined to it an act admitting Missouri without mention of slavery. However, Senator J. B. Thomas of Illinois offered an amendment to the Senate bill which would admit Missouri as a slave state with the proviso that, in what remained of the Louisiana Purchase (an area far greater than the states of Louisiana and Missouri combined), slavery should be prohibited north of 36° 30' north latitude. The debate that followed electrified the nation. On March 1, 1820, the House passed a bill admitting Missouri as a free state; the Senate struck out the anti-

slavery provision and added the Thomas amendment. The compromise consisted in admission of Maine as a free state (March 3, 1820, effective March 15), and authorization of Missouri to form a constitution with no restrictions on slavery, March 6, 1820. But Missouri's statehood was delayed to Aug. 10, 1821, until she had agreed by a further congressional compromise of March 2, 1821 that nothing in her constitution should be interpreted to abridge the privileges and immunities of United States citizens. The compromise was repealed in 1854 by the Kansas-Nebraska Bill (q.v.).

MISSOURI RIVER, the largest western tributary of the Mississippi River, in the United States, drains with its tributaries an area of more than half a million square miles, more than one third of the entire Mississippi Valley. From its utmost source, at an elevation of 8,000 feet in the Rocky Mountains, to the mouth of the Mississippi on the Gulf of Mexico, it is the longest continuous waterway in the world—4,221 miles.

The Missouri is formed by the confluence of three sizable streams—the Jefferson, Madison, and Gallatin rivers—rising in or near Yellowstone Park. From Three Forks (elevation 4,045 feet) in southwestern Montana, the stream flows swift and clear through scenery of strange and lovely grandeur for nearly 500 miles. At first its course is northeast past Helena, capital city of Montana, and through an imposing gorge called the Gates of the Mountains. It then flows northeast to the Great Falls of the Missouri, a series of cascades—the largest 87 feet high—which occupy the river bed for a distance of more than 10 miles. These falls were the of navigation in the old steamboat days.

After receiving the waters of Marias River, the stream turns near the Bear Paw Mountains and flows eastward across Montana, its principal tributaries being the Judith, the Musselshell, and Milk rivers. Immediately after reaching western boundary of North Dakota, the Missouri is augmented by the turbid waters of the Yellowstone. From that point its irregular course is generally southeast, then south, through North Dakota; a number of towns, including Bismarck, the state capital, stand upon its banks. In North Dakota the principal tributaries come in from the west: the Little Missouri, Heart River, Cannonball River.

Flowing south and east through the prairie of South Dakota, the Missouri receives the waters and silt of Grand River, Moreau River, Cheyenne River, Teton River, White River, James River. Leaving South Dakota, the Missouri forms the boundary between Nebraska and Iowa, receives the waters of the Niobrara, Big Sioux, and the Platte, and passes the cities of Yankton and Omaha in Nebraska, Sioux Falls and Council Bluffs in Iowa, flowing on to the Missouri—and then the Kansas—line. For a few miles it forms a boundary between these states. In Kansas the chief cities on its banks are Atchison, Leavenworth, and Kansas City.

From Kansas City, Missouri, the river flows roughly eastward across the State of Missouri to its mouth, 2,547 miles from Three Forks. Missouri its principal tributaries are the Kaw, Kansas River coming in from the west, Osage and Gasconade rivers from the south, and Grand River from the north. St. Joseph and Jefferson City, the capital of Missouri, stand

its banks. The mouth of the Missouri is less than 20 miles above the City of St. Louis.

Above Great Falls, Montana, the river is navigable by small craft, and also between Great Falls and the Fort Peck Dam just below the mouth of Big Dry Creek. Below the mouth of the Yellowstone its course lies through the Great Plains, the alluvial apron of the Rockies. The surface of the water generally lies from 100 to 300 feet below the level of the surrounding country. In places the bluffs hem the stream in closely, but for the most part the bottom land between the bluffs is much wider than the stream, sometimes measuring as much as 15 miles across. The sandy soil of this flood plain is deep, soft, and easily eroded, and the river constantly changes its irregular course, undercutting its banks, sometimes washing away whole farms, villages, and suburbs, altering state boundaries, and causing untold damage. Floods on the Missouri are often caused by the discharge of flood waters from a single large tributary, while the river above and below the flood is at a stage of low water. During the last hundred years, millions of dollars were spent attempting to control the stream and make it navigable, and now a Missouri Valley Authority is planned with the purpose of harnessing the stream. The Fort Peck Dam on the upper Missouri, the largest earth-fill dam in the world, two miles long, half mile wide at its base, and 242 feet high, is a first step towards this tremendous task.

The Missouri below the Fort Peck Dam is seldom navigable except during the season of high water. In March and April melting snows and spring rains on the plains fill the stream and his flood stage is renewed in June when snows are melting on the mountains. In midsummer floods subside. Even during the season of high water the stream was navigable in old times only by the Indian's bullboat or coracle made of buffalo skins stretched over a basket of willow ticks, by dugout canoes, rafts, or flat-bottom packinaw boats with rudders, by keelboats 60 feet long with a beam of less than 20 feet, or by steamboats drawing only three or four feet of water. The Missouri was said to be "too deep for poling, too swift for rowing, too crooked for sailing, and without any bank for a path." Most of the keelboats were towed up the river a dozen laborious miles a day by means of a long cordelle attached to the top of the path at which the trudging crew of "bushwhackers" tugged.

The first steamboat, *The Independence*, ventured up the Missouri as far as Franklin in 1819. The American Fur Company sent steamboats far up the Missouri as early as 1830 and for thirty years after that steamboats multiplied on the river, in spite of a shocking number of wrecks. After the Civil War, railroads supplanted water traffic.

Navigation on the Missouri has always been hazardous because of its rapidly changing currents, varying water level, dangerous islands, sandbars, and bends, driftwood, snags and sawyers planted in its bed, and concealed by the vast amount of silt clouding its waters, which earned for the stream its popular nickname, "the Big Muddy." Each year the Missouri carries into the Mississippi more than half a million tons of silt. The mean average descent is 19 inches per mile. At the mouth the average flow of water is second is nearly 100,000 cubic feet. There water level may vary as much as 25 feet.

The Missouri River has a colorful and dramatic history. It was discovered in 1673 by Père Marquette and Jolliet. Following his purchase of Louisiana from Napoleon I, President Thomas Jefferson sent Meriwether Lewis and William Clark to explore the stream (1804-1806). Afterward it became a principal highway for fur traders, gold-seekers, and pioneers traveling to the Northwest. It was also, and remains through much of its course, the boundary between the woodlands and the plains, between farms and ranches. It has therefore been said that the Missouri is "where the West begins."

Because of its importance as a highway and a boundary, the Missouri was for many years a frontier fortified with a long chain of trading forts, missions, and military posts devoted to the conquest of the Plains Indian tribes. Appropriately the stream, once dubbed the River St. Philip by a French king, has retained its native name, that of one of the many Siouan tribes living upon its banks.

MISSOURI VALLEY, Iowa, city in Harrison County; altitude 1,006 feet; on the Willow River; 21 miles north of Council Bluffs, and about 120 miles west of Des Moines, the capital of the state; on the Chicago and North Western Railroad. It is in a fruit-growing and stock-raising district; is a trading and shipping point for farm produce; and has a large trade in hogs. It has manufactures of flour and dairy products. Settled between 1854 and 1856, it was known as McIntosh Point and later as St. Johns. It has a Carnegie library. Pop. (1950) 3,546.

MISSOURI VALLEY COLLEGE, in Marshall, Mo., a coeducational institution founded under the auspices of the Cumberland Presbyterians in 1888. The courses lead to the ordinary college degrees. For meritorious students there are available about 30 endowed scholarships which pay \$100 to \$200 yearly. The Murrell Memorial Library, recently erected, has some 30,000 volumes. In 1948 the college plant was valued at \$948,000 and the endowment exceeded \$589,000. There were 35 faculty members. The student body included 466 men and 170 women.

MISTASSINI, mis-tà-sē'nē, Canada, (1) a lake in the province of Quebec, located about 300 miles north of the City of Quebec. It is 100 miles long, 12 miles wide, and has an area of 975 square miles. It drains by Rupert River into James Bay. (2) A river in Quebec, 185 miles long, which flows into Lake St. John.

MISTLETOE, a popular name for several related shrubs parasitic upon various deciduous trees, such as apple, thorn, maple, poplar, locust, linden, but rarely oak. The European or common mistletoe (*Viscum album*) of the natural order Loranthaceae, is the one referred to in

poetry and prose but a relative named *Phoradendron flavescens* is the species most commonly found at Christmas time in the markets of America. The former, which is common almost throughout Europe, is an evergreen, bifurcately branched shrub, with opposite, almost sessile, oblong, leathery leaves; inconspicuous flowers in small terminal heads or in the angles of the branches, the pistillate and staminate flowers upon separate plants; and whitish, translucent, glutinous berries about a quarter of an inch in diameter. The stickiness serves to attach the berries to the host plant until germination is complete, the sprout, it is said, always turning toward the point of attachment. The American or false mistletoe is similar in habit and appearance, and has fallen heir to some of the traditions and functions of its European cousin, especially the Christmas practice of kissing under a suspended sprig. Anciently the European species was held to be sacred by the Druids and the Germans, and by the Celts was credited with magical properties, references to all of which are frequent in literature. Its formerly reputed value in medicine has also passed away. Several other species are well known, especially the fragrant flowered *Loranthus odoratus*, and *L. europæus*; the latter being distinguished for its racemes of flowers and its frequent appearance upon oak trees. The common American species mentioned above ranges from New Jersey to Indiana and southward to Florida and Texas. Several related species are found on the Pacific coast.

MISTRAL, mēs-träl, **Frédéric**, French poet: b. Maillane, Bouches-du-Rhône, 8 Sept. 1830; d. there, 25 March 1914. He studied law for a time, but abandoned it and gave his attention to writing in Provençal, the dialect of southern France, which, under the influence of Jasmin, the "barber-poet," had entered on a renaissance as a literary medium. In 1854 he, with six others, founded the well-known Society of the Felibridge; and in 1859 he published his 'Mireio,' a narrative poem in the recovered language, which was crowned by the Académie in 1861. A second work in verse, 'Calendau,' came out in 1867; a volume of poems, 'Lis Isclo d'Or' (The Isles of Gold), in 1875; 'Lou Trésor dou Felibridge,' a dictionary of modern Provençal, in 1878-86; and the historical poem 'Nerto,' in 1884. 'La Rèino Jano' (1890) is a tragedy, and 'Le Poème du Rhône' (1879), another narrative poem. There are English renderings of 'Mireio' by Grant (1867), Crichton (1868) and Preston (1872). In 1904 he was awarded, jointly with José Echegaray, the Nobel prize in literature. Consult Downer, 'Frédéric Mistral' (1901).

MISTRAL, the local or provincial name of a strong northwest wind, which, blowing from the Alps, forms one of the scourges of Provence and the valley of the Rhône. It is caused by low atmospheric pressure in the Gulf of Lyons with high pressure in the north, and corresponds with the "bora" of southern Russia. It blows with great violence during the winter and spring months. Its approach is indicated by a sudden change in the temperature from warmth to cold; the air becomes purer and more invigorating, light fleecy clouds are seen in the sky and at night the stars shine

with extraordinary brightness. The tempest it causes in the Mediterranean from Ebro to the Gulf of Genoa is very dangerous to small vessels.

MISTRETTA, mē-strèt'ta, Sicily, town in the province of Messina, 34 miles northeast of Caltanissetta, 50 miles northwest of Catania and about 11 miles from the sea. It is in the most fertile region of Sicily and is 3,200 feet above sea-level. Lignite is mined in the vicinity. The chief industries are farming and cattle-raising. An annual fair is held here. The name was anciently Aniestratus. Pop. about 15,000.

MISTRIAL, a trial which is erroneous on account of some defect in the persons trying, as if the jury come from the wrong county, or because there was no issue formed, as if no plea be entered, or some other defect of jurisdiction. Where a jury is discharged without a verdict, the proceeding is properly known as a mistrial. Consent of parties cannot help such a trial, when past. It is error to go to trial without a plea or issue, in the absence of counsel and without his consent, although an affidavit of defense be filed in the case, containing the substance of a plea, and the court has ordered the case on the calendar for trial. On an indictment for perjury, an infant under the age of 21 years, and not otherwise qualified, not having, in fact, been summoned, personated his father as a juror. Here was a mistrial, because the verdict in the case was the verdict of but 11 jurors. A mistrial leaves the parties to an action *in statu quo ante*, and in criminal cases the indicted person may be retried as at a mistrial such a person is not considered to have been placed in jeopardy. See TRIAL.

MISU, Nicholas, Rumanian diplomat, represented his country (with M. Brătianu) at the Peace Conference in Paris. By origin a Macedonian Rumanian, M. Misu adopted Rumanian citizenship and served for many years in Balkan capitals. In London he carried on the negotiations with the British government relating to Rumania's entry into the war. He was called home when the conclusion of peace with Germany became inevitable to negotiate terms with the conquerors. He possesses a remarkable knowledge of European and Balkan languages.

MITANNIANS, a race dwelling in Mesopotamia in the 2d millenium B.C. and that came to light by the discovery of some cuneiform tablets found in the rock tombs of Tell-el-Amarna in Upper Egypt (between Memphis and Thebes) in 1887-88. These clay tablets contained Egyptian correspondence with Babylonia, Assyria and other ancient nations. In these tablets, through the scholarship of learned Orientalists, it was discovered that there was a kingdom of Mitanni in northern Mesopotamia which had important relations with Egypt. Moreover, this country was identified as Aram-Naharayim (Aram of the Two Rivers), called in Syriac, Beth-Nahrin, i.e. "the land of the rivers"—Euphrates and Tigris—and meaning particularly the northern portion of Mesopotamia. Aram-Naharayim, in other words Mitanni, was the home of Balaam and probably his famous animal, for in Deut. xxiii, 4 Balaam is called a native of Aram-Naharayim and Numbers xxiii, 7 reads that

Balaam was brought "from Aram out of the mountains of the east."

The Mitannian kings whose names have been discovered seem to have belonged to the Hittites or Harri, whose capital was at Boghaz Keui, North Cappadocia, explored in 1907. One of these kings, Dushratta whose letters were discovered in the Tell-el-Amarna tablets, was the father-in-law of Amenhotep III of Egypt (1411-1389 B.C.). He was also a contemporary of Subbiluliuma, the Hittite monarch, who seems to have obtained lasting dominion in Syria by subduing Dushratta. Three kings of the same dynasty, Saushshatar, Artatama I and Suttarna I, preceded Dushratta and Ortatama II Artashshumara, Mattuaza and Suttarna II followed him. Some authorities think that this dynasty took possession of the native Mitannians; other authorities find grounds for believing the Mitannians to have been the Hittites, who in 1932 B.C. put an end to the Amoritic dynasty in Babylon and established themselves in Mesopotamia thereafter. Hittite hieroglyphics and cuneiform script were both used among the Mitannians. The gods of this race were the same as in the Babylonian and Assyrian pantheons.

"The discovery of the Tell-el-Amarna tablets revealed to us," writes Dr. A. H. Sayce, "the existence of a new language, once spoken in northern Mesopotamia in the kingdom of Mitanni, the Aram-Naharayim of the Old Testament. One of the letters addressed to Dushratta, king of Mitanni, to the Egyptian Pharaohs is in the native language of his country and its length is such that a comparison of it with those of his letters which are written in Assyrian makes a partial decipherment of it possible. Shortly after the publication of the cuneiform text by Winckler and Abel in 'Mittheilungen aus den orientalischen Sammlungen' (I No. 27) attempts at the decipherment of the language by Professor Brunnow, Professor Jensen and myself appeared simultaneously in the *Zeitschrift für Assyriologie* (Vol. II and III, 1890.) The cuneiform text has recently been subjected to a very careful re-examination by Dr. Knudtzon and the result of his labors is given in the *Beiträge zur semitischen Sprachwissenschaft* (IV, pp. 134-153). In one of the letters of Dushratta one of his envoys is called Tunip-ipri" (Tell-el-Amarna Tablets in the British Museum, 9, 47) "the king of Tunip. This raises a presumption that the power of Mitanni extended as far as Tunip, the modern Tennip, and that the Mitannian language was spoken there. The presumption is confirmed by a letter sent to the Pharaoh by the people of Tunip in which the native words added to the Assyrian translation, where the latter did not seem quite clear or literal enough, all belong to the language of Mitanni. In the Mitannian letter of Dushratta itself the meaning of a few words and forms is cleared up by the ideographs attached to them.

"It is clear that Mitannian is in its general structure a Caucasian language. It resembles Georgian in its habit of piling suffix upon suffix, pronoun upon pronoun, until the verbal forms become almost impossible to analyze. Like Georgian, also, it occupies a middle position between inflection and agglutination. In

this respect it resembles the ancient languages of Asia Minor, so far as we know them, though it is to be noticed that it illustrates the fact that, as we pass eastward, agglutination is more prominent, while westward, as in the case of Lycian, inflection is more pronounced." See HITTITES. Consult Tell-el-Amarna Tablets in the British Museum (1892); Davies, 'Rock Tombs of Tell-Amarna' (1903); Bezold, C., 'Oriental Diplomacy: the transliterated text of the Cuneiform Despatches discovered at Tell-el-Amarna' (1893); 'The Tell-el-Amarna Letters,' English translation by M. Winckler (Berlin 1896); Knudtzon, J. A., 'Die El-Amarna Tafeln' (Leipzig 1907-09); Petrie, W. M. F., 'Syria and Egypt from the Tell-el-Amarna Letters' (1898); Bork, Ferdinand, 'Die Mitannis sprache' (Berlin 1909); Winckler, 'Vorderasien im zweiten Jahrtausend' (Leipzig 1913), and Sayce, A. H., 'The Language of Mitanni' in Proceedings of The Society of Biblical Archaeology (June 1900).

MITAU, m'etou (Lettic Jelgava), Latvia, town and capital of the district of Kurzeme, on the right bank of the river Aa, 26 miles southwest of Riga, on the Riga-Orel Railroad. The town is supposed to have received its name from the German *Mitte in der Aue* and is said to have been founded in 1266 by Conrad Mandern, grand-master of the Order of the Brethren of the Sword. When the Lithuanians plundered it in 1345, it had become an important town. In 1561 the Duke of Courland made it his residence and the palace became the seat of government. This castle, which was situated on an island in the river, was destroyed by Duke Biren, who erected in its place (1738-72), a fine palace, later the official residence. Mitau was captured three times by the Swedes in the 17th century and in 1795, when Russia annexed Courland, Mitau was included. The Duke of Provence (afterward Louis XVIII) made Mitau his home in 1798-1801 and again in 1804-07. Napoleon I captured it in 1812. Mitau is only 12 feet above sea-level and at high water the town is sometimes inundated. A canal surrounds the town in the place of the old fortifications. The streets are broad and regular and many contain handsome residences of the former nobility. Mitau possesses a museum with a library, a gymnasium and a theatre and is the home of the Lettish Literary Society. The chief manufactures are chocolate, oilcloth, ink, flour, iron products and hats; and the town also possesses saw-mills, tanneries and ironworks. The trade is large in grain, cattle and wood. Germans once outnumbered the other races, which include Poles, Letts, Russians and Jews. Most of the inhabitants are Protestant and a general superintendent of the Lutheran Church has his seat there. Pop. 33,048.

MITCHAM, England, a suburb of London, on the river Wandale in Surrey, four miles northwest of Croydon on the London, Brighton and South Coast Railway. It is 10 miles south of London Bridge. The neighborhood abounds in market-gardens and plantations of roses, lavender, peppermint and other herbs for the manufacture of perfumes and essences. Mitcham Common, covering 480 acres, has one of the best golf courses near London. Pop. 30,000.

MITCHEL, mich'el, John, Irish patriot: b. Dungiven, County Derry, 3 Nov. 1815; d. Drumalane, 20 March 1875. He was graduated from Trinity College, Dublin, in 1836, and practised several years as an attorney at Banbridge. Soon after the starting of the *Nation* in 1842, Mitchell began to contribute to that journal and after the death of Thomas Davis, in 1845, became assistant editor. In 1848 he began the publication of the *United Irishman*, for his articles in which he was sentenced to 14 years' transportation for felony. He was sent to Bermuda, and next to Tasmania, whence he made his escape to the United States in the summer of 1853. Here he published a series of short-lived newspapers, the *Citizen* (at New York), the *Southern Citizen* (Knoxville, Tenn.), the *Inquirer* (Richmond, Va.) and the *Irish Citizen* (New York). An advocate of slavery, he favored the Confederates in the Civil War, on which side his three sons fought, and he was at one time under arrest by the Federal authorities. In 1874 he returned to Ireland. He was elected to Parliament from Tipperary, was declared ineligible, but was re-elected. Among his writings are 'Life of Hugh O'Neill' (1845); 'Jail Journal; or Five Years in British Prisons' (1854), and a 'History of Ireland from the Treaty of Limerick' (1868). Consult Dillon, W., 'John Mitchel' (London 1888).

MITCHEL, John Purroy, American public official: b. Fordham, N. Y., 19 July 1879; d. near Lake Charles, La., 6 July 1918. His grandfather was the Irish patriot, John Mitchel, who with his three sons fought in the Confederate army during the Civil War. John Purroy was educated at Fordham College (now Fordham University) and in 1899 was graduated at Columbia University. Two years later he was graduated at the New York Law School and was admitted to the bar the same year. One of his early cases involved a mining claim in South America. His work there in an unhealthy tropical region resulted in a fever and peculiar headaches, one of which is thought to have been responsible for the accident which resulted in his death several years later. His entrance into public life was his appointment by Mayor George B. McClellan as special counsel to the city of New York in December 1906. In April of the following year he was made commissioner of accounts and in this capacity he investigated the office of the borough president of Manhattan, John F. Ahearn. The latter was removed and many grafters were made to feel the heavy arm of the law. All advocates of good government in New York were pleased with the ability and integrity of Mitchel and in 1909 he was elected president of the board of aldermen on a fusion ticket, William J. Gaynor being elected mayor at the same time. In August-September 1910 Mitchel was acting mayor while Mayor Gaynor was recovering from a wound inflicted by a maniac. On 7 June 1913 President Wilson appointed Mr. Mitchel collector of the port of New York and in the autumn of the same year he became the fusion candidate for the mayoralty in opposition to C. S. Whitman, then district attorney of New York County. Mitchel won the nomination and after a bitter campaign defeated Judge Edward E. McCall, the regular Demo-

cratic nominee, at the November election of 1913. Mitchel's administration passed its first year in comparative peace, municipal markets were established, but on a wholly inadequate scale. Storms came in 1915, 1916 and 1917. On the whole the city administration did much to relieve the increasing number of the unemployed. Sections of the city press began to attack the administration for its failure to curtail expenditures, for its attempt to place the city public schools on an undemocratic basis, and above all for its supineness in dealing with certain railroad corporations who were seeking valuable franchise privileges. Other disclosures in regard to the Rockaway land deals and the Brooklyn terminal project further alienated popular support. Mitchel also angered a great and powerful section of his fellow-citizens through the alleged biased and unfair investigation of Catholic charitable institutions sponsored by him, and in which city officials resorted to the illegal method of wiretapping in an unsuccessful effort to involve certain Catholic clergymen and prominent laymen. As a result, at the close of his administration Mitchel found himself strongly supported by all corporation and big moneyed interests in the city, and heartily despised among the masses of the city's toilers. In 1917 he was again a candidate for mayor. By lavish expenditures of money at the primaries his friends endeavored to secure him the nomination but he was defeated by Bennett. Over 21 persons were indicted for fraud in connection with Mitchel's primary campaign. After defeat at the primaries he stood for re-election as an independent candidate, but at the November election he received 149,260 votes, while the Socialist Hillquit received 141,739, and Hylan, the regular Democratic candidate, received a grand total of 298,149 votes, the greatest plurality in New York's history and an emphatic repudiation of Mitchel's administration. On 11 Jan. 1918 Mr. Mitchel was commissioned major in the Aviation Corps of the United States army. He received his cadet training at San Diego, Cal., and soon became noted for his daring in the air. He was transferred to Gerstner Field, near Lake Charles, La., to receive the finishing stages of training necessary for service at the war front. On the morning of 6 July Mr. Mitchel fell from a single-seater scout plane at a height of about 500 feet and was killed. A few days later a public funeral was held from Saint Patrick's Cathedral.

MITCHEL, Ormsby McKnight, American astronomer: b. Morgansfield, Ky., 10 July 1810. d. Hilton Head, S. C., 30 Oct. 1862. He was graduated from West Point in 1829, and was made assistant professor of mathematics there which post he held for two years. From 1832 to 1834 he was counsellor-at-law in Cincinnati, Ohio; from 1834 to 1844 professor of mathematics, philosophy and astronomy at Cincinnati College; and 1836-37 chief engineer of the Little Miami Railroad. He lectured in various parts of the United States on astronomy in 1842-48, raised funds for the building of an observatory at Cincinnati, the cornerstone of which was laid 9 Nov. 1843, and was its director in 1845-59. In 1859 he became director of the Dudley Observatory at Albany, N. Y. He was known as a popular lecturer on astronomy, and

scarcely less distinguished for his mechanical skill. He perfected a variety of apparatus of great use to astronomy. One of the most important of his constructions was an apparatus for recording right ascensions and declinations to within $\frac{1}{1000}$ of a second. He also invented an instrument for the measurement with great accuracy of large differences of declination, such as the ordinary method by micrometer was unable to reach. In 1861 he entered the Federal army as brigadier-general of Ohio volunteers, and on 11 April 1862 was promoted major-general. From 17 September he commanded the Department of the South and the Tenth corps, operating in South Carolina. He was known in the army as "Old Stars." He was a Fellow of the American Academy of Arts and Sciences and an associate of the Royal Astronomical Society of London. He published and edited *The Sidereal Messenger* (1848-58), and wrote 'The Planetary and Stellar Worlds' (1848); 'The Orbs of Heaven' (1851); 'Popular Astronomy'; 'A Concise Elementary Treatise of the Sun, Planets, Satellites and Comets' (1860), both republished (London 1892), and 'The Astronomy of the Bible' (1863). Consult Mitchel, F. A., 'Life of Ormsby McKnight Mitchell' (Boston 1887).

MITCHELL, mitch'el, Anthony, Scottish bishop. b. Aberdeen, Scotland, 24 Oct. 1868; d. there, 17 Jan. 1917. He was educated at Aberdeen University, where he won prizes for his ability in classic studies, and at Edinburgh University and the Episcopal Theological College, and was ordained in 1892. After serving as rector of Saint Mark's Church, Portobello, he became principal and Pantonian professor of theology at the Theological College of the Episcopal Church in Scotland in 1905. He was appointed canon of Saint Mary's Cathedral in 1905, and chancellor in 1912. He was well known in the United States, having come here in 1914 to deliver lectures on theology and on the history of Scotland. His published works are 'Tatters from a Student's Gown' (1890); 'History of the Episcopal Church in Scotland' (1907); 'Story of the Church in Scotland' (1908); 'Biographical Studies in Scottish Church History' (1914).

MITCHELL, Charles, English pugilist: b. Birmingham, 1861; d. Hove, near Brighton, April 1918. He first took to fencing, of which science he became a teacher before he was 20. Adding boxing to his repertory, he had passed through several successful bouts with amateurs until he distinguished himself in 1882 by winning a competition open to all English heavyweights. Although he was little more than a lightweight himself, he had already won a similar competition for middleweights. He was then brought to America to meet John L. Sullivan, who then weighed 204 pounds against Mitchell's 150 pounds. In the second round at Madison Square Garden the Englishman knocked his opponent off his feet, and at the close of the third round the fight was stopped by the police. Mitchell's two-handed blows were so accurate and severe that for a long time Sullivan declined his challenge to a contest under Prize Ring rules in a 24-foot arena. On 10 March 1888, however, they met at Chantilly in France, and after a struggle of 39 rounds, lasting 3 hours, 10

minutes, 55 seconds, the fight was declared a draw. Fought in the open air, in a pouring rain, that battle formed one of the strangest chapters in the annals of old-style pugilism. The rounds varied in duration from 7 minutes, 7 seconds to 10 seconds, Mitchell often going down at the slightest tap to economize his strength. In the earlier stages, Sullivan, with 42 pounds advantage in weight, had much the best of the fighting, but he could never really corner his elusive opponent, who seemed little the worse for the punishment he had received when the draw was mutually agreed to. Mitchell practically retired from the ring after the fight, but returned in 1894, past his prime and out of form, only to be knocked out in the third round by J. J. Corbett after an exciting contest. Mitchell had never been knocked out before. He was married to a daughter of George Washington Moore, popularly known as "Pony" Moore, formerly a circus rider and one of the founders of the Moore and Burgess Minstrels. In temperament Mitchell, though a most brilliant and courageous boxer, was extremely sensitive and quick to take offense.

MITCHELL, Clifford, American physician b. Nantucket, Mass., 28 Jan. 1854. He was graduated at Harvard in 1875; studied medicine in the Chicago Medical College and the Chicago Homœopathic Medical College; began to practise in Chicago in 1878; and devoted himself to diseases of the kidneys. He was for many years professor of chemistry, toxicology, and renal diseases at the Chicago Homœopathic Medical College, and after 1905 of clinical urinalogy and renal diseases at Hahnemann Medical College, Chicago. He is associate editor of the *Clinique* and of the *Phi Alpha Gamma Quarterly*. Has established a diagnostic laboratory in the Marshall Field Annex, and invented a stain for urine sediments and a rapid test for albumin in urine. He is author of 'Student's Manual of Urinary Analysis' (1879); 'Physician's Chemistry' (1884); 'Dentist's Manual of Special Chemistry' (1887); 'Renal Therapeutics' (1898); 'Diseases of the Urinary Organs' (1903); 'Modern Urinology' (1912).

MITCHELL, Donald Grant, American author ('IK MARVEL'): b. Norwich, Conn., 12 April 1822; d. Edgewood, Conn., 15 Dec. 1908. He was graduated at Yale in 1841; studied law in New York; was United States consul to Venice in 1853; and in 1855 settled on his farm, "Edgewood," near New Haven. He wrote much, on various themes, and always with a genial charm and ease of style. His best-known works are the idyllic sketches called 'Reveries of a Bachelor' (1850), and 'Dream Life' (1851). He also wrote 'French Gleanings' (1847), descriptive of his first European trip, as 'The Battle Summer' (1850) was of his stay in Paris in 1848; 'The Lorgnette' (1850), a satiric novel of New York life in the forties; 'Fudge Doings' (1855), another New York society novel; 'The Seven Stories with Basement and Attic,' a series of tales of travel (1864); 'Dr. John' (1866), a religious story contrasting life in Connecticut and in the French Midi; and the more characteristic papers on men, books and outdoors, such as 'My Farm at Edgewood' (1863); 'Wet Days at Edgewood' (1865); 'Rural Studies' (1867);

'English Lands, Letters and Kings' (1889), and 'American Lands and Letters' (1897).

MITCHELL, Edward Page, American journalist: b. Bath, Me., 24 March 1852; d. New London, Conn., 22 Jan. 1927. He was graduated at Bowdoin College in 1871 and joined the staff of the *Boston Advertiser*. After 1875 he was engaged on the editorial staff of the *New York Sun*, of which he became editor in 1911. In 1913 he was special lecturer at the Columbia School of Journalism. In 1909-11 he was president and after that date vice-president of the Sun Printing and Publishing Company. Mr. Mitchell's writings on the editorial page of the *Sun* attracted wide attention for their brilliancy. He also contributed to magazines. He was an overseer of Bowdoin College and a member of numerous clubs. He wrote 'Memoirs of an Editor' (1924).

MITCHELL, Elisha, American scientist: b. Washington, Conn., 19 Aug. 1793; d. on Mount Mitchell, N. C., 27 June 1857. He was graduated at Yale in 1813; four years later became professor of mathematics in the University of North Carolina; and in 1826 was made professor of chemistry, mineralogy and geology in the same institution. The Olmsted-Mitchell Geological Survey (1824-28) did important work under his supervision. He discovered that a peak in North Carolina is the highest in the Eastern States and during a storm he was killed by a fall from this height. It is now called in his honor Mount Mitchell or Mitchell's High Peak, and on its summit he is buried.

MITCHELL, Henry, American civil engineer: b. Nantucket, Mass., 16 Sept. 1830, d. Boston, Mass. 11 Dec. 1902. He was a son of William Mitchell (q.v.), was educated at the Normal School in Bridgewater, Mass., and in 1851 was appointed to government service as a civil engineer under the United States Coast Survey. He acted as assistant to the commissioners on harbor encroachments in New York in 1859 and discovered the underflow of the Hudson. He was later engaged in Boston harbor and assisted in the improvement of the mouth of the Mississippi in 1874. He made an investigation of the Panama Canal scheme under De Lesseps and held many government commissions to investigate the principal harbors along the Atlantic Coast, including Portland, Me., Providence, R. I., Norfolk and Portsmouth, Va., and Philadelphia, Pa. He was appointed professor of physical hydrology at the Massachusetts Institute of Technology in 1869. In 1874 he was the representative of the United States Coast Survey on the board of engineers for the improvement of the mouth of the Mississippi, and later a member of the James B. Eads advisory board and of the Mississippi River Commission. In 1879 he visited the Suez Canal and inspected it under the authority of Ferdinand De Lesseps. He published many reports of surveys, etc.

MITCHELL, Hinckley Gilbert, American biblical scholar: b. Lee, Oneida County, N. Y., 22 Feb. 1846; d. 19 May 1920. He was graduated at Wesleyan University in 1873 and in the theological department of Boston University 1876, and Leipzig University 1879. From 1879 to 1880 he was pastor of the Methodist Episcopal Church at Fayette, N. Y. In 1880-83 he was instructor in Hebrew and Latin in Wesleyan University, and in 1883-1905 professor of Hebrew and

biblical exegesis in Boston University; 1905-06 instructor in the Semitic languages in the same institution. Since 1910 he has been professor of Hebrew and Old Testament exegesis in Tufts College. In 1901-02 he served as director of the American School of Biblical Research in Jerusalem; in 1914 for the summer quarter he was supplying professor in the University of Chicago and lecturer at two sessions of the Summer School of Theology, Harvard University. His most important publications are 'Hebrew Lessons' (1884); 'Amos' (1893); 'The Theology of the Old Testament,' a translation from Piepenbring (1893); 'Isaiah, chapters i-xii' (1900); 'The World before Abraham' (1901); 'Tales Told in Palestine,' in collaboration with J. E. Hanauer (1904); 'Genesis' (1909); 'Haggai and Zechariah' (in the International Commentary 1912); 'The Ethics of the Old Testament' (1912), and numerous articles in *The Journal of Biblical Literature* and various theological publications.

MITCHELL, John, American labor leader: b. Braidwood, Will County, Ill., 4 Feb. 1870; d. New York, 9 Sept. 1919. He entered the mines at Braidwood at the age of 13, and in 1885 joined the Knights of Labor. The next few years he spent in the West and Southwest, and in 1890 settled at Spring Valley, continuing his work at his trade. He read and studied constantly and was a member of several debating societies and reform clubs; he was also active in the labor movement and was president of the Knights of Labor local at Spring Valley. On the formation of the United Mine Workers in 1890 he became a member of that organization, was frequently delegate to district conventions and in 1895 was elected secretary-treasurer of the northern Illinois subdistrict; in 1896 he was chairman of the Illinois mine workers' legislative committee, and in 1897 was made a national organizer of the United Mine Workers. In January 1898 he was elected vice-president of that organization and in September of the same year became acting president; he was elected president in 1899, but retired in March 1908; he was also a vice-president of the American Federation of Labor from 1898 to 1914. During his term of office as president of the United Mine Workers the union was enlarged, wages were increased and the eight-hour day extended; he conducted the strikes of the anthracite miners in 1900 and 1902, and brought the latter to a close by his offer in behalf of the miners to accept the decisions of a commission appointed by the President of the United States. After serving for nearly three years as active head of the Trade Agreement Department of the National Civic Federation, he spent two years on the lecture platform, speaking in all parts of the country. He served on the New York State Commission on Employers' Liability and Workmen's Compensation, which drafted the first compensation law enacted by the State of New York. In March 1914 he was appointed to membership on the Workmen's Compensation Commission of New York State, then created, and when in May 1915 this commission was merged with the State Department of Labor, under the administration of the Industrial Commission, he was made chairman of the Industrial Commission of the State of New York.

MITCHELL, John Ames, American editor, artist, and author: b. New York City, Jan. 17, 1845; d. Ridgefield, Conn., June 29, 1918. He was educated at Harvard, aiming toward an architectural career, and for a time studied at Paris. He was an architect in Boston from 1870 to 1876, after which he became interested in decorative art. He went to New York and engaged in journalism as artist, illustrator, and writer, and in 1883 founded and edited *Life*, an outstanding political-cartoon magazine. He was a member of the National Institute of Arts and Letters, and his published work includes: *Croquis de l'Exposition* (1879); *A Romance of the Moon* (1896); *The Last American* (1889); *Amos Judd* (1895); *The Pines of Lory* (1901); *The Villa Claudia* (1904); *The Silent War* (1906); and *Pandora's Box* (1911).

MITCHELL, John Hipple, American lawyer and senator: b. Washington County, Pa., June 22, 1835; d. Portland, Ore., Dec. 8, 1905. He was educated at Witherspoon Institute and was admitted to the bar of Pennsylvania. In 1860 he moved to California where he established a law practice for a few months, but removed to Oregon and engaged in practice there. He was state senator from 1862 to 1866 and president of the senate in 1864. From 1867 to 1871 he was professor at Willamette University, Salem, Ore. He was elected United States senator from Oregon in 1872, and Democratic opposition tried to prevent him from taking his seat by charges of an ignominious past. He was accused of financial dishonesty, desertion of his family in Pennsylvania, and bigamy, none of which merited investigation, according to the Senate committee on privileges and elections. He was constantly accused of being a corrupt politician and failed reelection in 1871. From 1885 to 1897 he served two more terms in the United States Senate and was returned to the Senate in 1901.

MITCHELL, John Kearsley, American physician: b. Shepherdstown, Va., May 12, 1793; d. Philadelphia, Pa., April 4, 1858. He studied medicine under Dr. Nathaniel Chapman and was graduated from the medical college of the University of Pennsylvania in 1819. He made three voyages to China and the East Indies as ship surgeon and then settled in Philadelphia as a general practitioner. In 1824 he lectured on medicine and physiology at the Philadelphia Medical Institute and in 1826 became professor of chemistry there. He was given the chair of chemistry at Franklin Institute in 1833 where he delivered lectures for five years. From 1841 till his death he was professor of the theory and practice of medicine at Jefferson Medical College. He was visiting physician to the Pennsylvania and City hospitals. In addition to numerous papers published in medical and scientific journals, he wrote *Saint Helena, a poem by a Yankee* (1821) and *Indecision, a Tale of the Far West and Other Poems* (1839), both of which show his interest in poetry. A volume, *Five Essays on Various Chemical and Medical Subjects* (1858), was published after his death.

MITCHELL, Langdon Elwyn (pseudonym JOHN PHILIP VARLEY), American author and playwright: b. Philadelphia, Pa., Feb. 17, 1862; d. there, Oct. 21, 1925. He was educated at St. Paul's School, Concord, N.H., and in Europe. He studied law at Harvard and Columbia universities and in 1886 was admitted to the New

York bar. Through his interest in literature and drama he became a member of the National Institute of Arts and Letters and of the Players Club, New York. His most successful plays were *Becky Sharp* (1899), a dramatization of *Vanity Fair* (q.v.), and *The New York Idea* (1907); his other publications included *Sylvian and Other Poems* (1884), and *Poems* (1894).

MITCHELL, Margaret, American novelist: b. Atlanta, Ga., c. 1900; d. there, Aug. 10, 1949. A graduate of Washington Seminary in Atlanta, she lived in her native city with the exception of a year at Smith College. After a career of writing for the *Atlanta Journal*, she married John R. Marsh in 1925.

Her first and only novel, *Gone With the Wind* (q.v.), was published in June 1936 and overnight became one of the literary phenomena of the 20th century. This colorful, 1,000-page story of the Civil War was 10 years in the writing. It sold at the rate of several thousand copies a day, and was translated into 16 languages. Scarlet O'Hara and Rhett Butler, the heroine and hero of the book, immediately became stock characters in American fiction. Miss Mitchell received the Pulitzer Prize for fiction in 1937.

MITCHELL, Margaret Julia ("Maggie Mitchell"), American actress: b. New York City, June 14, 1832; d. there, March 22, 1918. She was first successful as Julia in *The Soldier's Daughter*, and the title role of *Fanchon, the Cricket* in 1860 made her famous. She was married to her manager, Henry Paddock, in 1868, and continued her career on the stage, playing many famous roles in *The Pearl of Savoy*, *Jane Eyre*, and *Mignon*. She was divorced in 1888 and married Charles Abbott, her leading man, in 1889. Her last public appearance was in April 1892.

MITCHELL, Maria, American astronomer and educator: b. Nantucket, Mass., Aug. 1, 1818; d. Lynn, Mass., June 28, 1889. She was the daughter of William Mitchell (q.v.), noted astronomer, and was educated in the private schools of Nantucket. She was librarian of the Nantucket Athenæum for 20 years and managed to carry on her astronomical studies and observations in her spare time. She first became known as an astronomer by her discovery of a comet in October 1847, and for this discovery she received a medal from the king of Denmark. She later discovered several nebulae and was engaged in computations for the *Nautical Almanac*. In 1848 she was elected an honorary member of the American Academy of Arts and Sciences, the first woman to receive this honor, and in 1857 went to Europe to visit the principal observatories. In 1865 she was appointed the first professor of astronomy and director of the observatory at Vassar College. In order to devote herself unselfishly to the job of teaching, she gave up her research and observation work. She was a member of the American Association for the Advancement of Science and was given the degree of LL.B. by Hanover College in 1852 and by Columbia University in 1887. She resigned from her position at Vassar in 1888 and was made professor emeritus. After her death, a \$50,000-fund to endow the chair of astronomy at Vassar College was completed, and in her honor it was named the Maria Mitchell Endowment Fund. She was a very firm believer

in woman's suffrage, but not active in the suffragist movement; she was, however, a member and for several years president of the American Association for the Advancement of Women. In 1908 the Maria Mitchell Observatory was dedicated at Nantucket. The Maria Mitchell Astronomical Society was named in her honor. Consult Babbitt, M. K., 'Maria Mitchell as Her Students Knew Her' (Poughkeepsie 1912); Kendall, P. M., 'Life, Letters, and Journals of Maria Mitchell' (Boston 1896); Mitchell, Henry, in 'Proceedings of the American Academy of Arts and Sciences' (Vol. XXV, Boston 1889-90); Whitney, M. W., 'In Memoriam' (Poughkeepsie 1889).

MITCHELL, Peter, Canadian statesman: b. Newcastle, New Brunswick, 4 Jan. 1824; d. Montreal, 25 Oct. 1899. He studied law and was admitted to the bar in 1848. Shipbuilding and other business pursuits soon engrossed his attention and he abandoned law, but in 1856 he entered political life as Liberal member in the provincial assembly of New Brunswick, and in 1860 was appointed to the legislative council, and five years later was appointed a life member of the legislative council and was premier 1865 to 1867. Mitchell was one of the foremost in the organization of the Canadian confederation, and was a delegate to the Charlottetown and Quebec conferences, and to London in 1866. He was appointed to the Canadian Senate in 1867, and resigned in 1873. He was Minister of Marine and Fisheries, 1867-74, and was chiefly instrumental in settling the negotiations between the United States and Canada over the Bering Sea fisheries. He sat in the House of Commons, 1874-78 and 1882-96. He purchased in 1885, and for some years edited, the *Montreal Herald*. In 1897 he was appointed inspector of fisheries for the Atlantic provinces. He was the author of a review of President Grant's message to Congress relative to the Canadian fisheries (1870).

MITCHELL, Samuel Alfred, American astronomer: b. Kingston, Ontario, Canada, 29 April 1874. He was graduated at Queen's University, Kingston, in 1894 and took his Ph.D. at Johns Hopkins in 1898. From 1899 to 1913 he was tutor, instructor and adjunct professor of astronomy at Columbia University. In the latter year he became professor of astronomy at the University of Virginia, and director of the McCormick Observatory there. He was a member of eclipse expeditions to George (1900); to Sumatra (1901); to Spain (1905); to Oregon (1918); to California (1923); to Connecticut (1925); and to Norway (1927). He frequently served as research associate at Yerkes Observatory, Chicago. His published works include 'Parallaxes of 260 Stars' (1921); 'Eclipses of the Sun' (1923); 'Parallaxes of 440 Stars' (1926). He is a member of numerous scientific bodies.

MITCHELL, Samuel Augustus, American geographer: b. Bristol, Conn., 30 March 1792; d. Philadelphia, 20 Dec. 1868. His early life was devoted to teaching in which he was very successful, but the inadequate treatment of geography by the textbooks then in use induced him to turn his attention to the making of satisfactory ones and he spent 40 years in Philadelphia in the preparation of textbooks on that subject. So general was their adoption that they reached a total sale of 400,000 annually.

Besides his geographical textbooks, of which there were 24, he edited a new edition of John James Audubon's 'Birds of America' and wrote 'General View of the World, Physical, Political, and Statistical' (1846), and 'New Traveller's Guide through the United States' (1850).

MITCHELL, Silas Weir, American physician, inventor of the "rest cure," poet and novelist: b. Philadelphia, 15 Feb. 1829; d. 4 Jan. 1914. He studied at the University of Pennsylvania, was graduated from Jefferson Medical College in 1850, entered practice in Philadelphia, during the Civil War was in charge of the Turner's Lane United States hospital (Philadelphia) for diseases and injuries of the nervous system, and subsequently was president of the Philadelphia College of Physicians. In his professional capacity he became known for his researches in connection with nervous diseases, and in physiology and toxicology. A bibliography of his publications would supply the titles of some 150 medical papers, recounting investigations of high scientific importance. To a wider degree, however, he is known through his literary work composed principally of poetry and fiction. He was elected to the American Academy of Arts and Sciences and the National Academy of Sciences, and was also made associate corresponding or honorary member of foreign scientific societies. His works in medical science include 'Researches on the Venom of the Rattle-snake' (1860); 'Gunshot Wounds and other Injuries of Nerves'; 'Reflex Paralysis' (1864); 'On Injuries of the Nerves and their Consequences' (1872); and 'Fat and Blood, and How to Make Them' (1877). Among his other writings are, in verse, 'The Hill of Stones' (1882); 'The Masque' (1887); 'The Psalm of Death' (1890), and 'The Wager' (1900); in fiction 'Roland Blake' (1884); 'Far in the Forest' (1888); 'A Madeira Party' (1895); 'Hugh Wynne' (1897); 'The Adventures of François' (1899); 'The Autobiography of a Quack' (1900); 'Circumstance' (1901); 'Collected Poems' (1896); 'Mémorial of Owen Jones' (1896); 'Constance Trescott' (1905); 'Doctor and Patient.' Consult Oberholtzer, E. P. 'Personal Memories of Weir Mitchell' (in the *Bookman*, Vol. XXXIX, New York 1914); the *Book News Monthly* (Vol. XXVI, Philadelphia 1907); Tucker, B. R., 'S. Weir Mitchell' (Boston 1914); Williams, Talcott, 'Dr. S. Weir Mitchell' (in the *Century Magazine*, Vol. LVII, New York 1898). Consult also 'Catalogue of the Scientific and Literary Works of S. Weir Mitchell' (Philadelphia 1894).

MITCHELL, Sir Thomas Livingston, Scottish explorer: b. Craigend, Stirlingshire, Scotland, 16 June 1792; d. Darling Point, Sydney, Australia, 5 Oct. 1855. He served in Wellington's army in the Peninsular War from 1808 until the end of the campaign, obtaining the rank of major in 1826, and was sent to survey the battlefields afterward. His map of the Lower Pyrenees is still valued. This led to his publishing 'Outlines of a System of Surveying for Geographical and Military Purposes' (1827) and the appointment of deputy surveyor-general of New South Wales (1828). Between 1831 and 1846 he made four exploring expeditions discovering the Peel, the Namoi, the Gwyder and other rivers and traced the

course of the Darling and the Glenelg. He was also the first to penetrate into the district that he named Australia Felix. His publications chiefly relate to his explorations: *Three Expeditions into the Interior of Eastern Australia*, 3 vols. (London 1838); *Journal of an Expedition into the Interior of Tropical Australia* (1848); *Australian Geography* (1850); and *The Lusiad Camoens Closely Translated* (1854).

MITCHELL, William, United States aviation officer who became famous as General "Billy" Mitchell: b. of American parents temporarily residing in Nice, France, Dec. 29, 1879; d. New York City, Feb. 19, 1936. He was the son of Senator John L. Mitchell, and after attending Racine (Wis.) College, was graduated from George Washington University in 1899. He enlisted at the outbreak of the Spanish-American War as a private and eventually attained the rank of brigadier general. He graduated from the Army Staff College in 1909.

After the United States entered the First World War he served as chief of Air Service, and, successively, the Zone of Advance, the 1st Corps, the First Army, and group of armies. Overseas he participated in 14 major engagements. After the war he was made director of military aviation, United States Army.

With a brilliant career behind him, and filled with enthusiasm for the airplane as a new instrument of warfare, he soon became an outspoken critic of the country's aviation policy, because of the government's failure to develop the air service. For months he figured in the newspaper headlines almost daily, and finally, because he had accused the high command of "incompetency, criminal negligence, and almost intentional administration of national defense," he was court-martialed for having violated the 6th Article of War, found guilty, and suspended for five years without pay or allowances. Later President Calvin Coolidge, after reviewing the sentence, upheld the suspension, but restored the allowances and granted the general one half of his monthly pay. Two weeks later, General Mitchell resigned from the army; and continued his criticisms of the national aviation policy. He anticipated and helped demonstrate the ability of airplanes to sink battleships, predicted that planes would soon fly at more than 50 miles an hour, and in 1923 prophesied that planes would one day fly regularly from China to San Francisco.

General Mitchell received the Distinguished Service Cross, the Distinguished Service Medal, the Croix de Guerre with five palms; was made Commander of the French Legion of Honor, Companion of the Order of St. Michael and St. George, and Commendatore S. S. Mauricio e Lazzaro; received the Medal for Merit in War; and also was made Grand Officer of the Crown of Italy. He published *Our Air Force* (1921); *Winged Defense* (1925); *Skyways* (1930); and numerous pamphlets and magazine articles. After he retired from the army he became a farmer and stock raiser in Virginia.

MITCHELL, city, Indiana, in Lawrence County; 69 miles north of Louisville, Ky., on the Chicago, Indianapolis and Louisville; and Baltimore and Ohio railroads. Situated in a diversified farming area it has a brisk trade in fruits, corn and wheat. It has a cement plant, garment works and creamery. Pop. (1950) 3,245.

MITCHELL, S. Dak., city and Davison County seat, altitude 1,320 feet; on the Chicago, Milwaukee, St. Paul and Pacific, and the Chicago, St. Paul, Minneapolis and Omaha railroads; by rail, 73 miles west of Sioux Falls; has a municipal airport, and a regular scheduled airline service. Surrounding the city is an agricultural region, and Mitchell's basic industry is the processing of foods. Besides the public and parochial schools, there is a business college, and the city is the seat of Dakota Wesleyan University, a Methodist institution that was opened in 1885. It has a school of music. Besides a Carnegie library the city has a children's home, two hospitals, and 16 churches; a city museum; a thirteen-hundred acre park system, a municipal band, and a city athletic field. Mitchell was platted in 1879, and incorporated in 1881, with a board of trustees as the administrative body. The present system of government by mayor and council began with city incorporation in 1883. The water supply system is municipally owned and operated. Pop. (1940) 10,633; (1950) 12,123.

MITCHILL, mitch'ill, **Samuel Latham**, American scientist: b. North Hempstead, L. I., Aug. 20, 1764; d. New York, Sept. 7, 1831. He was graduated M.D. at the University of Edinburgh in 1786, and in 1788 was a commissioner for treating with the Iroquois Indians for the purchase of land. In 1792 he was appointed professor of chemistry, natural history and philosophy in Columbia College, where he first introduced the system of nomenclature invented by Antoine L. Lavoisier. In 1797 he founded with Dr. Edward Miller and Elihu H. Smith the quarterly *Medical Repository*, the first scientific periodical published in the United States. In 1801 he became a representative in Congress, and in 1804 was chosen to the United States Senate. Though widely respected in his lifetime, he was occasionally satirized for certain eccentricities. He proposed to change the name of this country to "Fredonia," and wrote in 1804 *An Address to the Fredes, or People of the United States*. He was one of the early supporters of Robert Fulton, whom he accompanied in 1807 in the first steamboat journey on the Hudson. He was the author of *Observations on the Absorbent Tubes of Animal Bodies* (1787); *Nomenclature of the New Chemistry* (1794); *Life, Exploits, and Precepts of Tammany, the Famous Indian Chief*, a half historical, half fanciful address before the Tammany Society of New York (1795).

MITE, formerly a term applied to a very small coin worth about one mill. The name was used for a small coin current in Palestine in the time of Christ.

MITES AND TICKS, arthropods of the order Acari (or Acarina), including the smallest of all arachnids (class Arachnida), the most numerous and widely distributed, the most diversified in form and habits, are at the same time the most important from the medical and economic standpoint. The tiniest are gall mites one tenth of a millimeter long, the largest are female ticks engorged to nearly a full inch, and the average length for the whole group is probably only one millimeter. Among them are predators, herbivores and scavengers, and types that practice all grades

of symbiosis in roles from commensals to obligatory parasites. Much of the diversity in habits and body forms of mites may be attributed to the effects of the parasitic habit which has developed to different degrees along several distinct lines. The free living types, also numerous and varied, account for at least half of all mites and include many that, even though they may be found attached to insects, are not true parasites. Often only one stage lives as a parasite. A most unusual adaptation, for which no adequate explanation seems to have been advanced, is the possession of only three pairs of legs by the larval stage, whereas succeeding stages have the normal eight. An analogous six-legged stage is found in the Ricinulei, arachnids only distantly related to mites.

The ubiquitous mites occupy almost every conceivable habitat on the land areas of the world, occur in northern Greenland (83°N.) and other Arctic regions, and even are found on the Antarctic continent (77°S.). Common even at high altitudes, some live in the wool of mountain sheep at 15,000 feet above sea level. The land forms live in the soil and its detritus, on plants of all types, where many cause galls, spots and blemishes on the foliage, and on and in the bodies of both vertebrate and invertebrate hosts. *Acarapis woodi* inhabits the tracheal system of the domestic honeybee and is the causative agent of the well-known Isle of Wight disease which results in paralysis of the flight muscles. In the United States, *Locustacarus trachealis*, a strange species which retains only six legs in adults of both sexes, lives in the tracheae of grasshoppers, sucking the blood of the host through incisions in the tracheal wall and, when in numbers large enough to act as an obstruction, causing pathological changes in the vital organs. Others live in ant and termite nests, in the feathers of birds, in the tracheal passages of seals, in the lungs of monkeys, and in the skin of man. In favorable situations millions of individuals swarm within the limits of a few cubic inches. A large fauna lives in fresh waters and a modest number have become adapted for life in the seas.

The parasitic mites are of particular interest because of the annoyance and misery they deal out to man and his domestic animals. Some acarologists believe that an intensive survey would reveal that parasitic mites far outnumber the free living types. Furthermore some free living types seem even now to be becoming parasites. Many of our deadliest human diseases are transmitted by mites and ticks, and every year more species are being identified as important vectors. Furthermore, many are becoming established in new localities and bringing with them important diseases. Noteworthy is the fact that disease organisms (viruses, Rickettsiae, bacteria, protozoa, etc.) may be transferred casually from host to host, or may be a hereditary residue lying viable in dormant stages and then transmitted by an active, feeding stage to another victim at a much later date.

The small size of mites make them difficult subjects for study but admirable ones for dispersal. They float as aerial plankton at high altitudes, at 10,000 feet up and probably even higher, and are carried about by birds and flying insects. The term "phoresy" is applied to the habit of certain mites of clinging to the bodies of insects, notably the beetles, while they are transported by these active vehicles. The larva of *Uropoda*

glues itself to the host by means of an adhesive cord of excrement. The strange nymphal stage of cheese mites known as the hypopus is also concerned with distribution. After transforming into a mouthless, quiescent creature, it attaches itself by means of ventral suckers to an insect, usually a fly, and is carried to a favorable breeding place, where it again assumes the form of a normal nymph.

Structure.—The body of mites is typically saclike with the cephalothorax and abdomen broadly joined and intimately coalesced. Almost all evidence of the original segmentation is absent except in a few primitive forms. In some the posterior legs are virtually terminal, indicating that the abdominal segments have assumed a very different location in the animal. The cephalothorax bears one or several pairs of small, simple eyes on each side, but they may be absent. The normal six pairs of appendages are present but they are often much changed. The pedipalps, chelicerae, and accessory mouthparts are often formed into a distinct division called the beak or capitulum, which is sometimes completely retracted into a chamber known as the camerostoma. The mouthparts are adapted for piercing, sucking, biting and sawing. The legs are normally four pairs; but the first active stage is a six-legged larva. In *Locustacarus* the adults have only three pairs of legs; and in the Tetrapoli only two pairs are retained by all stages, including the adults. The body and appendages, in many hardened and grotesquely ornamented, are provided with setae of many types, often pointed, hooked, plumose, flattened, or modified into diverse forms.

Respiration is effected by breathing oxygen directly through the thin integument or by tubular tracheae which open through more or less distinct spiracles. Coxal glands opening on the cephalothorax, and Malpighian tubules opening into the gut are the excretory organs. The circulatory system is the usual open one of arachnids, consisting of a tubular heart and arteries which ramify and empty the blood into sinuses between the organs. Copulation is usually accomplished by direct apposition of the genital openings, which in typical arachnids open ventrally on the second abdominal somite in both sexes. The position is variable in mites even in the same species and in many the males have copulatory organs. That of the male *Demodex* is situated on the dorsal surface of the cephalothorax. The orifice of the female ticks is located far forward between the coxae in a position behind the mouth. Some water mites (Hydrachnidae) exhibit a curious mode of pairing analogous to that of the Ricinuleids. The third legs of the males are somewhat modified and used as hands to transfer the spermatophores to the genital opening of the female. Other members use the chelicerae in much the same way to effect the transfer as in the solpugids. In still another group of mites (Gamasidae) the pedipalp is used, a procedure analogous to that of spiders.

The development of mites is accompanied by a marked metamorphosis during which, depending on the group, five or even more distinct stages are undergone, each marked by the shedding of membranes. The major stages are egg, larva, nymph and adult. In general, oviparity is the rule but ovoviviparity is credited to some (Oribatidae) which retain the developing egg within the body until an advanced stage is reached. Some mite

develop parthenogenetically. The eggs may be few, laid singly or in small groups, but in some (the ticks) the oviposition is a lengthy routine during which hundreds or thousands are laid in one batch, after which the female dies. In many only a single egg is matured and laid before the chorion is developed over the succeeding one. After a few days the egg shell breaks and reveals a developing embryonic stage called the deutonym, from which later hatches a hexapod larva. The six-legged larval stage is an active one during which many species find a suitable host, attach and engorge, and then drop off to change into the next stage. There then follows a quiescent period during which the body of the nymph develops within the changed, engorged larva, and then the nymph appears. This, the first eight-legged stage which resembles the adult except for smaller size and sexual immaturity, is an active one which feeds before changing to the final sexually active adult stage. The adults are active and, in the parasitic forms, voracious types that again attach to the host to feed, during which copulation often takes place. The length of life of adult stages is ordinarily not longer than a month or so. However, many mites and ticks are extremely resistant to desiccation and starvation and, particularly in the nymphal stages, are able to withstand their effects for very long periods, as long as two or three years in ticks which ordinarily live a much shorter total life span.

The mites are most closely allied to the harvestmen (order Opiliones) and differ in their respective primitive forms principally in having the abdomen distinctly segmented, in the position of the quite similar chelicerae, and in numerous minor details. More distant relatives are other broad waisted arachnids, such as the scorpions and solpugids. The oldest fossil mites come from the Old Red Sandstone of Scotland, which is of Devonian Age. They also occur in the Carboniferous where all the other arachnids are also represented and are known from numerous examples in Baltic amber and a few other deposits of Oligocene age.

The Kinds of Mites.—It is not possible to mention here more than a few of the principal groups of mites, which are divided by recent students into hundreds of families assigned to six principal suborders. The suborder Notostigmata is represented by a small group of brightly colored primitive mites with well marked segmentation of the abdomen as in ancestral forms. Another small group is the suborder Holothyroidea, comprising some of the largest of known mites, often exceeding one fourth inch, known only from Papua.

Some of the most atypical of all are the gall mites of the suborder Tetrapi. These minute forms with elongate, annulate abdomens have only four legs in all stages and are responsible for galls on leaves of plants. These galls differ from those of insects in that there is an opening through which the young mites escape, whereas insect larvae are usually completely imprisoned.

The suborder Sarcoptiformes includes the beetle mites (Oribatidae), common, often shining black forms of little economic importance which live in soil detritus and feed on vegetable matter, and most of the parasitic atracheate mites (superfamily Sarcoptoidea). Most are parasitic during their whole life on the same host, where they infest the feathers, hairs or skin. The

feather mites (family Analgesidae) are small, flattened types which frequent the feathers of birds. Itch mites (Sarcoptidae) live on the hoofs of horses, producing a disease known as foot-mange, infest the head, eyes and ears of dogs and cats, cause a disease of chickens called scaly-leg, and are responsible for serious and widespread scab diseases of sheep, cattle and rabbits. The various scabies mites (genus *Sarcoptes*) infest many domestic animals and include among them the itch mite of man (*Sarcoptes scabiei*). They burrow into the skin, usually between the fingers and toes, and cause distressing symptoms, but they have become a rarity in the United States and some other countries. The cheese mites and their allies are for the most part free living but a few are parasitic, sometimes causing mysterious outbreaks of dermatitis in houses and factories. Species of *Tyroglyphus* may be found in cheeses, grains, sugar and hay and on occasion are responsible for conjunctivitis and various itches in those who handle these products. This suborder also includes the curious *Acarapis*, previously mentioned as causing the Isle of Wight disease of bees.

The suborder Trombidiformes is another tremendous assemblage of mites, including many that are free living but others of great biologic interest and pressing medical importance. The louse mite (*Pediculoides ventricosus*) is remarkable in that it acts freely either as predator, scavenger, or parasite during its life history. An important pest on corn and crops, it also produces severe skin eruptions on hands and arms of workers. The numerous red spider mites (family Tetranychidae) are among the greatest enemies of the gardener, attack tomatoes, cucumbers and similar crops, defoliate fruit trees, and do serious damage to grass and clover crops. One of them (*Bryobia pratensis*) often enters houses in the fall, much to the distress of the housewife. A relatively innocuous member of this subfamily is *Demodex folliculorum* which lives in the hair follicles of man and is said to be quite common in the blackheads which form on his face. An elongate creature with tapering abdomen, *Demodex*, is harmless in man and extremely rare in the United States. Related species are more important, and one causes the red mange of dogs, a serious dermatitis. Living in freshwater ponds and streams, often in great numbers, are the extremely varied and beautiful water mites (family Hydrachnidae), forms of which are gaily dressed in bright reds and greens and which swim through the water with the aid of long hairs on the legs. The larval forms are sometimes parasitic on the gills of mollusks but the predaceous adults feed largely on minute aquatic creatures. The less common water mites of the family Halacaridae live in the sea. Among the most pestiferous of all mites are the six-legged larval forms of the harvest mites (Trombididae) well known to Americans as redbugs or chiggers. These tiny creatures attack a great variety of small hosts, such as birds, rabbits, snakes, turtles, and similar creatures. They swarm in grassland in the moist hot tropics and cause violent itching and irritation when they attack man. *Eutrombicula akamushi* is the vector of a Rickettsia organism which causes a febrile disease, frequently fatal to man in Japan and over much of the Oriental region and the major Pacific islands. In the United States, *Eutrombicula alfreddugesi* is the offensive species and causes a severe dermatitis following

attachment to the skin by means of their hooked chelicerae. They do not burrow in as often believed but the effects of even temporary attachment is burning and intolerable itching. Effective repellents are now available as a prophylaxis.

The final suborder, the Parasitiformes, includes the generalized gamasid mites (group Parasitoidea) and the ticks (Ixodoidea). Among the former are two tropical rat mites (*Liponyssus bacoti*), an Egyptian species now widely distributed over the world and the United States, which frequently attacks man, and *Allodermanyssus sanguineus*, the vector of a recently described new febrile disease of the United States. Most important of all the mites from the standpoint of human health are the ticks. As a source of annoyance in tropical countries they rank with the red bugs because of their vast numbers and their persistence in crawling over the body of man. Although they do not often cause serious local injury, many are known to carry deadly diseases. All are ectoparasites which suck blood during their active life stages. The ticks of the family Argasidae, which lack dorsal shields and have the capitulum ventral, are long lived and lurk in the nests and habitats of their hosts, feeding intermittently and then retreating to a hiding place. The spinose ear-tick of the American Southwest infests the ears of horses and occasionally attacks man. Species of *Ornithodoros*, some of which are essentially human parasites, live in native huts and around camp sites and transmit spirochaetes which cause relapsing fevers in Africa and the Orient. The ticks of the family Ixodidae, which have a dorsal scutum and terminal capitulum, are specialized parasites which may be limited to a single host but more often use several different ones to complete their life history. They feed slowly and when engorged drop off the host to change into the next stage. Important diseases transmitted by Ixodid ticks are Texas fever of cattle and Rocky Mountain Spotted Fever, a serious and widespread Rickettsial disease of man.

WILLIS J. GERTSCH,
Associate Curator, Department of Insects and Spiders, The American Museum of Natural History.

MITFORD, John, English clergyman and writer, friend of Charles Lamb and Samuel Rogers: b. Aug. 13, 1781; d. Benhall, Suffolk, April 27, 1859. He graduated from Oriel College, Oxford in 1804, and five years later he took orders in the English church. He was the editor of, and contributor to, *Gentleman's Magazine* (1834-1850).

In 1814 he edited the first accurate edition of the *Poems of Thomas Gray, with Critical Notes, a Life of the Author, and an Essay on his Poetry* and in 1816, he embodied this material into two large volumes which contained important additions to the published letters of the poet.

MITFORD, mit'ford, Mary Russell, English writer: b. Alresford, Hampshire, England, Dec. 16, 1787; d. Swallowfield, near Reading, Berkshire, Jan. 10, 1855. Her education was obtained largely through her very wide reading. She won a lottery prize of £20,000 when three

years old, with which her spendthrift father built a house at Reading. Owing to his extravagance, the family had to move to a laborer's cottage, and she to earning by her pen. Her first published work was *Miscellaneous Poems* (1810). With the sketches *Our Village*, descriptive of English rural life (first appeared in *Lady's Magazine*, 1819; collected 1824, 1826, 1828, 1830, 1832), she may be said to have originated a branch of literature. Among her dramatic works, five in number, *Rienzi* (1828), was most successful; in America it became popular with Charlotte Cushman as Claudia. Included in her further writings are *Recollections of a Literary Life* (1852), and the works of fiction *Belford Regis* (1835) and *Atherton* (1854), the latter highly praised by Ruskin. Her correspondence (published 1870) has been by some ranked almost with her books. Consult the *Life* by L'Estrange (1870); id., *The Friends of Mary Mitford as Revealed in Letters from her Literary Correspondents* (1882); the correspondence with Boner and Ruskin, edited by Elizabeth Leveson (1915).

MITFORD, William, English historian: b. London, Feb. 10, 1744; d. Exbury, Feb. 10, 1827. He was educated at Oxford, and obtained a commission in the Hampshire militia, of which he became colonel. His early fondness for Greek led him to the study of Greek historians and he was induced, partly through the advice of Gibbon, a fellow-officer in the same regiment, to undertake a *History of Greece*. The first volume appeared in 1784, the fifth and last, bringing the narrative down to the death of Alexander the Great, in 1818. With considerable critical acumen and diligent research he elucidated many obscure points, and until the appearance of the works of Thirlwall and Grote, his history was considered of the highest authority. A strong prejudice against democracy leads him to speak of the Athenians as a horde of treacherous-miscreants, of Demosthenes as a malignant demagogue and of Philip as a perfect statesman and warrior. Mitford was professor of ancient history in the Royal Academy, and member of Parliament for three boroughs in succession: 1785-1818. Besides his principal work he published an *Essay on the Harmony of Language* (1774) and lesser works.

MITHRAS, mīth'ras, in Perso-Iranic divinity, first the god of the heavenly light and the lord of all countries, afterward the sun, or the genius of the sun, which was worshipped as a deity by the Persians, and at a later period also in Rome. Mithras stands as a mediator between Ormuzd and the world, and was involved in the struggle with Ahriman, the evil power. He is commonly represented as a handsome youth, wearing the Phrygian cap, tunic and cloak, and kneeling on a bull, into whose throat he is plunging the sacrificial knife. The bull is at the same time attacked by a dog, a serpent and a scorpion. As the monuments of this worship were destroyed during the Mohammedan conquests, knowledge of its doctrines and rites is necessarily vague and uncertain; but it had some remarkable resemblances to Christianity. The worship of Mithras was formally suppressed in the 4th century. In Germany many tokens of its former existence are still to be found, as the monuments at

Hedernheim, near Frankfort-on-the-Main, and other places.

• **MITHRIDATES** (mīth-rī-dā'tēz) **VI**, surnamed **EUPATOR**, and also styled commonly **THE GREAT**, king of Pontus: b. Sinope, 134 B.C.; d. Pantacapaëum, 63 B.C. He ruled from 121 B.C. until his death. He early entered on his career of conquest, which ultimately involved him in war with Rome. He subjugated the peoples on the northern shore of the Euxine (Black) Sea, attacked Cappadocia and Bithynia, and since these were allies of Rome, there encountered Roman opposition. After the death of Sulla, 78 B.C., Mithridates levied another army to expel the Romans from Asia. Being defeated by Lucullus, appointed consul 74 B.C., he was followed by the victorious Romans into his own states, and driven to seek refuge in Armenia, then ruled by Tigranes, who refused to deliver him up. Here Mithridates raised a third great army, and in 67 B.C. completely defeated the Romans; and, following up his success, rapidly recovered the larger part of his dominions. The Romans now invested Pompey with absolute power in the East, and by him, in 66 B.C., the forces of Mithridates were completely routed near the Euphrates. The king retired to Bosphorus (the Crimea), where his troops headed by his son Pharnaces, broke out in mutiny, and Mithridates killed himself. He was considered by Rome its most formidable enemy. See **POMPEY**; **SULLA**.

MITLA, mēt'lā ("the place of the dead"), Mexico, a village of the state of Oaxaca, on the Mixtecapan Plateau, 26 miles southeast of Oaxaca. It is celebrated for its extensive ancient ruins which comprise five great groups of temples, palaces, tombs and other edifices covering about 2,000 feet square. See **MEXICO—18**. *Architecture* (Valley of Oaxaca).

MITO, mē'tō, Japan, a town in the island of Hondo, seven miles from the east coast and 73 miles by rail northeast of Tokyo. It is a town of considerable antiquity. The manufactures include cloth, paper, for which it is famous, and cigarettes. Pop. 63,816.

MITO, *Doctrine of*, said to be the creed of the Mito school of Japan from the middle of the 17th century to the overthrow of absolute power in the 19th century. This doctrine rested on the revival of the old learning of Japan, the honoring of the emperor and the expulsion from the country of "the barbarians" or foreigners.

MITO, or **MYTHO**, French Indo-China. See **MYTHO**.

MITOSIS, or **KARYOKINESIS**, the process of indirect nuclear division of cells undergoing growth or beginning those changes in the egg which bring about the growth of an embryo. The first stages are characterized by a rearrangement of the nuclear network into a series of loops or V-shaped bodies. Meanwhile a minute body in the cytoplasm, or extranuclear cell contents, has divided into two, and the portions have arranged themselves at opposite poles, with the nucleus between them. Each of the two portions forms a starlike aggregation consisting of a centrosome with a radiating mass. The V-shaped bodies, or chromosomes, of the nucleus

arrange themselves with their open ends outward and their closed ends near the center, and they then separate along the central or equatorial plane, one half proceeding to each centrosome, with whose rays it becomes incorporated and is firmly held. The cell then becomes constricted between the centrosomes, and in each of the two portions a new nucleus is developed by a process essentially the reverse of that just described. The final result is the formation of two daughter cells out of the original mother cell, each of which contains an exact half of the essential chromatin elements not only in respect to equal quantities, but in respect to those qualities, chemical or other, which constitute the inheritable individuality of the organism. For fuller information see **CELL**; **EMBRYOLOGY**.

MITRA, mē'tra (Sanskrit, meaning friend), an Indian god of light, belonging to the Vedic period. Mitra is the Friend, the personification of Daylight, a bright being beloved of man. His name is coupled with that of Varuna, another bright being. The association between them is so close that they present themselves to the mind as an inseparable pair—Varuna-Mitra or Mitra-Varuna—who drive the same golden chariot and think the same thoughts. Together they are the keepers of the Cosmic Order and the Law of Righteousness, and together they watch the deeds and hearts of men, equally all seeing and all knowing. The sun is often called the eye of Mitra-Varuna as well as Varuna's alone; and Light is the chariot on which these two inseparable gods ride through space on their appointed path. They are also avengers and forgivers of sin. It is Mitra's particular business to wake men and call them to the duties of a new day. Only one hymn is addressed to Mitra alone. The general character of the hymns of the Rig-Veda is as follows: "Mitra and Varuna, you mount your chariot, which is golden when the dawn bursts forth and has iron poles at the setting of the sun; from thence you see what is boundless and what is limited, what is yonder and what is here." Varuna and Mitra are both Adityas, that is, sons of Aditi, who in consequence, is called "Mother of the Gods." She probably designates boundless space (*aditi*, space). Varuna and Mitra are, therefore, Sons of Boundless Space, Sons of Eternity, Sons of Beauty and Brightness, forgivers of sin, guardians of purity and truth, givers of health. They are thoroughly practical and beautiful deities. Mitra is identical with the Iranian Mithra, or Mithras, also a solar deity and the central figure of a special cult. See **MITHRAS**; **AVESTA**; and **VEDIC LITERATURE**.

MITRA, Rajendra Lala, Indian Orientalist: b. near Calcutta, Feb. 15, 1824; d. Calcutta, July 26, 1891. He came of the writer caste of Bengal and studied particularly Sanskrit and Persian. In 1846 he was made librarian of the Asiatic Society and devoted the rest of his life to this body, working as philological secretary, vice president and president from 1885. He became raja in 1888. Besides numerous contributions to the *Journal of the Asiatic Society* and a series of Sanskrit texts entitled *Bibliotheca indica*, he published three important works: *The Antiquities of Orissa* (2 vols., 1875 and 1880); *Bodh Gaya, The hermitage of Sakya Muni* (1878); and *Indo-Aryans*, dealing with the man-

ners and customs of the people of India from Vedic times (2 vols., 1881).

MITRAL VALVE. See **HEART, THE**.

MITRE, mē'trā, **Bartolomé**, Argentine soldier, politician and author: b. Buenos Aires, June 26, 1821; d. there, Jan. 19, 1906. He became the leader in the movement in which Buenos Aires proclaimed itself independent, Sept. 11, 1852, and was successively minister of the interior and of war in the Buenos Aires government. The force commanded by him was defeated by Justo José Urquiza (q.v.) at Capeda, Oct. 23, 1859, but he defeated Urquiza at Pavón on Sept. 11, 1861. In 1862 he was elected president of Argentina for a six-year term. During 1865-70, in alliance with Brazil and Uruguay, he waged war successfully against Paraguay. He founded the newspaper *La Nación*, and wrote *Historia de Belgrano* (1857) and *Historia de San Martín* (1884).

MITRE, in ecclesiastics, a sacerdotal head-dress worn by bishops and certain other church dignitaries on solemn occasions, being a sort of cap pointed and cleft at top. Three kinds are worn in the Roman Catholic Church, namely, the precious mitre, of gold or silver and ornamented with jewels; the *mitra auriphrygiata* of gold cloth, without jewels (except pearls); and *mitra simplex* or plain mitre, of white silk or linen. Bishops and mitred abbots receive their mitres from the bishop who consecrates them. In the Church of England mitres fell into gradual disuse after the Reformation, disappearing in the 18th century, but were revived by some Anglican bishops after 1885. The English form is smaller than that worn by bishops of the Roman Catholic Church. The mitre of bishops of the Greek Church is a dome-shaped crown. See **COSTUME, ECCLESIASTICAL**.

MITRE SHELL, the shell of a gastropod mollusk of the genus *Mitra* and family *Mitridae*, closely allied to the *Muricidae*, so called because of its resemblance in form to a bishop's mitre. The shells are thick, somewhat fusiform, with the spire very high and acute, and a small aperture and operculum. The genus is a very large one, comprising several hundred species mostly from shallow, tropical seas and especially abundant in the Malayan region. *Mitra episcopalis* is abundant on the tidal flats of the Philippine Islands. During the day, especially at low water, they burrow beneath stones or hide in crevices, but are active at night. They secrete a purple fluid having a nauseating odor and act as scavengers.

MITROVICA, mē'trō-vêt-sā, or **SREM-SKA**, srēm'skā, Yugoslavia, a town in the Federated Republic of Croatia, on the river Sava in the county of Syrmia, 43 miles west of Belgrade. Roman remains have been discovered in the neighborhood and the city occupies the site of Sirmium, or Sirmium, the chief city of lower Pannonia under the Roman rule. The Emperor Probus (232-282) was born and buried at Sirmium; and here, according to some authorities, the noble emperor, Marcus Aurelius (121-180), died. Ecclesiastical councils of importance met in 351, 357 and 358 at Sirmium, which became an episcopal see in 305. In 1773 it was united

with the diocese of Bosnia. The Huns sacked Sirmium in 441 and the Turks ravaged Mitrovitz completely in 1396 and 1521, destroying all the old buildings. A few ruins of the ancient Roman city are still to be seen. The countryside produces fruit, wine and grain, and the industries are chiefly the culture of silk worms and tanning leather. Pop. (1931) 13,840.

MITSCHER, mīch'ēr, **Marc Andrew**, United States naval officer: b. Hillsboro, Wis., Jan. 26, 1887; d. Norfolk, Va., Feb. 3, 1947. Graduating at the United States Naval Academy in 1910, he advanced through the grades to admiral in December 1945. During World War I he served aboard the *Huntingdon* on convoy duty, and then returned to flying, which he had already chosen for his career. In 1913, in the "bamboo-and-wire crate" era of aviation, he had taken his flight training at the Naval Air Station, Pensacola, Fla., being the 33d pilot to receive his wings. After the war he held naval air station commands at Rockaway, Long Island, N.Y., and Miami, Fla., and when the first American carrier, the U.S.S. *Saratoga*, was commissioned in 1928, he became head of her air personnel. Thereafter he alternated between sea-air duty and service in the navy's Bureau of Aeronautics, and in the fall of 1941 he was appointed to command the U.S.S. *Hornet*, newest of the American carriers. His vessel, in April 1942, conveyed the army fliers of Gen. James Doolittle to within 800 nautical miles of Japan, whence they took off for the first bombing of Tokyo, and two months later it fought in the Battle of Midway. In April 1943 he was named air commander on Guadalcanal, and for his achievements in that post he was awarded the Distinguished Service Medal. Appointed to command of Task Force 58 early in 1944, his carriers and their escorts covered the invasion of the Marianas in January, and attacked the enemy bases at Truk on Feb. 16-17 and at Tinian and Saipan, in the Marianas, on Feb. 23, 1944. During June 19-20 Task Force 58, by this time known as the First Carrier Task Force, took part in the Battle of the Philippine Sea, and through Oct. 20-27, as part of Admiral William Frederick Halsey's Third Fleet, it supported the landings in Leyte Gulf; among other damage inflicted during these latter operations, his planes sank the Japanese battleship *Musashi*, one of the two most powerful in the enemy navy. On March 19, 1945, Mitscher's aircraft attacked Kobe and Kure, in Japan itself, as well as naval vessels in the Inland Sea, and thereafter he was almost constantly in action against the enemy. His flagship, the U.S.S. *Bunker Hill*, was severely damaged by dive bombers off Okinawa on May 11, 373 crew members being killed and 264 wounded; he escaped uninjured and transferred his flag to another vessel when the *Bunker Hill* returned to the United States for repairs. He served as deputy chief of naval operations for air from July to December of 1945, when he was assigned to command of the Eighth Fleet.

MITSCHERLICH, mīch'ēr-lik, **Eilhardt**, German chemist: b. Neuende, near Jever, Oldenburg, Jan. 7, 1794; d. Schönberg, near Berlin, Aug. 28, 1863. He was the son of a clergyman and nephew of the celebrated scholar, Christophe Wilhelm Mitscherlich (1760-1854). Going to Heidelberg in 1811, he devoted him-

self to philology and more particularly to Persian. In 1813 he went to Paris, hoping to obtain permission to join the embassy which Napoleon I was about to send to Persia. Political changes frustrated this plan, and Mitscherlich determined to study medicine in order to have the privileges accorded to physicians traveling in the East. For this purpose he went to Göttingen, and while there compiled a history of Persia from manuscripts in the university library. Entitled *Mirchondi historia Thaheridarum historicis nostris huiusque incognitorum Persiae principum*, it was published in 1814 in both Latin and Persian.

While studying medicine at Göttingen, his attention was attracted to geology, chemistry, and physics, and he moved to Berlin in 1818 to work in the laboratory of the botanist Heinrich Friedrich Link. There his researches led him, in 1819, to the discovery of the principle of isomorphism (q.v.). He studied with Jöns Jakob Berzelius in Stockholm, Sweden, in 1820-1821 and then returned to Berlin to lecture in chemistry at the university. He later discovered the double crystalline form of sulphur, one of the first observed cases of dimorphism. His investigations in the production of artificial minerals, his paper on benzene and the formation of ether, and his discovery of permanganic and selenic acids were also important. His principal work is *Lehrbuch der Chemie* (2 vols., 1829-1830; 4th ed., 1844-1847). Shortly after his death in 1863, many of his previously unpublished notes and papers were recorded in the *Memoirs* of the Berlin Academy.

MITSUI, mē-tsōō-ē, and **MITSUBISHI**, mē-tsōō-bē-shē, Japanese financial and industrial combines. Before and during World War II, these two industrial trusts were the first and second respectively of the *zaibatsu*, the powerful, centralized Japanese commercial investment houses. Though in competition with each other and with other *zaibatsu* concerns, they collectively exercised a considerable measure of control over the economic life of Japan and were largely responsible for the country's quick rise to a position of competitive strength in the world market after the Meiji Restoration of 1868. They also provided the financial backbone of the nation's military might in the 1930's and 1940's.

The Mitsui organization, founded by Takatoshi Mitsui in the 17th century, had a long tradition of successful commercial and banking activity behind it when the government, attempting to industrialize Japan in the 1870's, began to shower the firm with subsidies, loans, and special privileges. The company expanded and prospered to the point at which its net worth was conservatively estimated in 1940 at a billion yen, but it remained primarily a family or clan-owned concern. Though in its later development it owed much to a succession of managers developed within the organization, many of these were absorbed into the Mitsui family by marriage or by adoption.

The *zaibatsu* firms were often able to influence the government and were sometimes represented in the cabinet itself. In 1932 the Mitsubishi concern aided financially in the creation of the Manchukuo government and was rewarded with lucrative business concessions in the conquered territories. There were close ties between the Mitsui concern and the Seiyukai Party, and between the house of Mitsubishi and the only other major political party, the Minseito. After World

War II, the Allies ordered the dissolution of all the *zaibatsu* concerns in an effort to democratize the control and ownership of Japanese economic resources. In August 1955, however, a revival of the parent Mitsui Bussan Co., Ltd. was brought about by a merger of two of its most powerful subsidiaries.

MITTAG-LEFFLER, mīt'täg lef'lēr, **Magnus Gösta**, Swedish mathematician: b. Stockholm, Sweden, March 16, 1846; d. Djursholm, near Stockholm, July 7, 1927. From 1877 to 1881 he was professor of mathematics in Helsingfors (now Helsinki), Finland, and then went to the University of Stockholm where he taught mathematics until 1911, serving as rector of the university in 1886, 1891, and 1893. Shortly after his arrival in Stockholm he founded the journal *Acta Mathematica*, which became internationally known. In 1916 he and his wife founded a mathematical library at Uppsala. Among his contributions to mathematical theory is the theorem, known by his name, on the one-valued function. See also **COMPLEX VARIABLE—Weierstrass's and Mittag-Leffler's Theorems**.

MITTEN, mīt'n, **Thomas Eugene**, American business executive: b. Brighton, Sussex, England, March 31, 1864; d. near Milford, Pa., Oct. 1, 1929. In 1877 he left England with his parents, who settled near Goodland, Ind. After working for several railroads, he began his connection with the street-railway business in 1896, first as an assistant superintendent at Milwaukee, Wis. By 1905 he was president of the Chicago City Railway Company, resigning in 1911 to become president of the Philadelphia Rapid Transit Company. There he established a cooperative plan which gave his employees a voice in all matters from general policy to wages and working conditions. He resigned as president in 1923, serving as chairman of the board until 1929. In the latter year the mayor of the city ordered an audit of the company's books because of its failure to submit annual reports to the city comptroller. This study showed that the company had incurred unjustifiably heavy expenses, and the comptroller filed suit on Dec. 1, 1929, for a financial accounting. Two months earlier, however, Mitten had drowned in a pond on his estate. In 1931 his company was ordered into receivership, and his management severely condemned.

MITTERMAIER, mīt'ēr-mī-ēr, **Karl Joseph Anton**, German jurist: b. Munich, Germany, Aug. 5, 1787; d. Heidelberg, Aug. 28, 1867. He was educated at the universities of Landeshut and Heidelberg. After being appointed professor at Landeshut (1811) and Bonn (1819), he went to Heidelberg in 1821 as professor of law and jurisprudence, a post he held for the rest of his life. His greatest work is a complete manual of criminal law, *Das deutsche Strafverfahren in der Fortbildung durch Gerichtsgebrauch und Partikulargesetzbücher* (1827). He also published a number of other books on important questions relating to jurisprudence, trial by jury, and the penal code, many of which were translated into other languages. He was a member of the Baden legislature from 1831, and for a time president of its lower chamber. He was also president of the Vorparlament at Frankfurt am Main in 1848, and a prominent member of the ensuing Frankfurt Assembly.

MITTIMUS, mīt'i-mūs (Lat. we send), a written warrant issued after a criminal conviction by a court or magistrate, directing a proper officer to convey the body of a prisoner to jail, and ordering the jailer to keep the individual in custody until legal provision is made for his release.

MITTWEIDA, mīt-vi'dā, town, eastern Germany, in Saxony, 11 miles north-northeast of Chemnitz and 34 miles south-southeast of Leipzig, on the river Zschopau. It manufactures a wide range of products, including paper and cotton, machines, precision instruments, glass, clothing, cigars, and leather. The town has a fine 15th century church, now Protestant. Pop. (1946) 22,794.

MITYLENE. See LESBOS.

MITZVAH, mits'vā, a Jewish religious commandment; also, more loosely, a good deed. The Torah contains over 600 *mitzvot*, both positive and negative. Their varying importance and number were established by Maimonides (q.v.) and other scholars and rabbis.

MIVART, mi'vart, St. George Jackson, English biologist: b. London, England, Nov. 30, 1827; d. there, April 1, 1900. A prosperous hotelkeeper's son, he was educated at Harrow and King's College, London. Having been converted to the Roman Catholic Church in 1844, he was barred from attending Oxford, and received his higher academic training at St. Mary's College, Oscott. In 1851 he was called to the bar at Lincoln's Inn, but the possession of ample means enabled him to gratify his taste for natural history. He was appointed lecturer in comparative anatomy at St. Mary's Hospital medical school in 1862, and from 1874 until 1877 was professor of biology at University College, a Roman Catholic institution which functioned briefly in Kensington, London. On the invitation of the Belgian episcopate he served from 1890 to 1893 as professor of the philosophy of natural history in the University of Louvain. He was vice president of the Zoological Society twice, and secretary and vice president of the Linnaean Society. In 1876 Pope Pius IX awarded him a Ph.D.

Mivart's scientific specialties were the insectivora and carnivora, but he was drawn into controversy by the warfare raging over the evolutionary theories of Charles R. Darwin, a struggle which, as a Catholic, he felt acutely. In *The Genesis of Species* (1871), he admitted organic evolution, but argued against Darwin's theory of natural selection and tried to explain the production of new species as due to an innate plastic power of "individuation"; he also rigidly differentiated between human and animal mental faculties. Gradually his views estranged him from Darwin and Thomas Huxley, while his articles on religion and science, between which he had been anxious to play the role of mediator, brought the disfavor of his religious superiors. Articles by Mivart appearing in 1892 and 1893 were placed on the Index; further magazine articles appearing in January 1900 resulted in his excommunication by Cardinal Herbert Vaughan on Jan. 18, 1900. He died shortly thereafter, unreconciled to the church; but in 1904, persuaded that his final illness had unbalanced his judgment, Catholic authorities allowed Mivart's reburial in consecrated ground. Mivart's evolutionary stand is

summed up in *Lessons from Nature* (1876) and *Contemporary Evolution* (1876); his greatest single monograph is probably *The Cat: an Introduction to the Study of Backboned Animals, especially Mammals* (1881).

MIWOK. See MOQUELUMNAN.

MIXCOATL, mēks'kō-ā-t'l, in Aztec mythology, the Cloud Serpent, a star god and the god of the hunt; sometimes also identified with the god of war (Camaxtli), and the god of the wind (Tezcatlipoca). As Camaxtli, he was counted among the four gods who made the world. He created fire from sticks shortly before the creation of man. At the feast of Quecholli, an annual fall festival in his honor, a ceremonial hunt was conducted. It is possible his name was suggested by the Milky Way, but his star was a morning star, usually the planet Venus.

MIXE, mē'hā, a tribe of Mexican Indians dwelling on the Tehuantepec Isthmus, southern Mexico. They speak the Zoquean language. The Mixe were conquered by Pedro de Alvarado in 1521-1524 and proselytized by missionaries from 1526; however, they remained religious conservatives until very recent times. They are good farmers, and their women are capable weavers and potters. In 1940 there were 51,261 Mixe, including bilinguals; in 1950 there remained 21,005 who spoke only Zoquean.

MIXED MARRIAGE, in *theology*, a marriage between a Catholic and Protestant, or, more loosely, any non-Catholic. Anglicans also employ the term. The Roman Catholic Church insists that the non-Catholic partner agree in writing before the marriage that the worship of the Catholic spouse shall not be interfered with; that children be reared as Catholics; and that no non-Catholic wedding ceremony be performed. On acceptance of these conditions, and the granting of a dispensation, a valid ceremony may be performed by a priest.

In *American law* mixed marriage means marriage of a Caucasian to a person of designated colored race or races. Such marriages were in 1955 illegal in 29 states, in some of which these laws were reinforced by criminal sanctions. Judges in state courts generally sustained anti-miscegenation laws against challenges as to their constitutionality.

MIXED PROPERTY, neither real property such as a house and land, nor personal property such as clothing, but having the nature of both. Heirlooms, house keys, tombs, and title deeds, among other articles, are in law mixed property.

MIXITE, mīk'sit, in mineralogy, a green-to-whitish basic copper bismuth arsenate, named for A. Mixa, inspector of mines in Bohemia. Chemically it is $\text{Cu}_2\text{O} \cdot \text{As}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ with 13 per cent Bi_2O_3 .

MIXODECTES, mīk-sō-dēk'tēs, in paleontology, a genus of insectivores with very large incisors analogous to those of rodents, found in the Paleocene and Eocene of North America. It is the type of the family Mixodectidae.

MIXOSAURUS, mīk-sō-sō'rūs, a genus of

small fish-lizards (*Ichthyopterygia*) from the Triassic formations of Europe, differing from typical ichthyosaurs by their fewer teeth and some minor characters.

MIXTEC, mīs'tēk, or **MISTEK** ("cloud people"), an Indian people of southwestern Mexico inhabiting Oaxaca and part of Guerrero. They comprise one of the most important Indian groups of that country. Prior to the arrival of the Toltecs (q.v.) on the plateau of central Mexico in the late 7th century A.D., the Mixtec and Olmec appear to have been the representatives of the Highland culture. About the year 900 the Mixtec struck southward into the valley of Oaxaca and seized from the Zapotec their towns of Monte Alban and Mitla. This aggression initiated a period of warfare between the two peoples which continued until the end of the 15th century when they temporarily united in a campaign against the Aztecs. That war terminating successfully for the allies, they again became enemies, the Zapotec forming an alliance with the Aztec. In the early 16th century the Zapotec king concluded an alliance with the Spaniards of Cortés; but the Mixtec fought the white invaders until subdued by Pedro de Alvarado. The modern Mixtec are highly skilled in agriculture and the simpler arts. They are noted for their pottery and textiles.

MIXTURE (from the Latin *mixtura*), a product of mixing, that is, the amalgamation of different ingredients mutually diffused through one another. It also means the action of becoming mixed such as a mixing or blending of races. Mixture is, moreover, used to denote a preparation for medicinal purposes and in pharmacy is applied to potions of liquid medicine. Mixture is also used to denote "type-setting that calls for the use of two or more distinct faces, or faces and bodies of type." Mixture is the opposite of solution.

MIXTURE, an organ stop. It is ordinarily furnished with from three to six small metallic pipes to each key and is compounded of the higher sounding and therefore shorter members of the foundation and nutation classes of stops, combined or mixed and arranged to draw together as in practice they are seldom required to be used separately. "The mixture," writes an authority, "represents or corroborates the higher consonant harmonic sounds suggested by nature, and in the bass produces tones to the third or fourth octave above the major or chief foundation tone. As the musical scale ascends, the higher harmonics become weak and inaudible to the ear; hence in a mixture stop it is customary to discontinue the higher ranks as they ascend, one or more at a time, and insert in lieu a rank of a lower tone than was previously in the stop but appearing as a separate stop." This alteration is called a "break."

MIYAKO, mē-yā'kō, city, Japan, in northern Honshu, Iwate prefecture, 45 miles east of Morioka. A fishing port on the Pacific coast, it is a shipyard and lumbering center. Pop. (1947) 36,715.

MIZAR, mī'zār, the second magnitude star ζ in the constellation of Ursa Major (q.v.). Probably the first double star to be discovered (1650), Mizar has the fainter Alcor (q.v.) as companion. E. C. Pickering showed in 1889 that Mizar itself

is a so-called spectroscopic binary, a phenomenon deduced from its alternate spectral lines. Later on it was established (1908) that Alcor and the close companion of Mizar are also spectroscopic binaries.

MIZON, mē-zôn', **Louis Alexandre Antoine**, French sailor, explorer and colonial administrator: b. Paris, France, 1853; d. at sea in the Indian Ocean, 1899. A naval officer, from 1880 to 1883 he helped Savorgnan de Brazza in his explorations of the French Congo. In 1890 he resigned his commission and devoted himself to the exploration of Equatorial Africa, backed by the Committee of French Africa. He made two expeditions up the Niger and its chief tributary, the Benue (Benoue) River (1890-1892 and 1893). In the course of his second expedition his promotion of French commercial interests in the Niger country evoked British jealousy, especially after he had negotiated a treaty with the sultan of Hamarua. Great Britain thereupon declared Hamarua a British protectorate and forced Mizon's recall. He then entered the colonial service, served as resident at Majunga in Madagascar, administrator of Mayotte, one of the Comoro Islands, and had just been appointed governor of Jibuti in French Somaliland when he died at sea. He published *Cartes du fleuve Ogôoué* (1886).

MIZPAH, mīz'pā, or **MIZPEH**, the name of several places in Palestine. The word signifies a high place or lookout mentioned in the Bible. Mizpeh of Gilead (Genesis 36:45) marks the site of the pillar and heap of stones put up by Jacob and his brethren in the mountains of Gilead in token of God being a witness to the covenant made between him and Laban. The "Mizpah ring" takes its name from this episode (see verse 49). The site is still pointed out with its group of rough stone monuments in the village of Sūf. —The Mizpeh of Benjamin (Joshua 18:26ff.) lay north of Jerusalem on an unknown site. —That of Judah (Joshua 15:38) stood north of Hebron and 20 miles south of Jerusalem. Nothing is positively known of the Mizpeh of Moab (1 Samuel 22:3).

MJOSA, myū-sā, **Lake** (Nor. Mjøsa), Norway, in the southeastern part of the country in the Gudbrandsdal. Norway's largest lake, with an area of about 141 square miles in Opland and Hedmark counties, it has a length of 65 miles and a width of from one to nine miles. Its greatest depth is 1,435 feet. It contains the small island of Helgoy. Chief towns on its shores are Lillehammer, Gjøvik, and Hamar. The Lagen River flows into it from the north. Its outlet is the 25-mile Vorma River, an affluent of the Glomma which empties into the Skagerrak.

MLADA BOLESLAV, mlā'dā bō'lēs-lāf (Ger. JUNGBOUNZLAU), city, Czechoslovakia, in northern Bohemia on the Jizera River, 25 miles south-southwest of Liberec. The city has important manufactures of automobiles, electrical parts, and machines. There are also distilleries, textile mills, and soap and candle factories. The cathedral is of 15th century construction and there is a fine 18th century baroque church. The town has a museum and its old castle is now used as a barracks. The United Brethren (q.v.) at one time held their assemblies here. Pop. (1947) 19,573.

MLAVA, mlā'vā, river, Yugoslavia, in eastern Serbia. It rises in the Crni Vrh Mountain

near Zagubica and flows about 60 miles north-northwest past Petrovac, entering an arm of the Danube north of Kostolac.

MLAWA, mwá'vá (Pol. *MŁAWA*), town, Poland, in Warszawa Province, northeast central Poland, 65 miles north-northwest of Warsaw. It has manufactures of cement, candy, and thread. Founded in 1429, it had become a wealthy city by the mid-17th century when, like so many other Polish cities, it was devastated by the Swedish invasion. Occupied by the Germans in both world wars, during World War II it was under East Prussia's administration and was called Mielau. Pop. (1946) 13,817.

MLJET, 'm-lyět (Ital. *MELEDA*, ancient *MELITA*), island, Yugoslavia, off the Dalmatian coast and in the Adriatic Sea, about 65 miles southeast of Split. Narrow and mountainous, it stretches for about 25 miles and covers an area of 38 square miles. It is believed by some to be identical with the Melita on which St. Paul was shipwrecked, though he probably was stranded on Malta.

MNASON OF CYPRUS, mentioned in Acts 21:16 as one who entertained Paul and his companions on their journey from Caesarea to Jerusalem. The Greek admits of two constructions to the passage rendered in the King James version of the Bible as "and brought with them one Mnason of Cyprus, an old disciple, with whom we should lodge." It may mean "brought with them one Mnason," or "bringing us to Mnason." Probably the home of this "old disciple" was in some village on the road between Caesarea and Jerusalem, and the distance of 60 or 70 miles made it convenient to break the journey there.

MNEME, nē'mē (Gr. *Μνήμη*, Memory), in Greek mythology the goddess of Memory and one of the three muses worshipped in early times on Mount Helicon in Boeotia, her sister muses being Aoide (Song) and Melete (Meditation). Later mythology increased the number of the muses to seven, and then to nine.

MNEMONICS, nē-mōn'iks, a system of artificial aids for assisting the memory. Such methods have been in use for many years. They consist in the main of some mechanical scheme or framework which, by association, is linked with what one desires to memorize. One of the oldest forms of verbal mnemonics is contained in the familiar lines, "Thirty days hath September, April, June and November"; and many similar devices are known. The medical student has an unlimited number of mnemonic aids whereby to remember the names of the muscles, to call to mind the relation of important viscera and to determine accurately the order of the cranial nerves. Students of logic have for years made use of mnemotechnic devices to remember the parts of the syllogism. (See *Logic*.) Some of these devices are based on topical association, whereas others depend on number and letter relations, and a great many which have been in vogue in recent years are based upon sound and rhyme relations. A general criticism that can be made of most of these memory-schemes is that the processes are purely mechanical, and that one of the fundamental features in memory, that is, memorizing for the sake of idea-relation, is given up for the sake of word-relation. For certain classes of

students and for certain lines of work these mechanical schemes may be of much service; for salesmen, for instance, who need to bear in mind immense quantities of goods with their wholesale retail and discount prices. But as a process of general culture, improving mind-facilities, so called, mnemotechnics are mechanical. See also *MEMORY AND ITS DISORDERS*.

MNEMOSYNE, nē-mōs'ī-nē, in Greek mythology, the goddess of memory; the mother of the nine muses of Zeus. She was a daughter of Uranus.

MNESICLES, nē'sī-klēz, Athenian artist of the age of Pericles. He was the architect of the gate-porches, called "Propylaea," to the Acropolis which required five years for their construction (437-433 B.C.). Attic legend tells that he fell from the top of the Propylaea and was mortally injured. That night in a dream Athena came to Pericles and showed him an herb which would cure his artist; and the following day Mnesicles was restored to health.

MNESITHEUS, Athenian physician, probably of the 4th century B.C. Very little is known of him, but Galen and other early physicians often speak of him in praise. The comic poet Alexis quotes him.

MNESTER, celebrated Roman pantomime actor; d. 48 A.D. He attained his reputation as a mime in the reigns of Caligula and Claudius. When he failed to respond to the advances Messalina she complained to Claudius that he had disobeyed her orders. The emperor had him flogged, and sternly commanded that he never again disobey the empress. Subsequently charged with participating in Messalina's orgies, he vainly pleaded that he had only obeyed the imperial command. He was executed.

MNEUIS, or **MNEVIS**, the name of Egypt's sacred bull worshipped at Heliopolis in the temple of Ra. His cult closely resembled that of Apis at Memphis where both cults were combined in the temple.

MNICHOVO HRADISTE, 'm-nyí'ko-vo hrá'dyish-tyě, town, Czechoslovakia, in northern Bohemia, nine miles north-northeast of Mladá Boleslav, on the left bank of the Jizera River. Its industries include manufactures of footwear and textiles. Here the convention of Munchengrätz met on Sept. 28, 1833, and representatives of Austria, Prussia and Russia agreed to guarantee the integrity of the Turkish Empire. During the Austro-Prussian War of 1866 it was the scene of a Prussian victory over the allied Austrians and Saxons on June 28, 1866. Pop. (1947) 3,733.

MOA, one of a race of extinct ratite flightless birds of New Zealand, forming the family Dinornithidae and composed of several genera (see *DINORNITHES*) ranked between the apteryx and the epiornis. They had comparatively small heads, small eyes, bills of varied form, great legs, wings almost or quite wanting, and the head and neck bare. The feathers of the body were rounded, loose in part, downy, with great aftershafts. Some of the feathers were black with red-brown bases and white, others blackish brown or yellowish. They varied in size from

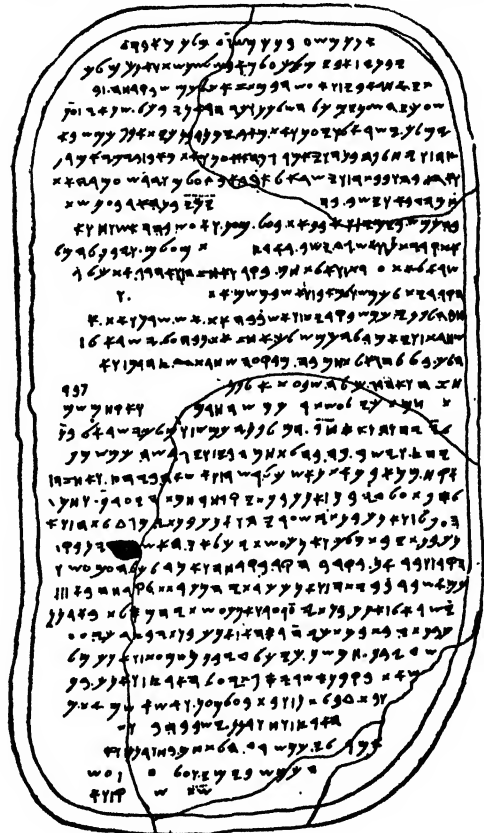

hat of a turkey (*Anomalopteryx parva*) so that of the huge *Dinornis robustus*, 12 feet in height. The remains of these birds are found in dunes, caves and places where the aborigines had fed upon their flesh. Not only bones, but pieces of skin, ligaments, feathers and eggs have been recovered. It is probable, indeed, that these birds became extinct only four or five centuries ago. The Maori traditions recount the wars of extermination which their early ancestors waged against the moa; and the natives profess to show the spot where the last one was killed. Clearer traditions say that the habits of the birds were sluggish, but their disposition fierce. They lived in pairs, fed upon green shoots and fern roots and made rude nests on the ground. Their anatomy was elaborately described in a memoir by Sir Richard Owen, *Extinct Birds of New Zealand* (London 1879), and a general account of them may be found in Alfred Newton's *Diction-ary of Birds* (London 1896); and Lionel Roth-child's *Extinct Birds* (London 1907).

MOAB, mō'āb, the name of an ancient Semitic people who occupied a rugged tableland between the Dead Sea and the Arabian desert, about 3,000 feet above sea level, now forming southwestern part of the Hashemite Kingdom of the Jordan. Their land was also called Moab. The Dead Sea and the Jordan River formed its boundary on the west, while its other boundaries varied with the successes or defeats of the Moabites in wars with other nations. The "plains of Moab" spoken of in the Bible (Numbers 22:1) are the hot plains of the Jordan valley. The origin and meaning of the name is not known. Some authorities accept Moab, the son of Lot, as the ancestor of the Moabites (Genesis 19:37); others maintain that the expression "children of Lot" (Deuteronomy 2:9, 19) comes from the earliest known name of the land, which as Lotan, or Lot. Some authorities believe the Moabites settled there as early as the 13th century B.C. They had reached a high degree of civilization by the 9th century B.C.

The Moabites were a pastoral people and their country was noted for its rich pasturage and its fine wine. The institution of monarchy was established among them much earlier than among the Israelites, but their language, religion, and customs were similar to those of the Israelites, who regarded them as kinsmen. Their supreme god was Chemosh, who held among them much the same position as Jehovah among the Hebrews. Moab was for a time tributary to Israel under David and Solomon, but regained its independence either during the latter part of Solomon's reign or during the subsequent reign of Rehoboam. Later the Moabites paid tribute to the Assyrians. They were eventually invaded by tribes from the Arabian desert and their national existence came to an end in the 6th century B.C.

MOAB, town, Utah, county seat of Grand County, on the Colorado River; altitude 4,000 feet; 100 miles southeast of Price. It is on federal and state highways. The town is an important trading center for the livestock, fruit, and agricultural products raised in the area. Vanadium and uranium mines are nearby. To the north is the Arches National Monument and to the east La Sal National Forest, both tourist attractions. Pop. (1950) 1,274.

MOABITE STONE, a block of black basalt, about 3 feet 8½ inches high, and 2 feet 3½ inches wide, and 1 foot 1¾ inches thick, with rounded top but square base, on which there is an inscription of 34 lines in Hebrew-Phoenician characters, discovered in 1868 by the Reverend F. A. Klein at Dhiban, the Dibon of ancient Moab, just north of the river Arnon. An attempt made to purchase it led to a quarrel among the Arabs of the district, who thought to make more money out of it by selling it in pieces, and the stone was destroyed partially by being heated and then by throwing water upon it, which caused it to break into three large and several small pieces. The larger pieces were secured for the Louvre by Charles Clermont-Ganneau, a French Orientalist, who was also fortunate in obtaining a paper impression of the inscription before the stone was broken. The inscription dates about 850 B.C., and is the oldest known in the Hebrew-

Moabite Stone.

Phoenician form of writing. It was erected by Mesha, king of Moab, and is a record of his wars with Omri, king of Israel, and his successors. The narrative also treats of Mesha's wars against the Edomites.

Consult Ginsburg, Christian David, *The Moabite Stone* (London 1871), and Bennett, W. H., *The Moabite Stone* (Edinburgh 1911).

MO'ALLAQAT, or **MU'ALLAQAT**. See ARABIC LITERATURE.

MOAT. See FORTIFICATIONS.

MOBANGI. See UBANGI.

MOBERLY, mō'hēr-lī, **George**, English prelate: b. St. Petersburg (now Leningrad), Russia, Oct. 10, 1803; d. Salisbury, Eng., July 6, 1885. He was educated at Winchester and Oxford. He was consecrated Bishop of Salisbury in 1869, and in 1872 urged omission of the damatory clauses from the Athanasian Creed.

MOBERLY, **Robert Campbell**, English theologian: b. Winchester, July 26, 1845; d. Oxford, June 8, 1903. He was the son of George Moberly (q.v.). He was educated at Winchester and Oxford, and became regius professor of pastoral theology at Oxford in 1892. He was honorary chaplain to Queen Victoria (1898-1901) and chaplain in ordinary to Edward VII in 1902.

MOBERLY, city, Missouri, Randolph County, altitude 872 feet, is located 34 miles north of Columbia, on the Missouri, Kansas and Texas, and the Wabash railroads, in a grain-growing and dairy-farming region. Valuable deposits of fire clay and coal are nearby. The Wabash Railroad has machine and car repair shops here. Manufactured products include syrups, dairy products, shoes, hosiery, and farm implements and equipment. Moberly Junior College, coeducational, is here. Platted in 1866, on the watershed between the Missouri and Mississippi rivers, Moberly received a city charter in 1873. Pop. (1950) 13,115.

MOBILE, mō-hēl', city, Alabama, county seat of Mobile County, is situated in the southwestern part of the state on Mobile River at its entrance to Mobile Bay, 31 miles from the Gulf of Mexico, 179 miles from Montgomery, the capital of Alabama, and 139 miles by rail from New Orleans. The city is built on a level, sandy plain from six to 35 feet above the river and rising gradually to the tablelands, 200 to 300 feet above sea level, six miles west of the river.

Transportation Facilities.—Mobile is served by the Alabama; Tennessee and Northern; Frisco; Gulf, Mobile and Ohio; Louisville and Nashville; and the Southern railroads. Daily air service is provided by major air lines operating between New York and New Orleans, La., with connections for cities east, west and north of Mobile; and between Mobile and Jacksonville, Fla., with connections for the West Indies, Central and South America. The Port of Mobile has one of the largest and most complete systems of warehouses and docks on the Gulf of Mexico, and ocean-going vessels provide adequate service to all ports of the world as well as to ports on the Atlantic and Pacific coasts. The Alabama, the Tombigbee, the Black Warrior rivers and the Intracoastal Canal provide inland water routes over which barge lines are operated between Mobile and Demopolis, Selma, Montgomery and Birmingham. There is also an inland waterway between Mobile and West Florida cities, and to Louisiana and Texas ports. The ship channel is maintained by the United States Government at a minimum depth of 32 feet, and a minimum width of 300 feet. Across the outer bar the channel is 36 feet deep and 450 feet wide. Bates Field, the municipal airport, embraces 163 acres, and here too is the Army's Southeast Air Depot, Brookley Air Force Base.

Education.—Mobile and Mobile County jointly operate an excellent public school sys-

tem. In 1950 there were 48 schools for white children in Mobile and Mobile County, with over 30,223 pupils enrolled, and 32 schools for colored children with about 13,827 pupils enrolled. The school buildings are of modern construction, most of them being built of brick or concrete and tile. One of the noteworthy buildings of the Mobile school system, from a historic standpoint, is Barton Academy, the first public school erected in the State of Alabama. It was completed in 1836. The building has been remodeled and is in use as an elementary school. Spring Hill College, established in 1830, is a senior college of arts and sciences offering courses leading to the degrees of bachelor of arts, bachelor of science, and bachelor of science in Commerce. Courses in law, medicine, and engineering also are offered.

Religion.—When the first settlement was established by the French in 1711, the "Church" was one of the original buildings, and one of the present churches stands nearly on the same site. There are in the city more than 150 churches for white and colored persons. They represent practically all religious denominations.

Public Parks.—Mobile has 13 public parks, including famous Bienville Square, in the heart of the city. In addition, there are several private parks that are open to visitors.

Places of Interest.—There are numerous attractions for tourists in Mobile. One of these is the home of Joseph Jefferson, famous actor who created the role, *Rip Van Winkle*. Seasonal attractions include Azalea Trail, a 17-mile flower lined drive over city and suburban streets, passing Bellingrath Gardens in Mobile County, one of the famous beauty spots of the South. The flowers along the Trail bloom in late winter and early spring and each year attract thousands of visitors. Another seasonal attraction is the Mardi Gras festival, observed each year for 10 days prior to Ash Wednesday, or the beginning of Lent. It was in Mobile that the first Mardi Gras was celebrated in this country. Another annual attraction is the Alabama Deep Sea Fishing Rodeo, held in the waters of lower Mobile Bay and the Gulf of Mexico. It attracts fishermen from all parts of America.

Mobile was the home of Admiral Raphael Semmes, Confederate naval officer; of Gen. Braxton Bragg of the Confederate Army; of Gen. William C. Gorgas, U.S.A., who rid the Panama Canal Zone of yellow fever; of William A. Alexander, who designed and built a submarine during the Civil War; of Rufus W. King, Vice-President of the United States, 1853-1857, and before that United States senator and minister to France.

Industries.—Mobile has experienced a remarkable industrial development within recent years. The city was selected by the federal government as a site for a United States Army air depot, which was constructed at an initial cost of \$8,000,000. The output of Mobile factories in 1950 exceeded in value \$250,000,000.

The leading industries include shipbuilding and repairing, the manufacture of paper and pulp, the reduction of bauxite, cotton manufactures, lumber, timber and related products, oil refining, clothing, the mixing of fertilizers, naval store extraction, processing of food products, paint manufacture, steel fabrication, and the manufacture of asphalt and asbestos roofing. The pulp and paper industry includes a large kraft paper

mill, bag plants, a plant for the manufacture of insulation board, and a boxboard plant. The textile industry operates two cotton cloth mills and a garment factory. There are hardwood lumber mills, pine wood saw mills, creosoting plants, veneer plants, millwork plants, and cabinet, cooperage, box, plywood, and panel plants.

Mobile is also the center of a large wholesale and retail business. In 1950, the jobbing business alone amounted to about \$50,000,000 a year, and the retail business was estimated at \$140,000,000 a year.

Commerce.—Mobile is one of the leading cotton markets and shipping points of the country, the natural center of the Alabama-Tombigbee cotton region, the nearest tidewater shipping port for the soft coal, iron, cement, lime, lumber, turpentine, resin and agricultural products of the southern, central and northern sections of Alabama and large amounts from upper Mississippi and lower Tennessee. It is the third largest tropical importing city in the United States; has steamship connection with Europe, Cuba, Central America, Mexico, Windward and all Caribbean Sea islands, Brazil, the Pacific coast of the United States, western coast of South America, Australia, New Zealand, Hawaiian Islands, Japan and China, via the Panama Canal, to which Mobile is the nearest, deep, fresh water railroad-connected city in the United States. In 1928 the Alabama State Docks Commission completed a State ocean terminal occupying a site of 550 acres on the west bank of the harbor at a cost of \$12,000,000. The accommodations of this ocean terminal are open to all shippers, shipping lines, and railroads. The principal units of the terminal are four piers, several cotton warehouses, a coal and bulk material handling plant, a terminal railway, and an industrial canal.

Mobile's commerce was further facilitated by the completion in 1927 at a cost of \$2,500,000 of the Cochrane Bridge, stretching 10½ miles across the headwaters of Mobile Bay and spanning the widest gap on the entire route of the Old Spanish Trail (U.S. 90) from Florida to California. The one-half mile Bankhead tunnel under Mobile River, completed in 1941, the first underwater vehicular tunnel in the south, shortened the distance across the bay by nine miles. The Florida-Midwest, and federal highways No. 31, 43 and 45 also converge at Mobile.

Commerce statistics for the city of Mobile include for exports cotton and subsidiary products, coal, coal oil, crude oil and by-products, iron, iron pipe, cement and cement products, lime, whiting, fuller's earth, lumber and allied products, tar, turpentine, resin, livestock, canned foods and other canned products, flour, lard, salted and pickled pork, salt, soap, cotton goods and notions, gun shells and other ordnance stores, general foundry and machinshop products, agricultural and mill machinery, belting and other mill supplies, fire and burglar-proof safes, scales, type-writing, computing and other machines; also store and office furniture and fixtures, electrical supplies, hardware, cordage and ship supplies, hay, grain, garden, flower and field seed, household furniture, sewing machines, musical instruments.

Among its imports, are Cuban magnetic iron ore, zinc, ammonia sulphate, sulphur ore, iron pyrites, sodium nitrate, fire brick, tropical fruits and other products, coffee, molasses, sugar, sisal grass, chicle gum, mahogany logs and lumber, iron, satin, sandal, lignum vitae woods, dye woods,

cork, cigars, Cuban tobacco, Peruvian bark, opium and other drug materials, camphor, sponges, bird lime, dried bone, phosphate rock, asphalt, lemons, limes, olives and olive oil, raisins, currants, nuts, prunes, matting, bamboo poles and rods, together with a miscellaneous line of embroidery, laces, rugs, and toys. The importation of Cuban molasses or black strap, used in the making of stock feed and explosives, has increased to a greater extent than any other article of late years.

Hospitals.—There are six hospitals in Mobile, including City Hospital, operated by the Sisters of Charity for the city, and the United States Marine Hospital. Two new hospitals costing \$4,000,000 each replaced Mobile Infirmary and Providence Hospital in 1951.

Government.—Mobile has a commissioner form of government, with three commissioners, including a mayor. One commissioner is elected every two years for a term of six years, and while in office each commissioner serves for two terms of one year each as mayor. All departments of the municipal government, except the Police and Fire departments, are housed in the City Hall, which was the Confederate Armory in Mobile during the Civil War, and which recently was remodeled. The County Court House, housing the offices of the county government, stands directly across the street from the City Hall.

Population.—In 1930 Mobile's population was 68,202. In 1940 it was 78,720 with about 101,000 in the metropolitan area. In 1950 the incorporated city of Mobile had a population of 129,009 with 228,835 in the metropolitan area. Sixty-one per cent of the population come within the classification of "native-born whites"; 3 per cent are foreign born; 36 per cent are colored.

Federal Buildings and Services.—The federal government has a court house and office building in Mobile. Besides the courts and the post office, the federal services maintained in the city include the Gulf Division headquarters of the United States Coast Guard; the district office of the Army Engineers; Customs Office; lighthouse depot for the Gulf Coast; a bureau of the Department of Commerce; an Immigration Bureau; Weather Bureau; branch of the Social Security Board; an Employment Service Office; Internal Revenue Office; Public Health Service Station; branch of the Steamboat Inspection Service, and other agencies.

Water Supply.—The water supply of Mobile is municipally owned and operated, and comes from springs, unfiltered, with gravity flow into the city. The total capacity is 20,000,000 gallons daily. There are two reservoirs with a capacity of 10,000,000 gallons each. The daily water consumption of the city is between 13 and 18 million gallons. A \$7,000,000 industrial water supply system provides up to 50,000,000 gallons a day.

Utilities.—Natural gas is piped to Mobile from the Louisiana and Mississippi fields in high-pressure mains having a capacity of 160,000,000 cubic feet a day. Electricity is supplied by the Alabama Power Company.

History.—Twenty-seven years after Columbus discovered America, Spanish explorers mapped Mobile Bay, but it was not until 1699, nearly two centuries later, that adventurous Frenchmen under the leadership of Le Moyne d'Iberville landed on Dauphin Island at the entrance to the bay with the first colonial enterprise ever attempted on the shores of the Gulf of Mexico. In 1711, after

many vicissitudes, Jean Baptiste Le Moyne, Sieur de Bienville, the younger brother of d'Iberville, established a permanent colony on the present site of Mobile under the name of Fort Louis de la Mobile—the first part of the name honoring le Grande Monarque Louis XIV and the last part for the Mauvilla tribe of Indians who lived in the vicinity. France ceded Mobile and the territory east of the Mississippi to Great Britain in 1763. The practical British explored the rivers and sounded the bay, leaving excellent maps for historians. They improved the fort and built up a good trade with the Indians.

In 1779 Spain declared war on Great Britain. Hostilities spread to the American Colonies. The Spanish under young Bernardo Galvez captured the fort at Mobile after burning a large part of the town and the banner of St. George was lowered. The colony remained under the rule of Spain for 33 years, and enjoyed a good trade with Europe. During this period the Spanish king favored many of his subjects with large grants of land and consequently many titles to property in Mobile today date back to the Spanish occupation.

In 1800 Napoleon forced Spain to cede to France the province of Louisiana, then in 1803 President Thomas Jefferson purchased Louisiana from France. The treaties were not clear and although the United States from then on claimed Mobile, Spain insisted that Mobile was in Florida and not in Louisiana and Spanish officers remained in authority. The population in 1803 was 810 people.

When the war of 1812 broke out between the United States and England, the Spanish ports were being used by the English. President James Madison directed General James Wilkinson to capture Mobile, and the community came under the American flag in April, 1813. Gen. Andrew Jackson made his headquarters in Mobile in several of his Indian campaigns and for a large part of the time during the war with England in 1812 and 1813.

After the War of 1812 was over, the community grew rapidly and was incorporated as a city in 1819. The first newspaper was published in 1812; Spring Hill College was built in 1830. America's first Mardi Gras was staged here in 1830. Gas lighting was introduced in 1835. Barton Academy was completed in 1836. In 1836 the Cedar Point Railroad was started to parallel the bay to Dog River. In 1848 a charter was granted for building a railroad from Mobile to the Ohio River. Construction of the Custom House was started in 1852. Street railways were laid in 1861. The population of Mobile at that time was nearly 15,000 people.

When the clouds of civil war gathered over the Nation, Alabama seceded from the Union and in January, 1861 the flag of the Republic of Alabama was unfurled over the state capitol.

Alabama became one of the Confederate States of America in March, 1861. Mobile was one of the most important Confederate ports and one of the famous naval battles of American history was fought in Mobile Bay by Federal and Confederate fleets in August, 1864. In that battle Federal forces took command of Mobile Bay but the city did not fall into the hands of the Union troops until April 12, 1865, three days after General Robert E. Lee surrendered at Appomattox.

Then followed the difficult reconstruction

period, but the city soon renewed its march of progress. Railroads pushed their lines into the city, the harbor was further improved and in 1870 an appropriation of \$50,000 was made to survey the channel from Mobile to deep water. The first project was for a channel 13 feet deep and 200 feet wide. The present channel is 32 feet deep by 300 feet wide and 31½ miles long.

Mobile took an active part in the World Wars. Large shipbuilding plants were operated here and the port was very active in shipping supplies to American forces overseas.

Consult Powell, J. P., ed., *Historic Towns of the Southern States* (New York 1900); Hamilton, P. J., *Colonial Mobile* (Boston 1910); id., *The Founding of Mobile 1702-18* (Mobile, 1911).

MOBILE, river, Alabama, the name given to the western stream or mouth of the river formed by the junction of the Alabama and Tombigbee rivers. The eastern stream or mouth is called the Tensaw. From this junction of the rivers to the head of Mobile Bay is, in direct line, about 25 miles, but the winding of the stream makes its course about 50 miles long. The Mobile and Tensaw communicate at several points, but the two streams enter Mobile Bay at the city on Mobile by the same delta. With its tributaries, the Mobile River drains an area of about 42,300 square miles. There is a large river traffic between Mobile and the Birmingham area via the Black Warrior River, and with Montgomery via the Alabama River.

MOBILE BAY, a bay on the southwest coast of Alabama, forming an estuary into which, through the deltaic mouths of the Mobile and Tensaw branches, flow the waters of the Tombigbee and the Alabama rivers. That part of the estuary to which the name of Mobile Bay is applied is about 30 miles long and from 9 to 12 miles wide. At the entrance to the bay are long narrow strips of land, almost obstructing the entrance. On the east, at Mobile Point, is a revolving light; on the west, on Dauphin Island, are Forts Morgan and Gaines. Between Dauphin and the mainland is Grant's Pass, a strait connecting Mobile Bay with Mississippi Sound. The United States government has improved the harbor, and from a shallow entrance, which was a hindrance to navigation, there is now a channel through which vessels drawing 30 feet and over can enter and ascend to the wharves of Mobile city.

MOBILE BAY, Battle of, a battle of the Civil War fought Aug. 5, 1864. Mobile Bay is divided from the Gulf of Mexico by Mobile Point east and Dauphin Island west, about three miles apart; but the ship channel of less than 2,000 yards, narrowing to 750 outside, closely skirts Mobile Point. The latter was defended by Fort Morgan; the island by Fort Gaines, too far from the channels to be very formidable. Between them stretched a line of piles and torpedoes, but leaving a narrow channel for blockade-runners. Within was the Confederacy's most powerful ram, the *Tennessee*, and three small unarmed paddle-wheel gunboats. Commander David Farragut's Federal fleet comprised the monitors *Tecumseh*, *Manhattan*, *Winnebago* and *Chickasaw*, forming an inshore column; and the wooden sloops of war *Brooklyn*, *Hartford* (flagship), *Richmond*, *Lackawanna*, *Monongahela*, *Ossipee* and *Oneida*, forming an

outer one, each with a smaller mate lashed to the port side, to ensure passage through if the starboard vessel's machinery should be disabled. Farragut would have led in the *Hartford*, but the *Brooklyn* had machinery for picking up torpedoes. The advance began at 5.30 A.M., and firing at 7.05; the instructions were to keep east of the red buoy, but the *Tecumseh* went west and was sunk by a torpedo. The *Brooklyn* stopped in fear of a like disaster, and the *Hartford* with Farragut passed her and led the fleet into the bay. Each vessel received much damage from Fort Morgan, but they silenced its guns by destructive fire, and all succeeded in anchoring three miles up. One Confederate gunboat was then sunk, one was captured, and one took refuge next the fort; the *Tennessee* was to be attacked after dark, but itself assailed the flagship, and after a desperate fight was disabled, and surrendered. The *Lackawanna* collided with the *Hartford* and nearly sank her. The Union fleet lost 52 killed, 170 wounded, and 113 drowned in the *Tecumseh*; the Confederates 10 killed, 16 wounded, and 280 prisoners, besides the casualties in the fort. Both forts surrendered a few days later. The Union fleet carried 159 guns, and the officers and crews numbered 3,000 men. The Confederate fleet carried 22 guns and 470 officers and men.

MOBILES, mō'bēlz, in art, three-dimensional abstract compositions made of metal, wood, plastic, glass, cardboard, wire, thread, or any combination of these. The composition is essentially a combination of two-dimensional shapes, together with the light and space between them. A mobile differs from abstract sculpture, first, in that it is not a continuous solid form, although the work of some modern sculptors like Henry Moore resembles the mobile in this respect; and, second, in that it is intended to move in certain predetermined ways. Its characteristic movement is, in fact, the most distinctive feature of the mobile (hence the name).

In order that the construction may move, it must be suspended freely in space. This is generally done by hanging it from a ceiling, although some mobiles are mounted on pedestals or stands in such a way as to allow freedom of movement. The possibility of movement is derived from the fact that the component parts of the composition are held together by thin wire (or thread), which allows them to swing in response to the circulation of air, the only motive force involved.

Aesthetically as well as mechanically, the most important element in a mobile is balance. Although the composition moves, it must also be in dynamic equilibrium. Balance is secured by the skillful handling of shapes and space relationships, and by the proper use of color, which can add to or reduce the apparent massiveness of the component forms. The artistic problem is to secure balance without sacrificing variety or complexity of design.

Although mobiles are usually composed of abstract shapes, realistic forms like leaves, fish, or birds are sometimes employed as well, without necessarily being combined to constitute a realistic whole. A related art form called the *stabile* retains the airy spatial quality of the mobile but lacks its power of movement.

The mobile as an art form is a very modern development. Its creator is Alexander Calder (1898-

working in wire sculpture about 1930 and had his first one-man show in Paris in 1931. From the beginning, his aim was to suggest movement in his abstract constructions; not satisfied with this, he went on to install mechanisms and motors which actually moved the parts. The next step was the creation of forms that would move "naturally," without mechanical aids—that is, mobiles.

Since their origin in the 1930's, mobiles have won widespread acceptance as genuine art forms, and the work of Calder and others in this genre has received international recognition. Mobiles have become increasingly popular as decorations in homes and places of business. They have also been put to more pragmatic use as a means of displaying small articles of merchandise in shop windows and on counters. Since no elaborate technical training is required, the creation of original mobiles has become a popular hobby as well. Schools have found them an excellent way to introduce children to the excitement of artistic creation.

Consult Sweeney, James J., *Alexander Calder*, rev. ed. (New York 1951); Lynch, John, *How to Make Mobiles* (New York 1953); id., *Mobile Design* (New York 1955).

MOBILIER, Cr dit. See CR DIT MOBILIER OF AMERICA.

MOBIUS, m 'b - s, **August Ferdinand**, German mathematician: b. Schulpforte, Germany, Nov. 17, 1790; d. Leipzig, Sept. 26, 1868. He was educated at Leipzig University, and became professor of astronomy there in 1816. He also studied at G ttingen under the eminent mathematician and astronomer Karl Friedrich Gauss. From 1844 M bius was director of the Leipzig observatory. His writings in pure mathematics—and in particular his chief work *Der barycentrische Kalk l* (1827)—were of importance to the development of analytic projective geometry, especially in the use of homogeneous equations and the geometric principle of duality (of which he was an independent discoverer). His son THEODOR M BIUS (1865-1890), an authority on Old Norse philology, was professor of Scandinavian languages and literature at the University of Kiel (1865-1889).

MOBY-DICK, m 'b  d k, Herman Melville's greatest novel, was published in London and New York in 1851. The English edition, somewhat bowdlerized, appeared under the title of *The Whale* and was presented to the public ostensibly as a description of whales and the whale fisheries. The work is really made up of three elements. One of these is a fairly full and accurate account of American whaling customs in the 1840's and the natural history of the sperm whale. The second is an exciting narrative depicting the hunt for a particular white whale, Moby-Dick, by mad Captain Ahab, who has previously lost one leg to its ferocious jaws. The third element is philosophical commentary upon human life and fate. This last has been variously interpreted. Some find the book an involved allegory representing the revolt of Satanic Ahab against his God. To others the white whale symbolizes evil, and Ahab is a Promethean figure who courageously struggles against it. Melville, however, leaves little doubt of his intention to show Ahab as a rebel protesting against fate and as one who considers the individual capable of warring

against the forces of nature which limit his powers. Whatever he symbolizes, Ahab's final failure reveals the tragedy of unconquerable pride. So rich in symbolism is the style of the book that every reader can interpret the underlying philosophy according to his own prejudices. Some even read the book as pure adventure, though there can be no question of its author's desire to present moral and philosophical ideas as well as entertainment. *Moby-Dick* has been called "the one undoubted classic" of American literature.

TYRUS HILLWAY,
Associate Professor, Colorado State College of
Education.

MOCCASIN, mōk'a-sin, among American Indians (the word is of Algonquian origin), a one-piece, heelless shoe formed of undressed soft leather, usually deerskin, seamed at the instep and heel. The Plains Indians added a hard sole of rawhide. Moccasins were decorated with porcupine quills until white traders made beads available. Sturdy and comfortable, moccasins have become popular as house shoes in soft leather and as outdoor shoes in heavy leather. The usual type has the vamp gathered to the edge of a U-shaped tongue over the instep. They are often lined.

MOCCASIN FLOWER (also called LADY'S-SLIPPER), a terrestrial North American orchid of the genera *Cypripedium* and *Fissipes*, found from Newfoundland to Minnesota, south to North Carolina, Tennessee, and Virginia where it ranges to altitudes of 4,500 feet. It blooms in May and June, has two broad basal leaves and a delicate purplish-pink flower (sometimes white) with darker veins, on a single stem. Two of its three greenish-purple sepals are laterally united. The pouch-shaped lip of the flower, somewhat resembling a moccasin or slipper, accounts for its name. Other common names for it are Indian moccasin, Noah's ark, and squirrel's shoes. It is the state flower of Minnesota. See also ORCHID—*Cypripedium*.

MOCHA, mō'chā, island, Chile, included in Cautin Province, is about 20 miles off the coast, in the Pacific Ocean. It is about 8 miles long, 3 miles wide, and rises to an altitude of 1,768 feet. The chief industry is horse breeding. Pop. (1940) 482.

MOCHA, mō'kā (Arabic موكها, mōk-kā'), town, Yemen, in Taiz Province, on the Red Sea, 45 miles north of Bab el Mandeb Strait and 105 miles south of Hodeida. During the 16th and 17th centuries it was a flourishing port from which was shipped the fine Arabian coffee that became known by its name. The town declined steadily in the 19th century. Pop. (1948) 600.

MOCHA STONE. See AGATE.

MOCK ORANGE, a name commonly applied to any shrub of the genus *Philadelphus*, family Saxifragaceae (saxifrage). In the United States the name is also applied to the southern buckthorn (*Bumelia lyciodes*), the cherry laurel, the Osage orange, and several other shrubs and trees. In Australia it is the common name for the native laurel (*Pittosporum undulatum*). See also SYRINGA.

MOCKERNUT. See HICKORY.

MOCKINGBIRD, mōk'ing-būrd, an American bird, *Mimus polyglottos polyglottos*, the eastern species in the United States ranging from Maryland through Ohio, Illinois, Iowa, Nebraska, and south to the Gulf of Mexico, with a few found as far north as Massachusetts and the Great Lakes; the western species ranging through central California south to Vera Cruz, Mexico. The bird is about the size of a robin, though more slender. Its average adult length is about 10 inches, with a wing spread to 15 inches. Its plumage is a pale brownish gray above, grayish white below, with white wing and tail patches. It has a beautiful and exuberant song of its own, a long sequence of notes in great variety, each phrase repeated several times in succession, and it is also able to imitate the calls of many other birds. The mockingbird often sings at night, especially on bright moonlight nights. In the South, it begins to sing in February and continues singing throughout the spring. It makes its nest of coarse twigs lined with roots and grasses, in thickets and low trees; its eggs, 3 to 6, are pale bluish green in color, flecked with brown, and take 14 days to hatch. There are two or three annual broods. The bird shows great courage in defending its nest from enemies, especially snakes. During the spring and summer its food consists largely of insects, such as grasshoppers, ants, flies, boll weevils, wasps, even spiders and caterpillars. In autumn it eats the berries of wild trees and shrubs, such as sumac, wild grape, Virginia creeper, barberry, and hittersweet. It is the state bird of Arkansas, Florida, Mississippi, Tennessee and Texas.

MOCQUEREAU, mō-krō', Dom André, French musicologist: b. La Tessoualle, near Cholet, France, June 6, 1849; d. Solesmes, Jan. 25, 1930. He was educated in Paris, and while still very young appeared as a violoncellist in Jean Charles Dancla's chamber music concerts. He entered the Benedictine Order at Solesmes in 1875, and under Dom Joseph Potier made a special study of Gregorian plain song, in which he became an acknowledged authority. In 1889 he founded the important musical quarterly *Paléographique musicale* (17 volumes), and remained its editor until 1928. In it he published liturgical chants of the Roman Catholic Church in all their forms and in all epochs, with accounts of researches into their history, and with photographic reproductions of medieval plain song manuscripts. In 1904, by order of Pope Pius X, it was made the authoritative reference for all reprints of Gregorian music appearing thereafter in the *Editio Vaticana*. Among Dom Mocquereau's works on musical history or theory are *L'Art grégorien* (1895); *Notes sur l'influence de l'accent et du cursus tonique latins dans le chant ambrosien* (1897); *Méthode de chant grégorien* (1899); and his most important theoretical work, *le Nombre musical grégorien ou Rhythmique grégorienne* (1908); his *Antiphonale monasticum* was published posthumously in 1934, and work was being done (1954) on a new Gradual.

MODDER, mōd'ēr, river, Union of South Africa, in Orange Free State. It rises northeast of Bloemfontein and flows west for about 225 miles to join the Riet River, a tributary of the Vaal, about 22 miles southwest of Kimberley. It came into con-

derable prominence during the Boer War of 1899-1902; along its banks at Maagersfontein the British were driven back with great loss in 1899, and at Paardeberg the Boer general, Cronje, surrendered in 1900.

MODE, in music, (1) the manner of arranging the tones and half-tones in a scale, this general designation being always accompanied by a qualifying adjective, as Dorian mode, minor mode. Greek music, from which our modern music has been evolved, had an elaborate system of nine modes, which were afterward extended to 15. Authorities vary considerably as to the differences between the modes; it is certain, however, that they were the outgrowth of an earlier Greek music, the basis of which was the tetrachord. A tetrachord is a short scale of four notes, one of the intervals being a half-tone and the others whole ones, for example:

(A) Dorian tetrachord, half-tone, $\frac{1}{2}$; (B) Phrygian tetrachord, half-tone, $\frac{1}{2}$; (C) Lydian tetrachord, half-tone, $\frac{1}{2}$. The slur indicates the half-tone.

The tetrachords were probably named after the people that originated them.

Until the time of Terpander (7th century B.C.) all Greek music seems to have been confined to the limits of a tetrachord. The lyre, which was then used merely to give the singer the pitch, had but four strings, each capable of sounding but one note. It was tuned in one of the ways shown above, though the notes written should be understood to be merely relative, each singer tuning his lyre to suit his own voice.

Terpander increased the compass of the lyre by adding a second tetrachord to the first, using the highest note of the first for the lowest of the second, thus making an incomplete scale of seven notes.

The middle note, A, belonging to both tetrachords, was called *Mese* (middle) and had somewhat the function of our modern keynote. It will be noted that the two tetrachords are both Dorian, which was the characteristic and favorite Greek tetrachord rather than the foreign Phrygian or Lydian.

Pythagoras (582 B.C.) is the reputed author of the octave system (the foundation of our modern system). He probably learned it during his visit to Egypt, where it is said to have been in use for many centuries before. By this system the two tetrachords, instead of having a note in common, were separated by a whole tone, called the diazeutic tone or tone of disjunction.

A was still the keynote or Mese, though no longer the middle or connecting note. Terpander's was called the conjunct system and Pythagoras' the disjunct system. The latter as above printed constituted the Dorian mode, which may be defined as two Dorian tetrachords separated by the diazeutic tone, embracing the compass of an octave. Terpander's system, not having this compass, cannot strictly be called a mode. Music seems to have developed on both these systems simultaneously in Greece, though finally that of Pythagoras supplanted Terpander's and became universal.

By replacing the two Dorian tetrachords with two Phrygian or two Lydian the modes of the same name were formed.

These three were the principal modes. Each had two auxiliary modes, one commencing a fourth below and distinguished by the prefix *hypo*, the other commencing a fourth above with the prefix *hyper*. The complete list of the nine original modes is as follows:

- I. Dorian.
- II. Phrygian.
- III. Lydian.
- IV. Hypodorian or Æolian.
- V. Hypophrygian, or Ionian.
- VI. Hypolydian.
- VII. Hyperdorian or Mixolydian.
- VIII. Hyperphrygian or Locrian.
- IX. Hyperlydian.

A convenient way to remember them is to imagine a series of scales, all of natural notes, and an octave in compass, beginning on each of the seven natural notes. It should be remembered that the pitch is entirely relative; each of these modes might begin on the same actual sound. The Mese or Keynote is the fourth note of each scale.

On examination it will be seen that the three Dorian modes are each formed of two Dorian tetrachords, the three Phrygian modes of two Phrygian tetrachords and the three Lydian modes of two Lydian tetrachords. In the three principal modes the diazeutic tone separates the tetrachords. In the hypo-modes it is the

lowest note and in the hyper modes it is the highest note. In all the hypo and hyper modes the tetrachords are conjunct like those of Terpander. It will be seen that two of the hypos

correspond exactly with two hypens, namely, the hypophrygian and the hypodorian are the same as the hyperlydian and the hyperphrygian. It will be observed, however, that the arrangement of the tetrachords and the diazeuctic tone are not the same.

Each mode was said to have its characteristic quality or sentiment; the Dorian seems to have been the favorite one for heroic utterance, while the Lydian was said to be languishing and erotic.

The modes were afterward increased to 15, at least three of which were mere transpositions by octaves of earlier modes. In fact some theorists hold that the later development of the Greek modes completely changed their original significance and that instead of their being different arrangements of whole and half tones in a scale they were all identical in formation and were in fact merely Dorian modes of different pitch. If this is so they should not be called modes at all, but keys, as in modern music. The modern system of equal or even temperament (see TEMPERAMENT) adopted and developed by Johann Sebastian Bach early in the 18th century and in general use since the middle of the 19th century, would thus appear to have been known to some extent among the ancient Greeks. The titles of the modes seem to contradict this theory, but the subject is so confused and the different theories so difficult of proof that wide differences of opinion will probably always exist. The complete list of the 15 modes is as follows, the pitch given being said to be the accepted one for each mode (or key):

Fourths below	Originals	Fourths above
Hypodorian (A)	Dorian (D)	Hyperdorian or Mixolydian (G)
Hypoionian (B \flat)	Ionian or Iastian (E \flat)	Hyperionian (A \flat)
Hypophrygian (B)	Phrygian (E)	Hyperphrygian or Locrian (A)
Hypoæolian (C)	Æolian (F)	Hyperæolian (B \flat)
Hypolydian (C \sharp)	Lydian (F \sharp)	Hyperlydian (B \sharp)

The Greeks had in addition three kinds of chromatic modes and an enharmonic mode. They were all modifications of one or both of the interior tones of the tetrachord, the outer tones of which were never allowed to change their relative pitch. These modes had no significance in the history of music and were not adopted by the Romans.

The following are examples of Pythagoras'

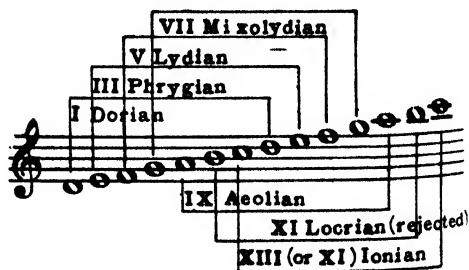

original Dorian mode changed to (a) chromatic and (b) enharmonic:

The X is used to represent a sound one-quarter of a tone higher than the one preceding it.

The Gregorian or ecclesiastical modes are based on the Greek modes, though many errors and changes of names were made in arranging the system. Saint Ambrose, bishop of Milan, chose four of the ancient modes which he named Authentic. Gregory the Great is said to have added four others called Plagal. Six more were afterward added, making 14, two of which were declared imperfect and rejected. There are two kinds of Gregorian modes, the Authentic and the Plagal. The final or keynote of the authentic modes is the lowest note of its scale. Each authentic mode has an attending plagal mode, a fourth below it, the keynote of which is the same as that of the authentic mode. The plagal modes are therefore similar in this sense to the Greek modes, the fourth notes of which were said to be keynotes. The Gregorian modes are numbered, the authentic receiving the odd and the plagal the even numbers. In addition, the old Greek names are used, the plagal modes receiving the prefix hypo, but unfortunately the Gregorian and Greek titles do not correspond, causing great confusion in all references to the modes. Thus, the Gregorian Hypophrygian is the same as the Greek Hyperdorian and the Gregorian Hypomixolydian with the Greek Phrygian.

As in the Greek modes it is convenient to remember the Gregorian modes by imagining a series of scales, all of natural notes and an octave in compass, beginning on each of the seven notes. These are the authentic modes from which the plagal with their prefix hypo can be readily counted. (It should be remembered that the pitch is entirely relative as in the Greek scales).

The Gregorian modes are still in use in the Roman Catholic Church, to the services of which it adds a remarkable effect of antiquity and solemnity.

In modern music but two of the old modes remain; the major, equivalent to the Greek Hypophrygian (or Hyperlydian) and the Gregorian Ionian, and the minor, equivalent to the Greek Dorian and the Gregorian Æolian

the choice of these two modes took many centuries and must have been made by entirely unconscious perception of their greater value, especially of that of the major scale. A comparison of the major scale with the favorite Dorian mode of the Greeks shows that the modern ear desires the half tone at the top of a triad instead of the bottom, as they did. Whether the favor in which the Dorian tetrad was held by the Greeks is a proof that they thought their music *downward* and were therefore doing just the same as we do when we think ours *upward* is very doubtful, though a well-known theorist has advanced this clever idea. It is much more likely that the introduction of harmony caused a greatly increased cognition of the true function of the keynote, which, as we understand it, was unknown to the ancients. To us the keynote (in any octave) is the only rest point to the ear; all other notes of the scale trend toward it more or less strongly, and in the instance of an ascending major scale the seventh note (the so-called leading note) demands it more than any other note. This quality of motion and rest led to the greater importance of the major mode over the minor, the seventh note of which, being a whole tone distant from the keynote, lacked the great desire to progress these which are so important a characteristic of the major. Finally, probably by accident at first, the seventh note of the minor was raised so as to be but a half tone below the keynote; this form of the minor key is now known as the "harmonic minor," and is the only one recognized harmony.

But the distance from the sixth to the seventh being thus made a tone and a half, a very difficult interval to sing or treat melodically, the sixth was raised to secure smoother and easier passage upward and as the double change had made the upper part of the minor mode identical with the major it was argued that neither raising the note nor raising sixth was necessary in ascending, so both were restored to their original position in descending. This is known as the "melodic minor."

(2) A term used in mediæval music to indicate the relative value of the Large, the Long, the Breve. Two kinds of mode existed, great and less, the first deciding the relation of the large to the long and the second that of the long to the breve. Both kinds could be perfect or imperfect. In great mode perfect the large is equal to three longs. In great mode imperfect it was worth but two longs. In less mode perfect the long was equal to three breves, in less mode imperfect it was equal to two breves. During the end of the 15th century and the beginning of the 16th musicians made extraor-

dinary difficulties in their compositions by means of mode and prolation. See GREEK MUSIC; MEANTONE; DIAZEUIC TONE; TEMPERAMENT.

GEORGE GORDON THUNDER,

Revised by C. LEONARD STUART, Editorial Staff of The Americana.

MODELING. The production of a temporary plastic form to be later executed in permanent condition copying this original, or the forming of a facsimile of an original shape. Modeling can be done in reduced, enlarged or true proportions (*to scale*) according to their purpose. Modeling is usually done in clay, plaster of paris, wax, wood or other plastic material. The sculptor almost invariably makes a model of his creation before treating it in the permanent medium. Gold and silver smiths and jewelers reduce their conceptions to plastic models before going to the expense of evolving the design in the precious metals. The ship-builder usually works from a reduced facsimile or model of the desired construction. The artist, in producing the effect of relief or solidity in a plane (flat) surface, terms his shading and perspective manipulation "modeling."

MODENA, mô'dě-nā, Italy, a city and province, part of a former duchy now comprised partly in the compartimenti of Emilia and Tuscany.

The city, capital of the province, pleasantly situated in a fertile plain, between the Secchia and the Panaro, 25 miles northwest of Bologna, is built with great regularity, and has spacious streets and fine promenades on the site of its former ramparts. It consists of three parts—the citadel, the old town and the new town. The most remarkable edifices and establishments are the cathedral, a fine specimen of Romanesque, adorned in front with numerous curious sculptures; the Campanile, erected in 1224-1319, 335 feet high, and one of the finest in North Italy; the church of San Francisco, a handsome Gothic structure, containing a fine terracotta group of the Descent from the Cross, by Begarelli; several other churches; the ducal palace, begun in the 17th century, but enlarged by numerous modern additions, and forming a splendid structure, now used as a military school; the Albergo Arti or building containing the municipal collections, especially the Estense Library of over 150,000 works, including several thousand MSS., and the picture-gallery embracing a large collection of paintings, several of them by the first masters; the theatre, the baths, the university, several other important educational institutions and charitable endowments. The manufactures consist chiefly of silk goods, silk twist, woolen and hempen cloths, leather and glass; the trade, however, is unimportant. Modena is the see of an archbishop, and possesses various important public offices. It existed under the Etruscans, and as Mutina rose to great splendor under the Romans. It afterward was repeatedly sacked by the northern invaders, whose ravages left few vestiges of its ancient grandeur. Pop. 91,416.

The former duchy bordering on Tuscany, Lucca, Bologna, Mantua and Parma, had an area of 2,573 square miles which in 1901 contained a population of 785,930. It is now divided into the provinces of Modena and Reggio in the compartimento of Emilia, and the province

of Massa e Carrara in the compartimento of Tuscany. Modena was made a duchy in 1452, the ruler being Duke Borso of the house of Este, to which noble family Modena had belonged since 1288. In 1796 the French took possession of the country and Modena afterward was included in the Cisalpine Republic. By the Treaty of Vienna in 1815 it was restored to the Este family. The duchy took an important part in the turbulent proceedings of the 19th century, which led to the consolidation of the Italian kingdom in 1860, when Modena proper was formed into a separate province with an area of 1,002 square miles. Pop. 421,022.

MODERN INSTANCE, A, by Mr. William Dean Howells, was published in 1882. The action takes place in Maine and in Boston, with one scene in Indiana, and the time is fixed by reference to events of the Hayes-Tilden presidential campaign of 1876. The story is one of domestic infelicity, and the tracing out of the gradual coarsening, physical and moral, of the husband, Bartley Hubbard, is a masterly piece of character delineation. The social and business life of a small town and the every-day experiences of a provincial couple embarking on life in Boston are presented with the author's happiest realism, and save the book from gloom or morbidness. Indeed, it is only after the reader has finished with the story, and finds himself impelled to reflect upon it, that he realizes how great a moral tragedy it portrays. 'A Modern Instance' raises more ethical questions than do most of Mr. Howells' novels, but the author is in no sense a propagandist. It may be his disinclination to commit himself on one of these questions that leads him to leave unsettled the fate of two of the chief characters. This indeterminate ending is condemned by those readers who complain that Mr. Howells' novels get nowhere, and the limitations and unheroic qualities of Marcia Hubbard are disapproved by those women who maintain that the author is never fair to their sex; but his kindly, photographic reproduction of the little things of modern life and his insight into social conditions lead those who sympathize with his ideas of fiction to rank this novel among his best.

WILLIAM B. CAIRNS.

MODERN LANGUAGE ASSOCIATION OF AMERICA. A society for the advancement of the study of modern languages and their literatures, through the promotion of friendly relations among scholars, the presentation and discussion of papers at meetings and the publication of results of investigations by members. It was incorporated in Baltimore in 1883, and membership is open to all persons on payment of \$5 annual dues. For geographical reasons a central association was incorporated in 1903, which holds meetings in the Western States independently of the parent body. The association issues an annual volume of publications in quarterly instalments. There are about 4,000 members, these including university professors, college libraries, and foreign scholars.

MODERN MACCABEES, Knights of the. See MACCABEES, THE.

MODERN PAINTERS, by John Ruskin (5 vols., 1843, 1846, 1856, 1860), was begun in order to vindicate the landscape painting of J. M. W. Turner against adverse criticism.

For this purpose Ruskin set forth systematically and extensively what he conceived to be the æsthetics of visual art—not of landscape painting only, but of painting in general and sculpture as well, with lengthy illustrations from their supposed analogues in literature.

the "Ideas Conveyed by Art" and of the several "Faculties" which produce or appreciate them. Incidental to the defense of Turner, he comes appraisals of other painters, and quotations of critics, which confuse the theoretical treatment; this, as the work goes on, becomes more and more arbitrary, digressive, desultory, and wilful, at the same time that it retires more and more from the reader's attention; until, though formally preserved throughout, it has lost, long before the end, all effectiveness as an organization of the subject.

The key to 'Modern Painters' lies much less in its systematic structure than in its theory—pervasive across all divisions and subdivisions, and persistent throughout Ruskin's 17 years of conscientious modification of opinion by study—concerning the general relation of man and art to nature. The notion that art can improve upon nature seemed to Ruskin presumptuous—a part of the pagan and Renaissance tendency to magnify man and his works. His own faith taught that man is depraved and fallen, and that there is no good in him. Hence Ruskin would minimize man's function in art; he is definitely opposed to human tradition, and is ready, with Wordsworth, to throw away the books and discard the schools. Greatness in art, moreover, commonly assumed to be an effect of human powers, is nothing of the sort; it is a divine gift. "Composition," "imagination," "idealization," and the like—which rearrange actuality to the ends of art—are not achievable by any amount of conscious effort; given humble labor, these things may, perhaps, be added unto it by God; they are a grace vouchsafed to the elect. Such is the evangelical tinge given by Ruskin to the ancient theory of the artist's divine inspiration, and to the modern preoccupation with the functioning of the subconscious. This Calvinism as regards man is supplemented, as regards nature, by that strange "natural religion"—Platonistic rather than Platonic—which so fascinated impulsive hearts in the late 18th and early 19th centuries. Nature, never having fallen, is sinless, pure and perfect; nature is the copy of a divine pattern: let man, then, follow nature; for

... every prospect pleases,
And only man is vile.

Marking the belated arrival in art criticism of the naturalistic revolt against the humanistic tradition of the Renaissance, 'Modern Painters' is to the criticism of painting what much what Wordsworth's 'Prefaces' and many of his poems—which Ruskin quotes continually—are to the criticism of poetry.

So understood, it becomes, historically, a document in that romantic anti-humanism "return to nature" which, for thoughtful persons of the newer generation, was ended by the publication of Darwin's 'Origin of Species' in 1859. We know now that nature is perfectly wasteful and unintelligent, perfectly cruel and unmoral, that her beauties cover up a million

entering murders; and that to the human demand for ethical values her answer is silence. Moreover, even could nature be held to be a copy of divine ideas, many modern readers could yet believe, with the Aristotelian æsthetic of classicism and the Renaissance, that art, embodying human concepts of perfection, can shape things actually nearer to their ideal than they ever occur in nature. But Ruskin had grown up in the old "natural religion," and he never shook it off, though he long survived Darwin's exposure of nature's ways. His books are probably the last great monument to the belief—which Butler, Paley, Wordsworth, Emerson, and the Bridgewater Treatises illustrate in various modes—that nature, being the copy of a divine archetype, is always right; that all her phenomena are intended by God to teach man something; hence, that she is full of symbols, providential adaptations, and natural causes, is analogous to morals and religion, exists for man's ethical discipline, and is a monitor and preceptress, ever lessening sin for his good. The worship of nature is with Ruskin literally a part of religion; and he feels that the whole duty of art is to praise God by recording nature's works with the utmost possible fidelity to their supposed ethical ends.

Ruskin's criticism of art thus treats almost exclusively the representation of natural objects—a representation unmodified except upon considerations moral or religious. In the place of æsthetic standards he unblushingly substitutes on the one hand religious or ethical standards, and on the other hand standards which may be called "physical." In accordance with the first, he looks to art for a didactic content, for assertions or statements as explicit as those of literature; commends this "literary" quality in pictures like Tintoretto's, whose real excellence lies elsewhere; and makes many excursions into the field of poetics and literary criticism: discussing at length, for example, that distinction which had exercised the romantic school of literary critics in the early 19th century—the distinction between *Imagination* and *Fancy*; discussing, again, in a celebrated passage, the "Pathetic Fallacy" of the poets, based as it is upon the assumption that men's moods have a sympathetic analogue and symbol in nature. Again, from Ruskin's assumption that nature is morally perfect arise his impatience of classical and Renaissance attempts to improve upon her by "idealization" or "generalization," and his inconsistent condemnation of Salvator Rosa and of the Dutch and Flemish realists because when they might have painted to edification, they chose to record "ugly" or "base" things.

In fact, ultimately even the religious and ethical standards fail to modify Ruskin's insistence upon representation; he uses them rather, as in the cases just noted, to confirm his preferences, glorifying as accordant with the divine scheme whatever art appeals to him, and denouncing whatever art does not as tainted with sin. Likewise, though in his theoretical analysis he allows a considerable place to "idealization" and "imagination"—once even speaking of "over-fidelity"—yet practically he is always minimizing their functions and explaining them away. It is with distinct relief, and with a certain unction and fervor, that he always returns to representation pure and

simple, detailed and loving and humble, which after all is his religion of art.

This ultimate triumph of the "physical" criterion has several interesting results. Engrossed in representation, Ruskin disregards or contemns abstract design and spatial pattern, and is almost insensible to Oriental art, which so largely depends upon these. Hence his later disparagement of Whistler and of "le Japonisme." Hence also his commendation of the Pre-Raphaelite movement, whose mediævalist revolt against the Renaissance, and whose love of detailed naturalistic representation ("foreground"), coincided with his own, but which he rather reinforced and championed than originated or even decisively influenced. Hence, finally, the net historical effect of 'Modern Painters' in making for sincerity and humility against the sentimentality, cockiness, prettiness, and *emphasis* of contemporary British art.

These evils, thought Ruskin, were traceable, as has been suggested, to the Post-Raphaelites of the Renaissance tradition, with their supposed tricks and insincerities and "rules of composition" and "practice of the schools." He must clear all that away, old masters and all—especially the Bolognese eclectics, and Claude, Poussin, and Hobbema—and establish in their place nature and Turner. The underlying assumptions of his method have been shown; its most important and most bulky actual product remains to be mentioned: the remarkable collection of observations of natural phenomena which Ruskin adduces to illustrate Turner's rich and various fidelity to nature. Large portions of the first, third, fourth, and fifth volumes, are given to description, in word and in picture, of nature's endless phases—the effects of wind and mist, the structure of rocks and the radiation of light, the organization and appearance of mountains, of clouds, of tree-trunks, boughs, and leaves, of waves and foam and reflections in water.

The reader who is interested in 'Modern Painters' for its place in Ruskin's life or for its own evolution in time as a piece of writing will of course read it as it was written; but if he approach it for pleasure he will be well advised to begin with the third volume. The first two volumes, to be sure, contain some of its most gorgeous passages—like the celebrated word-pictures of Aricia and of Turner's 'Slave-Ship.' Yet these, after all, are purple patches; and the body of the text is undistinguished, or distinguished chiefly by a crude parallel structure in couplets—a parallelism often both forced in thought and actually bungled in execution. Ruskin's early fondness for inordinately long sentences, again here, too often leads him to jumble into a single perfunctory period the material that should have formed a paragraph: instead of ordering it from sentence to sentence into separate articulated stages of thought, he pours it all volubly out into one heavy lump of a sentence loosely glued together by *and*, *but*, *for*, *only*, *as*, *so* and *so that*.

But in the 10 years between the publication of the second and the publication of the third and the fourth volumes Ruskin's style underwent a sobering and clarifying change. He had had much practice in writing—had meanwhile published 'Seven Lamps of Architecture' (1849), 'The Stones of Venice' (1851–53), 'Pre-Raphaelitism' (1851), and 'Lectures on

Architecture and Painting (1854); and his ideas having gained acceptance, he now spoke with more of authority and plainness, and less of the hot rhetoric of controversy. Here also he virtually abandoned the dreary scholasticism of the aesthetic system he had so aridly set forth in the second volume. The reader, then, who plunges in *medias res* is more likely to reach at once the heart of *Modern Painters*. He will feel at once the essential nobility of a book which, often wilful and mistaken, is never mean and is often tonic. He will realize it as the outcome of many years' disinterested study both of nature and of painting, as a wholehearted appreciation of Turner, who would be great upon any theory however arid, and as a valuable collection of natural facts and appearances, recorded by a loving observer, indefatigable students, and exquisite draughtsman, whose wilfulness vanishes when he is face to face with nature. Here lie its real strength and lasting value; it will probably stand as a great appreciation of a very great painter and, as a veritable treasury of things observed.

SAMUEL LEE WOLFF.

MODERN SCHOOLS OF DRAMA. See SCHOOLS OF DRAMA, MODERN.

MODERNISM, the designation applied to the advanced opinion of publicists and lecturers which in recent times were at variance with traditional orthodox doctrines. Official restraint was laid on them when Pope Pius X during his pontificate (1903-1914) enunciated the following doctrines in his famous encyclical *Pascendi gregis* issued in 1907. Dealing with the "modernist" movement and propaganda, and, speaking of it he laid down the following conditions and regulations, which he ordered Roman Catholics to follow. He said in part:

"In the first place, as regard to studies, we shall not ordain that scholastic philosophy be made the basis of the sacred sciences. It goes without saying that if anything is met with among the scholastic doctors which may be regarded as an excess of subtlety, or too carelessly stated; if there is anything which does not square with later discoveries, or which is altogether destitute of probability, we have no desire whatever to propose it for the imitation of present generations. And let it be clearly understood above all things that the scholastic philosophy we prescribe is that which the angelic doctor has bequeathed to us. . . . In the vast and varied abundance of studies opening before the mind desirous of truth, everybody knows how the old maxim describes theology as so far in front of all others that every science and art should serve it and be to it as handmaidens. . . . Anyone who in any way is found to be imbued with modernism is to be excluded without compunction from these offices, and those who already occupy them are to be removed. . . . Equal diligence and severity are to be used in examining and selecting candidates for holy orders. . . . It is also the duty of the bishops to prevent writings infected with modernism, or favorable to it, from being read when they have been published, and to hinder their publication when they have not. No book or paper or periodical of this kind must ever be permitted to seminarists or university students. . . . The Holy See neglects no means to put down

writings of this kind, but the number of them has now grown to such an extent that it is impossible to censure them all. . . . It is forbidden to secular priests, without the previous consent of the ordinary, to undertake the direction of papers or periodicals. . . . Let priests hold as sacred the authority of their prelates, let them take it for certain that the sacerdotal ministry, if not exercised under the guidance of the bishops, can never be either holy, or very fruitful or without blemish. . . . It is impossible to approve in Roman Catholic publications of a style inspired by unsound novelty which seems to deride the piety of the faithful and dwells on the introduction of a new order of Christian life."

R., *The Modernists Movement in the Roman Church: Its Origins and Outcome* (New York 1934); Burt, E., *Types of Religious Philosophy* (New York 1939).

MODESTO, mô-dês'tô, city, California, and Stanislaus County seat, altitude 90 feet, on the Tuolumne River, 80 miles southeast of Sacramento. It is served by the Southern Pacific and Tidewater Southern railroads and United Air Lines.

Modesto is primarily an agricultural community with several large canneries and a large refrigeration plant for processing frozen food. Meat, poultry, dairy products, olive oil, crates, chemicals, beer, wine, and paint are other industries employing from five to twenty persons.

The city was first settled in 1870, became the county seat in 1871, and was incorporated in 1884. It has a council-manager form of government. Pop. (1950) 17,389.

MODICA, mô-dê-kâ (ancient *Motvca*) commune, Italy, in Ragusa Province, Sicily, five miles south-southeast of Ragusa. It has a beautiful 17th century church, an ancient castle, a monastery with 15th century ruins of a church. Five miles east is the Cava d'Ispica, a noted limestone ravine with numerous grottoes, containing cave dwellings and early Christian tombs.

The area is chiefly agricultural. Important industries are olive oil, wine, cheese, macaroni and candy. Pop. (1936) 27,928.

MODJESKA, mô-jês'kâ. **Helena**, Polish actress: b. Kraków, Oct. 12, 1844; d. Bay City, Calif., April 8, 1909. Her father was a musician. In 1861 she married an impresario, Gustave S. Modrzejewski, and after playing some years on tour, she made her début at Kraków in 1865 and in Warsaw in 1868. Her husband died in 1868 and in September of that year she married Count Bozenta Chlapowski with whom she came to America in 1876. She had already become famous in her rendering of Shakespearean and other heroines of tragedy, and in 1877 she appeared at San Francisco, in *Adrienne Lecouvreur*, in which for the first time she acted in English. In Great Britain she made her particular success as Mary Stuart, Lady Macbeth, and La Dame aux Camélias.

Consult her autobiography (published after her death) *Memoirs and Impressions* (New York 1910).

MODJESKI, Ralph, Polish-American civil engineer: b. Kraków, Poland. Jan. 27, 1891; d. Los Angeles, Calif., June 26, 1940.

ame to the United States with his mother in 1876 and, for American naturalization, he changed his name to Modjeski, his mother being the celebrated tragedienne, Helena Modjeska. He was graduated at the College des Ponts et Chaussées, Paris, at the head of the class and with honors. He designed and built many bridges in the United States, the largest among them being the government bridge at Rock Island over the Mississippi; the Mississippi River bridge at Thebes, Ill.; the McKinley bridge at Saint Louis; the new Bismarck bridge over the Missouri; bridges over the Columbia River at Vancouver, Wash., and Celilo, Ore.; 160 bridges over the Willamette River at Portland, Ore. He also constructed two bridges over the Mississippi River,—one at Memphis, Tenn., and one at Keokuk, Iowa, and was consulting engineer on the design and construction of the Ohio River bridge at Metropolis, Ill., for the Chicago, Burlington and Quincy Railroad and of the Thames River bridge at New Haven, Conn., and the New York, New Haven and Hartford railroad. He was one of the three members of the commission on the Quebec bridge. He was chief engineer of the Delaware River Bridge, Philadelphia. He received an honorary degree of doctor of engineering at the University of Illinois in 1911; was a past director and member of the American Society of Civil Engineers; member of the British Institute of Civil Engineers and of the American Institute of Consulting Engineers; past president and member of the Western Society of Civil Engineers; member of the Franklin Institute and of the American Railway Engineering Association. He died at Los Angeles, Calif., 26 June 1940.

MODLING, mōd'ling, Austria, a town located at the foot of the Wienerwald, Lower Austria, to the south of Vienna, on the Mōdning stream, and junction of two railways. On account of the cool summers it is a favored summer resort and has three Catholic churches, among them the Early Gothic Saint-Othmar church, dating from 1454, with its Romanesque apse, a Protestant church, town-hall, city park with theatre and Kurhaus, a military academy, high school and Obergymnasium, agricultural school with curricula in brewing, horticulture, etc.; also an orphan asylum with its church, chalybeate baths, sanatorium, etc. Its chief industries are wine growing, manufactures of iron and metal wares, tubular boilers, fish and door works, varnish and lacquer works. Pop. 18,677.

MODOC (mō'dōk) **INDIANS**, a tribe of northern California, which in 1872, after firing on the United States forces, retreated to the neighboring lava beds, and there defended themselves desperately till June 1873, murdering two peace commissioners sent to them and killing or wounding 132 of the troops. Their chief, Kintupash, commonly known as Captain Jack, and three others, were hanged in October; about 100 who had not followed him were permitted to remain in California, the rest (145) were transferred to Indian Territory. The Modocs originally made their home on the shores of Lost River and Klamath Lake. They called themselves the *Maklaks*, or "the people." They were always a warlike tribe, and when fighting immigrants and settlers in the early days were warring with other tribes in their

neighborhood. Of the surviving Modocs, about 200 reside at the Klamath Reservation in Oregon.

MODULATION, in *music*, the act of moving through the sounds in the harmony of any particular key to those of another, or the transition from one key to another. The simplest form is the change from a given key to one nearly related to it, namely, its fifth (dominant), fourth (subdominant), its relative minor, or the relative minor of its fifth. Modulation into the dominant is effected by introducing in any of the parts (rarely in the bass, however) the sharp fourth, which becomes the seventh of the new key; thus, in the key of C, F would be sharpened to effect the transition into the key of G; to pass from that key into that of D it would be necessary to sharpen the C, and so on. In modulating into the subdominant the flat seventh is used, which becomes the fourth of the new key; thus, in passing from the key of C to that of F, the flat B is introduced, and from the key of F to that of B the E is flattened, and so on. The modulation into the relative minor is generally effected by employing the sharp fifth, which becomes the seventh or leading note of the new key; thus in changing from C to A minor the G should be sharpened. As almost every piece ends on the key in which it begins, a second modulation becomes necessary; this is effected by flattening the fifth of the new key if the first modulation is into the dominant and sharpening the fourth if in the subdominant. When a composer aims at a striking effect he may change from some given key to one quite unrelated, from C to E for instance; but such transitions should be sparingly employed. Modulation is generally resorted to in long compositions to please the ear with a fresh succession of chords. (See also *MODE*; *MUSIC*; *TEMPERAMENT*). Consult Groves, 'Dictionary of Music and Musicians' (Vol. III, pp. 232-240, New York 1910).

MODULE, from the Latin *modulus*, a small measure. A term used in architecture to designate an arbitrary unit of measurement on which to base the proportions of an order or the entire edifice. Architects have usually accepted either the diameter or half-diameter of a column at the base of a shaft as a unit or module for the order. This unit they divide into a graduated scale in minutes or parts according to individual selection. Vignola took a semi-diameter as his module and divided it into 12 parts for the Tuscan and Doric and into 18 for the other orders. Talladio, Cambria, Desgodetz, Le Clerc and others accepted a module in 30 divisions or minutes for all orders. Others have taken the entire height of the column and divided it into 20 parts for the Doric, 22½ for the Ionic, 25 for the Corinthian, and so on, one of which is taken for the module by which to regulate the other parts. Perrault's module was a third part of the diameter of shaft at base, to avoid a fraction. See *ORDERS OF ARCHITECTURE*.

MODULUS, in *mathematics*, a constant referring to properties of matter in certain equations. As stress is proportional to strain within the elastic limits, some constant quantity may be introduced, making this proportionality into an equality. In dealing with strength of mate-

rials, such a constant is called a modulus. Thus in Hooke's law, which says that extension, as of a bar, is proportional to the extending force, the constant which converts this proportionality into an equality is called the modulus of elasticity, or Young's modulus, and is denoted by *E*. Where the elastic limits are not exceeded, the transverse strain—the contraction per unit of transverse dimension—is from one third to one fourth the longitudinal strain. The symbol denoting the modulus of elasticity of bulk is *K*. It denotes the lessening of bulk per unit cube, usually per cubic inch, under hydrostatic stress. See also ELASTICITY; STRENGTH OF MATERIALS—*Laws of Elasticity*.

MOE, mō'ē, Jørgen Engebretsen, Norwegian poet: b. Hole, Ringerike, Norway, April 4, 1813; d. Kristiansand, March 27, 1882. Though a clergyman and eventually bishop of Kristiansand, he is best known for his collection of Norse folklore made in collaboration with Peter Christian Ashbjørnsen and published as *Norske folkeeventyr* (1842–1844; 1852; 1871). English translations of these tales were made by Sir George Dasent and others. Some of Moe's poems and children's stories have become Norwegian classics. His works other than the folk stories were published in a two-volume collection, *Samlede skrifter*, in 1877.

His son (INGEBRET) MOLTKE MOE (1859–1913) was also a folklorist, edited collections of folk songs and tales made by his father and Ashbjørnsen, and from 1899 was professor at Oslo University.

MOELLER, mül'ēr, Henry, American Roman Catholic prelate: b. Cincinnati, Ohio, Dec. 11, 1849; d. there, Jan. 5, 1925. His elementary studies were pursued at St. Joseph's parochial school and he afterward attended St. Francis Xavier's College. In 1869 he went to the American College at Rome, where he followed a seven years' course in philosophy and theology. He was ordained priest in the church of St. John Lateran, Rome, June 10, 1876, and after his return to Cincinnati was assigned to St. Patrick's Church, Bellfontaine, Ohio, and later appointed to a professorship in Mount St. Mary's Seminary, remaining there until 1879. In 1880 Archbishop William Henry Elder named him chancellor of the diocese of Cincinnati, and on Aug. 25, 1900, he was consecrated bishop of Columbus, Ohio. On April 27, 1903 the Holy See appointed him titular archbishop of Areopolis and coadjutor archbishop of Cincinnati with right of succession, and on the death of Archbishop Elder, Oct. 31, 1904, he assumed charge of the archdiocese, the pallium being conferred upon him by Cardinal Gibbons Feb. 15, 1905.

MOELLER, Louis Charles, American genre painter: b. New York, N. Y., Aug. 5, 1855; d. Weehawken, N. J., Nov. 11, 1930. He worked for three years with his father, a decorative painter, studied art at Cooper Institute and the National Academy of Design, New York, and in Munich, Germany, with Frank Duveneck. In 1883 he established his studio in New York. He received First Hallgarten Prize (1884), and was elected associate (1894) and member (1895) of the National Academy. He is represented at the Corcoran Gallery, Washington, D.C., by the painting *Disagreement*.

MOELLER VAN DEN BRUCK, mül'ē fān dēn brōōk', Arthur, German writer: b. Solingen, Germany, April 23, 1876; d. 1925. He edited the works of Edgar Allen Poe in German (1901–1904), and was coeditor with Dmitri Merezhkovsky of the first German edition of the work of Fyodor Mikhailovich Dostoyevsky (1906–1915). The Nazis took their name for Germany the Third Reich, from his book *Das Dritte Reich*.

MOERIS, Lake, mē'rīs, Egypt, an ancient artificial body of water which formerly lay north of El Faiyum, and was described by Herodotus as constructed entirely by human industry. It reported it to be 350 miles in circumference and more than 250 feet deep, and said that the fish was important and profitable. Moeris was connected by canal with the natural lake of Birke Qārūn and also by canal with the Nile. At the site of ancient Crocodilopolis (site of modern Faiyum), near the entrance to the latter canal two huge statues (mentioned by Herodotus) were unearthed late in the 19th century.

MOERITHERIUM, mē-rī-thē'rī-ūm, genus of primitive proboscidean mammals occurring in the Upper Eocene and early Oligocene of Egypt. Their remains have been found in the vicinity of ancient Lake Moeris. These mammals were about the size of tapirs and had a short proboscis and simple mastodont teeth. Late specializations led to the mastodons and elephants. See also ELEPHANT.

MOESIA, mē'shī-ā, a province of the ancient Roman Empire lying north of Thrace and Macedonia, extending to the Danube and the Black Sea, and corresponding in the main to modern Serbia and Bulgaria. Strabo described its original inhabitants as Thracians. The Romans first invaded it in 75 B.C., penetrating as far as the Danube, but it was not until 29 B.C., that it was finally subjugated.

MOFFAT, möff'ät, David Halliday, American capitalist: b. Washingtonville, N. Y., July 22, 1839; d. en route to New York, N. Y., March 18, 1911. He began work in 1854 as messenger for the New York Exchange Bank, and in 1858 went to Des Moines, Iowa, to join his brother. He worked for a year there as clerk in the bank of A. J. Stevens and Company, then became teller of the Bank of Nebraska at Omaha. After the bank closed in 1860, he joined a partner in operating a stationery and general store in Denver, Colo. The store also contained the post office and was the agency for the Western Union Telegraph Company. In 1861 Moffat returned East to marry his boyhood sweetheart Fannie J. Buckhout of Mechanicsville, N. Y., and with her made his permanent home in Denver. He became cashier of the First National Bank there in 1866 and later its president. He was closely identified with the development of Denver and with the mining and railroad interests of Colorado. He was president of the Denver and Rio Grande Railroad in 1884–1891, financed the building of the Florence and Cripple Creek line, and promoted building of the Denver, Northwestern and Pacific (later the Denver and Salt Lake), still known as "the Moffat road." He died while on a trip to New York to finance its building. Moffat Tunnel under James Peak in the Rockies is named for him.

MOFFAT, mǒf'āt, Robert, Scottish Congregationalist missionary to South Africa: b. Orington, Haddingtonshire, Dec. 21, 1795; d. Leigh, near Tunbridge Wells, Kent, Aug. 8, 1883. In early life a gardener, the London Missionary Society sent him in 1816 to Namaqualand, where he converted a local chief. At Capetown, in 1819, married Mary Smith, daughter of a former employer, who aided him in establishing a mission station at Kuruman, in Bechuanaland, in 1825. He visited England during 1839-1843, and returned there for good in 1870. Besides pursuing his work in Bechuanaland, he frequently journeyed northward to visit the Matabele and other tribes. He translated the Bible, many hymns, and *Lyman's Progress* into Sechuana, the language of the Bechuanas, and wrote the notable *Missionary Labours and Scenes in South Africa* (1842). One of his daughters married David Livingstone (v.). John S. Moffat, a son, published *The Lives of Robert and Mary Moffat* (1885).

MOFFATT, James, Scottish theologian: b. Glasgow, July 4, 1870; d. New York City, June 1, 1944. He was educated at Glasgow University, and from 1896 to 1912 he was a minister of the United Free Church of Scotland. During 1911-1915 he served as Yates professor of Greek Mansfield College, Oxford University, then returning to Glasgow to become professor of church history at the United Free Church College. In 1927 he relinquished this chair to go to the United States to assume the post of Washburn professor of church history at Union Theological Seminary, New York City. He made a notable translation of the Bible which bears his name. His numerous books include *Historical New Testament* (1901); *The Bible in Scots Literature* (1925); *Presbyterianism* (1928); *The Books of the Prophets* (1939).

MOFFETT, Cleveland Langston, American author and dramatist: b. Boonville, N. Y., April 27, 1863; d. Paris, Oct. 14, 1926. For many years he was a journalist in New York City, notably with the *New York Herald*, but in 1909 was a contributor to magazines. He published numerous books of adventure and some rose poems, among the latter being *A Vision of Christmas* (1917). The best of his plays were *Money Talks* (1906), *For Better or Worse* (1910), and *Greater Than the Law* (1912).

MOGADISCIO, mō-gā-dē'shō, East Africa, capital and chief seaport of Somalia (Italian Somaliland). Motor highways connect it with Kenya Colony, on the south, and Ethiopia, on the northwest. The town was captured by the Portuguese in the 16th century, and subsequently was held by the imams of Muscat. In the 19th century it became part of the domains of the sultanate of Zanzibar; and it was ceded to Italy in 1905. Pop. 55,000.

MOGADOR, mōg-ā-dōr', Morocco, most southern port on the Moroccan Atlantic coast, 30 miles west of Marrakech. It is known to the Moors as Suera, and to the Berbers as Tassart. There is a considerable Jewish population. The town is situated on a projecting cliff which is separated from the mainland by a region of dunes. Leather goods and copper utensils are made. Mogador was built during 1770-1776. Pop. 1946\ 32,000.

MOGILEV, mō-gē-lyōf', Soviet Union, city of the White Russian Soviet Socialist Republic, administrative center of a region of the same name, situated on both banks of the Dnepr (Dnieper) east of Minsk. The city is famous for its leather, bristles, and flint stone. Smelting is an important industry, and tobacco is manufactured. Mogilev was founded in the 13th century. At one time subject to the Poles, it was plundered by the Cossacks and the Swedes and several times was held by Russian forces prior to 1772, when it was annexed to Russia. Pop. (1939) 99,440.

MOGILEV PODOLSKI, mō-gē-lyōf' pō-dōl'yskē, Soviet Union, town of the Ukrainian Soviet Socialist Republic, on the left bank of the Dnestr (Dniester) southwest of Vinnitsa. There are flour mills and sugar refineries, and metal products are manufactured. In the Middle Ages, when it was an important center of the caravan trade, the town was inhabited largely by Moldavians, Armenians, and Greeks. Subsequently it was occupied by the Cossacks, Poles, and Turks, and was regarded as Polish territory in 1795, when it was annexed by Russia. Pop. 22,992.

MOGOLLON, mō-gō-yōn', MESA, the southern edge of the high plateau of Arizona, in the extreme south of Coconino County. The average altitude is some 8,000 feet. The mesa, which consists of limestone in part covered by lava, bears considerable pine forest.

MOGOLLON MOUNTAINS, a range in the southern part of Catron County, N. Mex., constituting the divide between the San Francisco and Gila rivers. It is over 30 miles long. The highest summits are Whitewater Baldy (10,892 feet), Mogollon Peak (10,778 feet), and Grouse Mountain (10,132 feet). The range consists of a thick succession of Tertiary volcanic rocks. Veins of silver and other ores are mined. It is largely forested, and has been included in Gila National Forest.

MOGUL, mō-gūl, or MUGHUL, mōō'gōōl, name applied to the dynasty of Mongol rulers of India. It was founded in 1526 by Babur (Babur, Bahar), a descendant of Tamerlane and Genghis Khan. Under his grandson, Akbar the Great, the Mogul empire embraced central and northern India, and much of Afghanistan. On the death of Aurangzeb in 1707 the empire declined; and Bahadur Shah II, last of the Mogul emperors, was deposed by the British in 1857.

MOHACS, mō'häch, Hungary, town on the right bank of the Danube, near the Yugoslav frontier and southeast of Pecs. It is the trading center of a rich agricultural region. Two noteworthy battles against the Turks were fought in the vicinity. In the first, Aug. 29, 1526, King Louis II was killed when the Hungarians were defeated by the forces of Sultan Suleiman I (or II), who captured most of Hungary. In the second, Aug. 12, 1687, Duke Charles of Lorraine won a bloody battle which hastened the end of Turkish rule over Hungary. Pop. 17,369.

MOHAIR, the commercial and technical name of the fleece of the Angora goat. The word comes to the English through the Old French *mohere*, from the Arabic *mukhayyar*, meaning mohair cloth. In color mohair is pure

white, except in rare cases, and grows in ringlets. The hairs composing a fleece are of varying lengths, but the average annual growth of the long hairs, which largely predominate, is about 10 inches. The hairs are not composed of epithelia, as is the case with wool, and therefore the felting property characteristic of wool is wanting. In fineness, mohair is variable with the individual animals, and is placed between the fine and coarse wools; in luster, durability, and strength it has no equal among fibers.

The only vitiating feature of mohair as it comes from the animal is the intermixture of an undercoat of lusterless, chalky white hairs; the hairs vary in length from one to three inches, and vary in total amount according to the breeding of the animal. This undercoat is known technically as "kemp," and the principal objection to it is that it does not take the fast dyes. It becomes necessary, therefore, to remove the kemp from the mohair used in the finest fabrics, and this work is done by a comb which, in removing the kemp, also takes out every mohair fiber of equal length or shorter than the kemp. This entails a loss ranging from 10 to 30 per cent, but the average loss lessens as better goats are developed.

The luster of mohair is very pronounced, and no amount of washing, dyeing, or other manipulation will dull it. Its durability is remarkable, and because of this fact it enters largely into goods of fine quality which are subjected to hard usage. Fast dyes have such an affinity for it that sunshine and storms have no effect on its brilliancy.

The uses of mohair are many. It is used in the manufacture of plush, and enters into such fabrics as alpaca, cashmere, and astrakhan. A high grade of mohair is derived from the goat ranches of Turkey, South Africa, and the southwestern United States.

MOHAIR GOAT, the Angora goat. See GOAT.

MOHAMMED. Mohammed was the founder of a religious system of belief, Islam (q.v.), which is now professed by some 300 million people scattered all over Asia, Africa, and southeastern Europe. Though born within the full light of history, his early life is but dimly known. The earliest record of it was not composed until over a century after his death and has not been preserved except in a recension, that of ibn-Hisham, who died two centuries after Mohammed. The exact date of Mohammed's birth is not certain; it must have fallen sometime between A.D. 570 and 580. Even of the name his mother gave him we cannot be positively sure. The one by which he is universally known, *Muhammad* (highly praised), sounds like an honorific one. Once in the Koran (61:6) it takes another form, *Ahmad* (more praiseworthy). His fellow citizens at times called him *al-Amin* (the trustworthy).

Early Career.—From casual references in the Koran, however, and from a critical study of the traditional material that has accumulated around the name of Mohammed, we can arrive at a number of reasonably certain facts in his career prior to the call to prophecy. His birthplace was Mecca, located in the words of the Koran (14:40) in "an uncultivable valley." The tribe to which he belonged was the Koreish (*Quraysh*), a noble tribe in charge of the sanctuary in that city and interested in caravan trade; but the immediate

family of the boy was humble. His father, Abdullah, died before his birth; his mother, Aminah, when he was about six years old. Tradition asserts that as an infant he was entrusted to the care of a Bedouin family in which he found a foster mother. The Koran has preserved a clear reference to Mohammed's lowly childhood: "Did He not find thee an orphan and protect thee?" etc. (93:6-8).

The fatherless and motherless boy found home with his parental grandfather, Abd-al-Muttalib, who died two years later leaving a son, abu Talib, in charge of his protégé. The story that at the age of 12 Mohammed accompanied his uncle to Syria with a trade caravan has been embellished with so many legends as to cast doubt on its veracity. Besides, no passage in the Koran suggests any familiarity on the part of Mohammed with Syria. One of those legends is that on his Syrian trip Mohammed met at Busra, south of Damascus, a Christian monk Bahira, who recognized in him the future great prophet and identified on his body certain significant signs, including the seal of the prophetic office between his shoulders.

His Call.—At the age of 25 Mohammed married a wealthy, energetic, and resolute widow of the Koreish, named Khadija, who was 15 years his senior. Before she became his wife the lady merchant was his employer. That the marriage proved successful may be inferred from the fact that only after her death in 620 did Mohammed practice polygamy and gradually increased the number of his wives to about a dozen. By Khadija he had the only child who survived, Fatima, who married his cousin Ali and became the mother of all those descended from the Prophet.

With the greater economic competence which came through his first marriage, Mohammed was now able to pursue his own tastes. He was then often seen in solitude, wandering on mountain paths and seeking opportunities for contemplation in out-of-the-way places and ravines. He must have been inoculated with certain effective ideas of Judaeo-Christian sources relating to God, man, and their interrelationship. Evidently he had been impressed by the fact he observed that the few Jews and Christians with whom he had come in contact had a "book" and were prosperous and advanced, whereas his own people, the heathen of Arabia, had no "book" and were backward.

It was supposedly in the course of one of these contemplative moods in a cave outside of Mecca, called Hira, that Mohammed one day heard a strange voice commanding: "Read in the name of thy Lord, who created." Puzzled, the unlettered Mohammed hesitated. But the assuring voice reiterated: "Read, for thy Lord is the most bounteous, who teacheth man that which he knew not" (96:1-5). Then and there the Prophet received his first call. The exact time of the occasion was later fixed toward the end of the fasting month of Ramadan, year 610. The night was named "the night of power" (97:1) and is still celebrated in Turkey and other parts of the Moslem world with deep reverence and special ritual. The voice which to Mohammed first sounded like the "reverberating of bells" was soon identified as that of Gabriel.

The Message.—The early utterances of Mohammed as a prophet took the form of rhymed prose, the type used by oracles, soothsayers, and pagan priests. The fact that he, an *ummi* (un-

schooling man), could produce such exquisite prose was adduced by him and his followers as the only proof of his prophethood. He performed no other miracles and claimed none. His first teachings revolved around the unity of God, his attributes, and future life. The doctrine of a judgment day involving reward for the righteous and punishment for the iniquitous was stressed as people failed to respond, and was used as an inducement or deterrent depending upon the nature of the response.

Early Followers.—His early followers, as to be expected from the nature of his message, largely came from the socially insignificant and economically discontent. On the higher level, the first to believe in him were his wife, Khadija, his cousin Ali (son of abu-Talib), and his future successor, abu-Bakr. All these were of the Koreish, but the bulk of the tribe were not only hesitant but actually hostile. That their hostility had economic motivation cannot be doubted. As custodians of the Kaaba, the pagan shrine and pilgrimage object, they could not afford to be indifferent to the inroads of a new faith.

About 615 some of the small band of Mohammed's followers fled the country to Christian Abyssinia (Ethiopia) because of persecution. Their choice of place of refuge shows that they looked upon Christianity as the religion most closely related to their own. A deputation sent by the Meccans to demand the extradition of the refugees returned empty handed. Meantime Mohammed and those who stayed with him were practically put under siege in a Meccan quarter with the expectation of being starved to submission. It was at this juncture that a revelation came acknowledging the genuineness of the three Meccan goddesses—together with Allah, who had hitherto been declared as the only one—and the siege was thereupon raised. The exiles returned, and Mohammed later withdrew the revelation as coming from the devil. The verses were expunged from the Koranic text.

The Hegira.—The truce between the Prophet and his aristocratic kinsmen was but a temporary one. After a brief sojourn in Taif (al-Tā'if), an oasis in the mountains southeast of Mecca, Mohammed sought a more secure abode in a farther place, Yathrib. Some citizens of this town had met Mohammed at a pilgrimage festival outside of Mecca and evidently encouraged him in the belief that Yathribites would be predisposed to receive him as a prophet because some of them were Jews, expecting the advent of such a leader. A number of Mohammed's followers preceded him to Yathrib, on July 16, 622. He himself, accompanied by abu-Bakr and Ali, followed, arriving there September 24, 622. Yathrib was hence called Medina (al-Madinah, the city [of the Prophet]). The migration was termed Hegira (*hijrah*). It constituted a turning point in the career of Mohammed, indeed in the history of Islam.

This date, July 16, 622, became the earliest fixed point in Moslem chronology, and was chosen as the starting point of the new calendar. According to this calendar the Moslem year is a lunar one, consisting of six months of 29 days each and six other months of 30 days each. This makes the entire year 354 days, with a discrepancy amounting to a little over three years in a century.

Medinese Period.—With the Hegira, the Medinese period in Mohammed's career begins.

In Medina he entered upon a period of success which made him more of a politician and less of a prophet. Here he contracted many marriages, some for political purposes, others with a view to having an heir, including one with the infant Aisha (A'ishah), daughter of abu-Bakr, and Hafsa, daughter of Umar. Gifted with ambition and astuteness, Aisha maintained her influence over her husband and priority over all other wives. Many of the traditions ascribed to him were transmitted through her.

Battle of Badr.—Mohammed felt the responsibility for providing sustenance for his followers from Mecca, now called Emigrants (*muhājirūn*), as well as for the new converts in Medina, termed Helpers (*ansār*). Under the pressure of this new necessity he considered it legitimate to intercept a Meccan caravan on its way back from Syria in 624, and that in Ramadan, a holy month in which fighting was prohibited. The battlefield was Badr, some 20 miles southwest of Medina. The Moslem army counted 300, the Meccan 1,000. Abu-Sufyan, head of the Koreishite aristocracy, led the Meccans. The outcome was a complete victory for the Prophet and, in the eyes of his followers, a divine sanction of his new creed. This victory of Badr laid the basis of the temporal power of Islam. Ever since then Islam has remained a militant polity.

The following year (625) at another encounter with the Meccans, at Uhud, abu-Sufyan won the day. The Prophet himself suffered a wound, but his prestige was not impaired. Two years later he successfully defended Medina, by digging a trench around it, against a more serious attack on the part of Meccans, Bedouins, and other confederates. This trench method of warfare, said to have been suggested by a Persian in Mohammed's camp, was an innovation the like of which the Arabians never saw before. His converts increased in direct proportion to his victories.

Mohammed hereafter felt secure in the leadership of Medina. Having failed in his attempt to secure alliance with the Jews of Medina, he turned against them and chased them from their plantations. Gradually he divorced his system from both Judaism and Christianity, and Arabized it. Thereby Islam's independence was asserted. Mohammed ordered his followers henceforth to turn their faces toward Mecca and not Jerusalem as before (2:139). The Kaaba, the cube-like sanctuary which housed the heathen idols in the city, became the new kiblāh (*qiblah*). Pilgrimage to Mecca was authorized, and so was the kissing of the Black Stone in the Kaaba. The religious laws governing fasting, almsgiving, and prayer were enjoined and incorporated in the Koran. Social and political ordinances relating to marriage, divorce, inheritance, and treatment of slaves and prisoners of war were likewise promulgated in this period.

The laws for the small Medinese congregation became the laws of Islam as a world religion and a world empire. From Medina the Islamic theocracy spread into the rest of Arabia, and thence into the rest of the world. The congregation was conceived of as a religious brotherhood: "The believers are naught else but brothers" (49:10). The extraordinary subsequent conquests of Moslem arms testify to the success the Arabian Prophet had in welding his unwieldy followers into a unified, devoted organization.

Mecca, Religious Capital.—In 628 Mohammed made a truce with his Meccan adversaries guaranteeing for his followers the right of performing the pilgrimage. Mecca thus became the religious capital, while Medina remained the political capital. In the course of the pilgrimage in the following year, Khalid ibn-al-Walid and Amr ibn-al-As, both of the Koreish and destined to play brilliant roles in the military career of Islam, were recruited to the new cause.

Early in 630 Mohammed found an excuse for attacking Mecca. He entered it as a conqueror, and with his own hands smashed the 360 idols in its sanctuary exclaiming: "Truth hath come and falsehood hath vanished." Scarcely was there another victor who exploited his victory with more restraint and moderation. Only ten of his old Meccan enemies were proscribed. It was about that time that Mohammed proclaimed the territory around the Kaaba *haram* (forbidden, sacred). The passage itself is not very clear: "O ye who believe! The idolaters are certainly unclean. So let them not come near the forbidden Mosque after this their year" (9:28). The early Moslems, however, put a generous interpretation on it, extended the forbidden area to include both Mecca and Medina with their environs, and considered even Christians and Jews as intended in the prohibition. Since then no non-Moslem could enter the sacred area and escape with his life. The few Christian-born Europeans who managed to do so professed Islam and practiced it while there.

Mohammed's Death.—On June 8, 632, Mohammed fell suddenly ill, and passed away complaining of a severe headache. He was buried where he died in the apartment of his favorite wife Aisha, later annexed to an adjoining mosque and made an object of pilgrimage to all future Moslem generations. The man, whose main strength lay in his unwavering belief that he was called in person by God to execute His will, had succeeded in establishing a religion, creating a nation, and laying the foundations of an empire. All members of his politico-religious community were to be brothers with no distinction among them except in their degree of piety (9:11; 49:13). Two years before his death he had dispatched an expedition against Syria which proved to be the first act in a struggle that did not cease until the empire of Islam had encompassed a large part of the then civilized world.

The traditional description of Mohammed makes him a man of medium height, with a large head, large eyes, heavy eyelashes, thick beard, broad shoulders, and hair neither straight nor curly. While his physical features may not be exactly known, his mental traits are clear. The impact of his personality, the trust he engendered in his followers, the enthusiasm he awakened in those with whom he came in contact, are all unmistakable. The devotion and loyalty of such unusually able men as abu-Bakr, Umar, and others indicate a strong character. Even at the height of his glory Mohammed lived a simple, unpretentious life. His behavior has been imitated by millions upon millions of men and women, in different places and times, who looked upon him as the perfect man.

Professor of Semitic Literature, Princeton University.

MOHAMMED, the name of six sultans of Turkey. **MOHAMMED I** (b. 1387; d. 1421), son of Bajazet I, succeeded Prince Musa in 1413. He extended Turkey's boundaries to the Danube, established friendly relations with Greece, and fostered literature, arts, and sciences. **MOHAMMED II** (b. Adrianople, 1430; d. 1481) succeeded his father, Murad II, in 1451. Styled "the conqueror" or "the Great," he captured Constantinople in 1453, making it his capital; conquered Serbia in 1456-1458; and took Scutari from the Venetians and Kaffa from the Genoese. He also acquired the Crimea, and in 1481 seized Otranto with a view to making war on Naples. **MOHAMMED III** (b. 1566; d. 1603) succeeded his father Murad III, in 1595, executing 19 brothers to assure himself the throne. In 1596 he captured Erlau, in Hungary, but his campaign against Abbas I, shah of Persia, proved unsuccessful. **MOHAMMED IV** (b. 1641; d. 1691) succeeded his father, Ibrahim, in 1648, the nominal regency of his grandmother soon being exchanged for actual control by the Kuprili (grand viziers). The Turks were defeated before Vienna in 1683, and subsequently met many reverses inflicted by a league of Poland, Russia, Venice, and Leopold I, Holy Roman emperor. Seized and imprisoned by the Turkish Army in 1687, he was succeeded by his brother, Suleiman II (or III), and languished in chains until his death. **MOHAMMED V** (b. Topkapu, Nov. 3, 1844; d. Yildiz, July 3, 1918). A son of Abdul-Medjid I, in 1909 he succeeded Abdul-Hamid II, his brother, who was deposed and exiled. Until placed on the throne at the age of 65, he had been held a state prisoner in close palace confinement. Poorly educated and ignorant of the world, he was a quiescent tool of the leaders of the Committee of Union and Progress. These men involved the country in World War I as ally of Germany, and he died as Turkish resistance was collapsing. **MOHAMMED VI** (b. Constantinople, Jan. 12, 1861; d. San Remo, Italy, May 16, 1926), brother of his three immediate predecessors, found the country exhausted from war when he succeeded in 1918. He opposed the reforms sought by the Turkish Nationalists led by Mustafa Kemal (later, Kemal Atatürk). The latter organized a provisional government, and after they defeated the Greeks in Asia Minor in 1922 they deposed Mohammed. He fled to Malta aboard a British battleship, and thence went into exile in Italy.

MOHAMMED AHMED, mōō-hām'mād ā'mād (called the *Mahdi*, mā'dē), Sudanese agitator: b. Dongola, 1843?; d. Omdurman, June 22, 1885. A leader of the Moslems in the Sudan, about 1880 he proclaimed himself the mahdi (guided one), the messiah who would free the people from their oppressors. At the head of thousands of his followers, he defeated an Egyptian army in Kordofan in 1882, and the next year, at Kashgil, an Anglo-Egyptian force led by Gen. William Hicks (Hicks Pasha), who was killed. In 1884 he routed another Anglo-Egyptian force commanded by Gen. Valentine Baker (Baker Pasha), and in 1885 he besieged and captured Khartoum, where Gen. Charles George Gordon was killed. He died five months later.

MOHAMMED ALI. See MEHEMET ALI.

MOHAMMED RIZA PAHLAVI, mō-hām'mād ri-zā' pā'lā-vē, shah of Iran (Persia): b. Oct. 29, 1919. He succeeded to the throne on Sept. 16, 1941, following the abdication of his father, Riza Shah Pahlavi. The early years of his reign were marked by continual unrest, due both to internal dissensions and the designs of rival great powers. In 1939 the shah married Princess Fawzieh, eldest sister of King Faruk I of Egypt; she bore him a daughter but no sons, and as a consequence he divorced her in 1949.

MOHAMMEDAN ART. The Mohammedan or Moslem culture, which from insignificant beginnings developed its military power with such extraordinary rapidity in the 7th century of our era, by subjugating nearly all western Asia, northern Africa, Spain, and later Sicily and Sardinia, was at the outset almost wholly destitute of art. It was the Arabs who led in these conquests; the Moors who overran Spain were largely of Arabic blood, and the Arabs were not at first artistically gifted. Like the Mongols and the Turks, who were later concerned in the advance of Islam (as the Moslems call their faith), the Arabs and Moors were at first wholly dependent on the peoples they conquered for their art, and especially for their architecture; upon the Syrians, Assyrians, Armenians, Persians, Byzantine Greeks, the Copts of Egypt, the Christians of North Africa, the Spaniards, and Sicilians, all of them Christians except the Persians. But the conquerors imposed upon their Christian and Persian builders and artists special programs and requirements due to their faith, and in the course of centuries developed predilections and aptitudes wholly their own, which gave to all their arts an Oriental character wholly unlike that of the Western arts from which they were derived. The name "Saracenic," frequently applied to all Moslem art, is an unscientific inheritance from the age of the Crusades.

The development of this art took place during the early Middle Ages, when European culture was slowly and painfully emerging from the chaos of the centuries following the fall of Rome. It produced a civilization and an art that flourished with extraordinary brilliance. Baghdad, Cairo, Cordoba, Granada, Toledo, Kairouan (Cyrene), and other cities of Arabia, Persia, Spain, and North Africa, were for some centuries more splendid than any European city outside of Constantinople (Istanbul). Moslem universities were great centers of learning; the Arabs cultivated mathematics and philosophy with enthusiasm; and the textile arts, ceramics, and metalwork were carried to so high a degree of perfection that they powerfully affected European art as late as the 16th century.

Historical Development.—During the first century after the Hegira (622–722 A.D.); the Arabs conquered Syria (634–642 A.D.); the Sassanian empire of Persia in 642; Armenia and Mesopotamia in 644, and part of northern Africa in 645–692. Sicily was occupied early in the 9th century. The Ommiad (Omayyad) dynasty of caliphs subdued the rest of North Africa during the 7th century and extended their conquest into Spain (710–713), where they established an independent Moorish emirate at Cordoba, as a rival to the Abbassid dynasty of Baghdad. The

9th and 10th centuries were a period of exceptional brilliancy in Moslem history: the age of Harun al-Rashid, of al-Mansur, of an almost fabulous splendor in Baghdad, of conquests in Sardinia and Malta, and of widespread architectural activity. During the 7th and 8th centuries the original mosque of Omar at Jerusalem (of which the present so-called "Mosque of Omar" is a much later successor), and that called El Aksah in the same city; the mosques of Amr at Cairo and of al-Walid at Damascus, and the Great Mosque at Cordoba had been built; during the 9th and 10th centuries the celebrated mosque at Kairouan, the mosques of ibn-Tūlūn and of al-Azhar at Cairo were built and that of Cordoba greatly enlarged. Under the Fatimid (Fatimite) dynasty, whose rule commenced in 969, there began the practice of erecting domes over tombs and sepulchral chambers, and the earliest minaret was built in Cairo. But the greatest architectural activity in that city occurred under the Ayyubid (Ayubite) dynasty, of the 12th and 13th centuries, and the Mameluke sultans, who followed. To this period belong the splendid mosques of Kalaūn (1284), Hassan. (1356–1379), Barkūk (1384), Muayyad (1415) and Kaīt Bey (1465), and the remarkable group of domed and minareted tombs of the Karafah quarter, commonly known as the tombs of the Khalifs and of the Mamelukes.

The culmination of Hispano-Moresque architecture came somewhat earlier—singularly enough during the period of the disintegration of the Moorish power in Spain. The famous Giralda tower at Seville (1160), the Alcazars or castle-palaces of Seville and Malaga (1181–1310), and the Alhambra at Granada (1248–1306) are the most noted extant products of this age.

Although Persia was so early subdued by the Arabs, and by the artistic proclivities of the people became the parent of Mohammedan art in Baghdad and Mesopotamia, and later in Turkestan, nearly all the early monuments of Persian architecture were destroyed in the Mongol invasions of the 11th–13th centuries. The recovery in architecture was slow until the accession of the Safawid (Safavid) dynasty at the close of the 15th century, when there ensued a remarkable revival of all the arts in the Persian cities, with the building of great mosques, bazaars, caravan-series, and bridges, and with a great development of decorative art in rugs, printed fabrics, ceramics, and manuscript-illumination.

The conquest of the Indian states by the Moslems was late, gradual, and incomplete, and neither the Hindu religion nor the native Hindu art was ever extinguished, even in those regions longest subject to Islam. Northern India was conquered in part in 1192, and developed a style in which Persian and Hindu forms are inseparably blended, as in old Delhi and Ajmer. In other areas of India, during the next three centuries Mohammedan mosques and palaces were built in various local styles; but it was the Mogul emperors who, in India as in Persia, developed the arts, including architecture, with the greatest splendor, especially in the magnificent mosques, palaces, and tombs of Bijapur, Allahabad, Secunderabad, Delhi, and Agra, and their suburbs. In this period Persian conceptions and influences are dominant, but the Hindu traditions are also plainly manifest.

Turkey was the latest of the Moslem empires to develop a characteristic art. The

Seljuk Turks who had settled in Asia Minor in the 11th century, and had built up a notable capital at Iconium (Konya) under the influence of Persian art, were superseded by the Ottoman Turks in 1299 under Osman, the founder of the dynasty. By the capture of Constantinople in 1453 (having captured Adrianople nearly a century earlier), the Turks became masters of the Byzantine Empire. The resulting development in the arts shows a mingling of Arabic, Persian, and Byzantine elements, the latter predominating in the architecture of the mosques.

In China, the Moslem element has been too feeble to produce any vital and characteristic Mohammedan art.

General Characteristics.—While in Mohammedan art five distinct style developments are easily recognized—the Arabic, Moorish, Persian, Indo-Moslem, and Turkish—certain common characteristics run through them all, due in part to the religion, in part to the Asiatic source of all the Moslem peoples. The Koran forbids all representation of living beings, and sculpture in all its forms is rigidly proscribed, while pictorial art, and even the use of pure nature forms in ornament, are equally rejected except by the Persians, who belong to the Shi'ite sect, and by the Moslems of India. Everywhere else decorative art has been restricted to purely conventional motives, or to nature forms so conventionalized as to be hardly recognizable. In spite of this restriction, it is in the arts of decoration that the Moslems have always been the strongest. In these arts the Asiatic love of color and of surface ornament is everywhere evident, in contrast to the European predilection for plastic decoration based on structure. In all Moslem styles minuteness of detail and intricacy of composition are preferred to the clarity and repose of the European styles, and brilliant color, broken up into minute elements and covering broad surfaces, is preferred to those effects of light and shade produced by sculpture and carving in varied relief. In the wall decoration of the architecture the traditions of rug design seem to dominate. Common to all the architectural styles are certain motives; the interlaced star ("star of Solomon"), the honeycomb or stalactite motive, and decorative inscriptions in the Cufic, Persian, or Arabic forms of lettering. Arches, of whatever form, are almost invariably enclosed in rectangular panels or decorative frames.

Architectural Styles and Monuments.—As Gothic architecture received form in the building of cathedrals, so the Moslems developed theirs in the building of mosques. A mosque is primarily a prayer hall, the ceremonial prayer of adoration of Allah being the chief element in the Islamic worship. And since all prayer must be made toward Mecca, the holy city, the one prime essential of the mosque is the *mihrab* or niche in the side of the hall toward Mecca, indicating the *kiblah* or ritual direction of worship. To the right of this, in the *jami* (principal) mosques, is a *mimbar* (high narrow pulpit) from which the Koran is read on Fridays. There is usually in front of the mosque an open court surrounded by arcades, entered by one or more lofty gates, and having in the center a fountain for the ceremonial ablutions without which the worshiper is deemed unfit for prayer. To nearly all mosques are attached one or more minarets, from whose exterior galleries the *muezzin* chants daily at the appointed hours the far-sounding call to

prayer. These requirements permit of the utmost variety in plans and detailed arrangements, which differ widely in the five principal styles.

Of these five styles, the *Arabic* has less unity than any of the others. It may, indeed, be divided into three substyles: the Syrian, based upon the Syrian-Byzantine architecture and later influenced by the Romanesque works of the Crusaders; the Mesopotamian, dominated by Persian influence, as at Baghdad; and the Egypto-Arabic or Cairene, springing from Coptic prototypes, and by far the most distinctive of the three. It is characterized by the pointed arch, the ovoid or pointed dome decorated in relief, with or without a drum; minarets square below, with two or more diminishing stages and much surface ornament; the use of stalactite corbeling, of marble veneering internally, and of carved and painted beamed ceilings. The buildings are seldom large in scale, even when covering large areas; height and spaciousness are not sought after, as a rule. The material of construction is usually brick, faced externally with stone or with stucco. The entrance doorway is made impressive by setting it in a deep and lofty niche. Vaulting is chiefly confined to the domes over sepulchral chambers, a feature introduced in the Fatimid period from Mesopotamia, whence also came the minaret. The early mosques in Cairo, as generally elsewhere also, consisted of a court surrounded by arcades, and the prayer hall was simply a multiplication of these arcades on the side toward Mecca. But the Hassan mosque (1356) is exceptional in its prayer hall covered by a huge barrel vault of 70 feet span; and the "Mosque of Omar" at Jerusalem, in its concentric circular plan and vast wooden dome. Later it became customary to incorporate in the mosque not only one or more sepulchral chambers, but also hospitals, and rooms for priests and for schools and other purposes. After the Turkish conquest by Selim I in 1517, mosques were sometimes erected in Cairo after the Constantinople type, with broad domes over the prayer hall (Boulak, 1520; Mehemet Ali, 1821). The Arab houses of Cairo, built on the street, are noted for their fronts of *moucharaby* latticework. Woodwork of intricate star-paneling inlaid with mother-of-pearl and ivory appears in doors and *mimbars*, and decorative tilework is freely used in interiors—an art imported from Persia.

The *Moorish* style, of which the Hispano-Moresque is simply the Spanish development, employs the horseshoe arch, often cusped; slender columns with carved capitals, often of cubical form, above a high necking; massive square towers for minarets, and a system of wall decoration in stucco, stamped or molded in intricate surface patterns, brilliantly colored, above a wainscot of colored tiles. Domes and vaults are rare. Both stone and brick are used in construction, and external patterning in relief is a frequent feature of external brickwork, as on the Giralda at Seville. Both in Africa and Spain the decorative element predominates over the structural. The most noted monuments have been mentioned; others at Fez, Tangiers, Algiers, Tlemcen, both mosques and palaces, are of interest.

The *Persian* monuments differ in style from the Arabic and Moorish, alike in plan, construction, form, and decoration. The bulbous dome, the round minaret with a roofed gallery and bulbous top, the four-centered pointed arch, portal niches of huge size, and the veneering of the

bove Graceful human figures and delicate naturalistic details decorate this tile wall panel, probably from palace built by Shah Abbas I between 1600 and 529 in Isfahan, Persia.

MOHAMMEDAN ART

ight In Isfahan, Iran, is this prayer niche (1354) covered with a colorful mosaic of brightly glazed earthenware set in plaster.

in Metropolitan Museum of Art, New York

How From Persia under the Umayyad dynasty comes its 8th century bronze ewer.

Above right: Syrian mosque lamp of enameled glass made between 1300 and 1350.

Left: Panel of wall tiles in a glazed faience, from the first half of the 17th century.

(Above right and left) The Metropolitan Museum of Art, New York, Ewing Galloway

Below: This tughra, or calligraphic emblem much in the nature of a monogram, was used as an official signature by Suleiman the Magnificent of Turkey (r. 1520-1566).

whole exterior with figured tiles in brilliant colors, give the Persian mosques an aspect nowhere else encountered. Brick is the universal material of construction, and vaulting of great intricacy is everywhere used, alike in mosques and in secular buildings. In palaces, wooden posts and wooden ceilings are common, brilliantly painted; but otherwise columns are infrequent. The principal mosques belong to the Safawid period, though the ruined mosque at Tabriz and the tomb of Khodabende at Sultaniye are of the early 14th century. The great square (Maidan), the mosque and college, and the Palace of the Mirrors, all at Isfahan, the caravansary at Aminabad, and bazaars, bridges, and mosques at Shiraz and Hamadan, are notable examples of the style, to which may also be credited the fine though ruined mosques at Bukhara and Samarkand.

The various pre-Mogul *Indian* styles show a mixture of Hindu and Persian forms (for example, the mosque, gate, and tomb of Altamsh at Delhi, mosques at Ajmer, Ahmedabad, and Anjarat). The Mogul conquest introduced an entirely new architecture, Persian as to its forms, which include the bulbous dome, round minaret, great niche portals, and the four-centered arch. But it is an architecture of sandstone and marble, not of brick and tile, and is superior to the Persian in the scale, dignity, and setting of its monuments. Among the most important of these are the mosques at Bijapur, Agra (Muti Masjid or Pearl Mosque), Delhi (Jumma Masjid), and Fatehpur Sikri; the great palace groups at Delhi and Fatehpur Sikri; the tombs of Akbar at Sikandra and of Humayun at Agra, and the incomparable Taj Mahal near Agra (the tomb of Shah Jahan and of his favorite wife, Mumtaz Mahal).

The earliest *Turkish* architecture, the Seljukian, was an offshoot of the Persian. When the Ottoman Turks established their new capital at Bursa (1300), they employed at first the Seljuk style, as in the "Green Mosque"; but after the capture of Constantinople in 1453 the Byzantine influence became paramount in the plan and construction of mosques, while the details betray mingled Arab and Persian origins. Of all the Mohammedan styles this is the most purely structural in masses and conception, and the most imposing in scale. The great mosques follow the prototype of Santa Sophia (q.v.), covering vast interiors with a lofty central dome and a combination of half domes and cupolas; the minarets are round, with one or more galleries and a slender lead-covered spire. The Turks employ the simple pointed arch with alternating voussoirs of light and dark marble, enclosed in a rectangular panel; marble columns with stalactite capitals; stalactite corbeling and cornices, and a combination of tiles and painted ornament for interior decoration. All their finest buildings are of white marble; they include the Mosque of Mohammed II (1460), the Mosque of Sultan Suleiman and tombs and the Shah Zade Mosque (1556), the Valide and Ahmed I mosques (17th century) and the Nouri Osmaniye (1756), all at Constantinople, and the Mosque of Selim II, at Adrianople. Many fountains, and several palaces built in the 19th century are of a showy but inferior type.

The Decorative Arts.—The Asiatic races have always excelled in surface decoration, especially in the use of color. Among them the Moslem nations have displayed great skill, not

only in the application of surface decoration to buildings but also in many forms of textile and ceramic art, and in certain kinds of woodwork and metalwork and even stained glass. In textiles, the place of honor belongs to the rug weavers of Turkey, Persia, and India, whose art in this field is descended from very ancient times when Babylonia led the world in decorative weaving. The Turkish rugs, including those from Mesopotamia and Turkestan, are distinguished by their purely conventional patterns, composed almost entirely of rectilinear and angular motives. The Persian and Indian rugs are esteemed the finest; in these the patterns are in flowing lines, with liberal use of leaf and floral forms seminaturalistic in treatment. The Persians also produce remarkable hangings printed in colors by hand from engraved wooden blocks on cotton or linen. Both India and Turkey have produced remarkable needlework in colored silk on broadcloth or cotton; but this art has nearly disappeared in Turkey. The Armenian and Syrian laces are of great beauty, but they are mostly the work of Christians, not Moslems. In *ceramics*, the Persians have been from a remote antiquity the leaders among the Moslem nations. They inherited the art from the ancient Babylonians, and in turn taught it to the Arabs of Egypt and the Moors of Spain, and later to the Turks of Asia Minor. (See CERAMICS). Their use of patterned tiles for veneering the exteriors of their buildings has been already mentioned. In all the Persian ceramics, both tiles and glazed pottery, floral patterns are freely used; the cypress tree, the rose, carnation or pink, peony, and other flowers appearing frequently, as well as birds, gazelles, and other animals. The Arabs and Moors, on the other hand, avoided, as far as possible, such naturalistic representations. The Turkish tiles and pottery approach more nearly the Persian types. In *metalwork*, the Moslems of India excel, especially in chased and perforated brass vessels, and in niello work—the incrusting of patterns in gold or silver in or upon iron or bronze; but it is not possible to distinguish the Moslem from the Hindu handiwork, except where the chasing or incrusting of Hindu emblems betrays its non-Moslem origin. The kindred art of damascening, or the insertion of gold, silver, or brass wire into grooves cut in iron or steel, originated, as its name implies, in Damascus; it was carried to great perfection by the Arabs, especially in the decoration of armor and weapons. The *woodwork* of doors and of *mimbars* (pulpits) in Cairo and in Turkey and the *moucharaby* of houses in Cairo have been previously mentioned. A similar treatment of intricately framed paneling and of spindle lattice-work is employed for both fixed and movable furniture. The Moslems of India also excel in perforated and carved woodwork for interior decoration. The art of *stained glass* was developed in Cairo, perhaps as early as the 14th century, and spread thence to Turkey in the 16th. The patterns are perforated in cement, and the perforations stopped with bits of colored glass, combined in harmonies of line and color.

In some respects the decoration of manuscripts is the most distinctive of all the Moslem arts, and it is hard to decide which nation produced the finest works, though the palm would perhaps go to the Persians. The beauty of the Arabic lettering (of which the Turkish and Persian characters are mere variants) lends itself

to decorative calligraphy in an eminent degree, while each of these nations has developed an art of supplementary adornments in color and gold, in borders, decorative panels, and other forms of ornament, that rival the finest manuscripts of western Europe. To these embellishments the artists of Persia and India add the resource of pictorial illustration in color, which the Arab and Turkish illuminators allow only in the rarest instances.

The decorative arts of Islam generally reached their highest attainment in the 15th-17th centuries, since when there has been a long and slow decline, though they are still practiced with success in many parts of Turkey, Egypt, Persia, and India.

Bibliography.—For the general subject the most important work is Saladin et Migeon, *Manuel d'art musulman* (Paris 1907); also Franz Pascha, J., *Die Baukunst des Islam* (Darmstadt 1887).

A. D. F. HAMLIN.

MOHAMMEDAN LITERATURE. The study of the traditions of Mohammed, in all their extended ramifications, comprises what might be termed Mohammedan literature; and as these are pre-eminently embodied in the Koran, that work, without striking literary art and mechanically constructed, became the incomparable classic of Islam, to give rise to schools of thought and to systems of theology and jurisprudence, and to promote distinct branches of history, biography, criticism, science, grammar, philosophy, legend, and poetry. It is curious how such a book, revealed in bits and scraps, arranged according to the length of the chapters, without uniform style, and whose text was not collated in the Prophet's lifetime, should have been worshiped and idealized. But our Western mind cannot understand the Oriental point of view, and least of all the windings and complexities of the Semitic brain. Othman, third caliph of the Moslems, had done away in 651-652 with all existing copies of the Koran except that of Abu Bekr, which itself was shortly afterward destroyed by Marwan, governor of Medina. All copies of the book in current use, wherever scattered, are reproductions of Abu Bekr's edition. Uniformity and authoritative text could apparently be secured in no other way. Out of the exegesis of the Koran sprang the most vital and varied elements in Arabic literary history, which began in primitive pre-Islamic times in the ceaseless caravan marches across the deserts, where the camel's regular swing taught the Arab to sing rhymes. The more cultured Moslem of a later age is a city dweller, and shares wider aspirations; but the Koran, not the desert, is still his starting point, to which he always returns, whether

he follows the simple monotheism of Mohammed or an agnostic mysticism.

It can readily be seen how history among the Arabs began with the *Maghazi*—books devoted to the study of Mohammed's wars. The deeds of that era were to be narrated, the chronicles and legends gathered, at second hand generally. Efforts to obtain information as to the Prophet's life gave birth to biography, which was to develop in later centuries. Parallel with histories of wars and events were written histories of famous cities, like Medina or Mecca, Baghdad and others, most of which works have perished. How this field was cultivated can be shown from what is recorded of al-Tabari, the most illustrious historian (838-923), who for 40 years wrote 40 sheets a day. The oldest biography extant is that of the Prophet by Ibn Ishaq (d. 767). The beginnings of the historical romances go back to the first centuries of Islam, when veneration for Mohammed gave rise to legend and fable that passed as genuine history.

The literature of jurisprudence sprang naturally from the study of the *hadith* (body of traditions). The Koran had to be supplemented at an early date to provide laws for the Moslem world. The sayings of the Prophet after his death, his usages and decisions, had to be collected, arranged, and sifted. The Koran itself was absolute authority, if it contained a law applicable to the case in hand; otherwise the memories of the *Sayids*, the companions of the Prophet, were resorted to for his rulings. If these proved of no avail, recourse was had to the common law of Medina, and finally to the common sense of the judge. Hence a vast legal literature arose—collections of traditions, called *Musnads*, because each tradition was "supported" against the companion from whom it came. One of the first and greatest of these was the *Musnad* of Ahmad ibn-Hanbal (780-855), a collection of about 28,000 traditions.

Another type of book of traditions was the *Musannaf* or "arranged,"—chapters classified according to their subject matter. Al-Bukhari (810-870) made the most respected of all the collections, termed *Sahih* ("sincere book"), which is so arranged as to form bases for a complete system of jurisprudence. Another is that of Muslim ibn al-Hajjaj (d. 883). These were the two most honored authorities. Four other legal collections, *Sunan* ("usages"), stand second to the two *Sahihs*. Different writers, however, give the number of canonical works as five, seven, or even 10. It did not take long before the six great books were themselves abridged and explained—the rules of the faith were summed up into a selection of 40 traditions, and these became the subject of endless commentaries. The Roman as well as the Rabbinical law had marked influence on Moslem law. Four schools of thought held sway that of Abu-Hanifah (699-767), speculative jurist; of Malik ibn-Anas (715?-795), historical jurist; of al-Shafi'i (767-820), reverent and conciliatory; and that of the pupils of Ahmad ibn-Hanbal, reactionary. A fifth school, the *Zahirite*, whose discovery is due to Ignaz Goldziher, founded by the Abu Sulaiman David ibn Ali (815-883) insisted on the external meaning of the Koran and the traditions, and repudiated further tradition. "It never held rank," writes Duncan Black Macdonald, "as an acknowledged school of Mohammedan law."

With the deeper study of the Koran, two fur-

ther branches arose—the science of reading the text and that of its interpretation. Oral tradition, which was at first depended upon, was soon followed by written tradition, and books were compiled on the various ways of reading, some of which, dating from the 10th century, are preserved at Berlin, Algiers, and Leiden. One book, written by a grave jurist, and entitled *Kitab Muḥbarak* (Blessed Book) is a story of those who died listening to the reading of the Koran. In the line of exegesis, the array of books is overwhelming, the mystical comprising a large number. Hence arose the increased study of grammar, most of the commentators being grammarians.

In the department of theology, whole libraries have been written. Ghazali, one of the famous masters (1058–1111), wrote 69 works that are extant. Like its jurisprudence, Moslem theology could not begin until after the Prophet's death. At first it was more political than religious, but soon settled down to more or less logical wrangling between sect and sect. Christian, Jew, Persian, Greek alike had their influence, with developments now rational, now mystical, now radical, now pantheistic, giving birth to countless works, some of which are almost modern in their suggestions and implications. They prove the fertility and the intensity of the Moslem intellect, and what marvelous power existed in the Prophet to have supplied thought for so many ages and to so many minds.

Bibliography.—The best recent books which can be recommended are Huart, Clement, *A History of Arabic Literature* (New York 1903); Macdonald, Duncan B., *Development of Muslim Theology, Jurisprudence and Constitutional Theory* (New York 1903).

ABRAHAM S. ISAACS.

MOHAMMEDAN SECTS, the numerous schisms and schools of thought which arose in Islam. See **MUSLEM SECTS**.

MOHAMMEDANISM, a system of belief founded by Mohammed, the Arabian prophet. See **ISLAM**.

MOHAMMERAH, mō-hām'ēr-ā, Iran, port at the confluence of the Karun and the Shatt al Arab, capital of Khuzistan Province. It is known also as **KHORRAMSHAHR**. Although the Shatt al Arab is within Iraqi territory, the Iranians have freedom of navigation as far as Mohammerah and neighboring Abadan by virtue of a treaty concluded with Turkey in 1847. Pop. 30,000.

MOHAVE, mō-hā'vā, **DESERT**. See **MOJAVE DESERT**.

MOHAVE INDIANS. See **MOJAVE INDIANS**.

MOHAWK, mō'hōk, a river whose headwaters rise in Mohawk Hill, in the southern part of Lewis County, N. Y. It flows south to Rome, where, east by south, with many curves, it continues to the Hudson River, which it enters at Cohoes, nine miles above Albany. It is about 175 miles long, and is the largest tributary of the Hudson. In several places along the route there are rapids and falls, as at Little Falls in Herkimer County, Oriskany in Oneida County, all of which are noted for manufacturing. The falls of the Mohawk River (Cohoes Falls) 70 feet high

are near Cohoes, where in a glacial pothole the complete skeleton of a mastodon was discovered in 1883. The bed of the Mohawk River was once much wider than the present channel through which the water passes; in some places the distances between the old banks are from a mile to nearly three miles. The Mohawk Valley is noted for its beauty and the fertility of its soil. The Barge Canal (q.v.) of New York State is parallel with the river to Rome. Two railroads also parallel the river to Rome, the New York Central and the West Shore. The manufacturing industries of the valley, which depend largely for motive power upon the water power of the Mohawk, are extensive. A number of pretty villages and thriving manufacturing towns are on its banks, chief of which from west to east are Rome and Utica in Oneida County; Ilion, Herkimer, and Little Falls in Herkimer County; Fort Plain, Canajoharie, Fonda, and Amsterdam in Montgomery County; Schenectady in Schenectady County; and Mechanicville in Saratoga County.

In the "settlement period" of the United States, this valley was the main highway from the "east colonies" to the Great Lakes. It was the home of the most warlike tribes of Indians, the headquarters of the Five Nations. The first missionaries and the first explorers who left the Hudson River in this part of the United States journeyed along the country through which flowed the Mohawk. In this valley, near the Mohawk, René Goupil was killed by the Indians, and later Isaac Jogues was martyred at the place now called Auriesville, on the south side of the river a little east of Fonda. Sir William Johnson built two homes in this valley, one at Fort Johnson about one mile west of Amsterdam (now the railroad station of Akin), the other, Johnson Hall, near the present Johnstown, in Fulton County. Much of the early history of the river and valley as related to the whites is connected with the rule of Sir William Johnson and his power over the Five Nations. The center of wealth and power in the valley before the American Revolution was at Johnson's home. At the breaking out of the Revolutionary War, an effort was made by both parties to hold possession of the Mohawk. The death of Sir William Johnson, just at the beginning of the war, removed a strong power from the council. His sons and their friends lacked his humanity and wisdom. The union between the British and the Indians resulted in many terrible scenes, among others the massacres of Cherry Creek and Schoharie, the burning of homes, and the taking of many lives in the valley. Gen. John Burgoyne realized the value of having possession of this valley, and some of the important battles of the revolution took place along the Mohawk. There were many Tories in the valley; but a large number of the settlers were always patriots. When the news of Concord and Lexington reached the inhabitants along the Mohawk, many of them loaded into wagons all the grain they could spare and sent the precious cargoes over the rough roads to Boston. When the British determined to end the war the Mohawk Valley, the gateway to the West, was the site chosen. Here the Tories outnumbered the patriots, and the Indians were the allies of the British; but Barry Saint Leger's defeat at Oriskany by men under Nicholas Herkimer filled Burgoyne with despair, and fired the enthusiasm and enlivened the hope of the patriots.

MOHAWK INDIANS, a tribe of North American Indians, the easternmost of the Six Nations, named collectively by the French, the Iroquois. According to their own tradition, confirmed by those of other tribes, they were the eldest people in the confederacy of the Six Nations and styled themselves Kaniengehaga, "people of the place of the flint." They believed that they were liberated from subterranean confinement by Tareya-wagon, who guided them into the valley of the Mohawk; thence they passed to the Hudson and to the sea. The valley in which they at first established themselves was the seat of their power from the discovery of the country until the American Revolution. Their dominion extended from Lake Champlain to the headwaters of the Susquehanna and the Delaware. A warlike tribe, they inflicted great tortures on their prisoners and practiced cannibalism. With the introduction of firearms by Dutch traders they became renowned above all the other nations for their skill as warriors, and carried terror wherever they went. Their forays extended as far as the Connecticut River, and their influence prevailed among the small independent tribes about the region of the present city of New York. During the French and Indian War they supported Sir William Johnson, following him in his most perilous expeditions and aiding him in the contests of Lake George and Niagara. After his death they transferred their attachment to his family, and were forced to flee from their ancestral home to Canada; lands were assigned them on the Grand River and on the Bay of Quinté, near the east end of Lake Ontario, where over 1,200 still reside. See IROQUOIS LEAGUE; SIX NATIONS.

MOHAWKITE. An arsenical ore of copper with minor amounts of nickel and cobalt, a variety of domeykite. Occurs in Mohawk copper mines, Houghton County, Mich.

MOHEGAN, mô-hë'gân, **INDIANS**, a tribe of North American Indians of the Algonquian (Mahican) family, who formerly lived on the Thames River in eastern Connecticut. They were at one time united with the Pequots and after the death of Sassacus, the Pequot leader, the remainder of the tribe came to the camp of the Mohegan chief. After the death of King Philip (Metacomet) in 1676, the Mohegan tribe was the only important one in that region.

The Mohegan seem to have been the eastern branch of that group of closely connected tribes that spread to the farther side of the Hudson River. As the white settlements extended the Mohegan sold most of their lands and confined themselves to a reservation on the Thames River in New London County, Conn. Their village, also called Mohegan, was on the site of the present town of that name. They rapidly dwindled away when surrounded by the whites. Many joined the Scaticook but in 1788 a still larger number, under the leadership of Occom, joined the Brotherton Indians in New York. The rest of the tribe continued to reside in the vicinity of Mohegan or Norwich, Conn.

MOHILEV. See MOGILEV.

MOHL, möl, **Hugo von**, German botanist: b. Stuttgart, April 8, 1805; d. Tübingen, April 1, 1872. He studied at the universities of Tübingen

and Munich, and from 1832 he held the professorship of botany at Tübingen. His researches into the physiology of higher plant forms was of major importance. He suggested use of the term protoplasm to indicate the substance of the cell body, and may be considered the founder of the cell theory. His *Die Vegetabilische Zelle* (1851) was translated into English by H. Hentfrey under the title *Principles of the Anatomy and Physiology of the Vegetable Cell* (1852). *Vermischte Schriften botanischen Inhalts* (1845) was a collection of his most important papers. He was the brother of Julius von Mohl (q.v.).

MOHL, Julius von, German Orientalist: b. Stuttgart, Oct. 25, 1800; d. Paris, France, Jan. 3, 1876. He was the brother of Hugo von Mohl (q.v.). In 1823, after studying theology for five years at Tübingen, he went to Paris to devote himself to Oriental languages and history. Although holding the assistant professorship of Oriental literature at Tübingen from 1826 to 1833, he spent most of that period in research in London and Oxford. The French government commissioned him in 1826 to prepare a translation of *Shah Namah* (Book of Kings), the great epic of Firdausi (Firdusi), the Persian poet, and this task was his major preoccupation until his death. Six folio volumes of the work were published in Paris between 1838 and 1866, the seventh being completed by Barbier de Meynard. In 1847 he was appointed professor of Persian at the Collège de France; and he became secretary and subsequently president of the Société Asiatique. He published *Lettres de M. Botta sur les découvertes à Khorsabad* (1845), concerning the search for Assyrian antiquities near Khorsabad by Paul Émile Botta; and in collaboration with Justus Olshausen he wrote *Fragments relatifs à la religion de Zoroaster* (1829). His valuable reports to the Société Asiatique between 1840 and 1867 were collectively published after his death by his widow, Mary (daughter of Charles Clarke), under the title *Vingt-sept ans d'histoire des études orientales* (1879-1880). Consult, Simpson, M. C. M., *Letters and Recollections of Julius and Mary Mohl* (London 1887).

MOHLER, mü'lër, **Johann Adam**, German Roman Catholic theologian: b. Igersheim, Württemberg, May 6, 1796; d. Munich, April 12, 1838. He studied theology at the University of Tübingen, and after entering the priesthood taught there, becoming tutor in 1822 and full professor in 1828. He was an able doctrinal exponent, distinguished alike intellectually and spiritually, doing much to arouse the Roman Catholic Church in Germany to new vigor. His writings at this period included *Die Einheit in der Kirche* (1825), *Athanasius der Grosse* (1827), and *Symbolik* (1832). The last, of which an English translation was published by J. B. Robertson in 1843, was an exposition of the doctrinal differences between Protestants and Catholics. It attracted considerable attention, and provoked works in rebuttal by Ferdinand Christian Baur (also a professor at Tübingen), Philipp Marheineke, Karl Immanuel Nitzsch, and others. In reply to their writings, he published *Neue Untersuchungen der Lehrgesetze zwischen den Katholiken und Protestanten* (1834). In 1835 he was given a professorial post at the University of Munich. Consult Friedrich, J., *J. A. Möhler* (Munich 1894).

MOHN, mōn, **Henrik**, Norwegian meteorologist: b. Bergen, Norway, May 15, 1835; d. Oslo, Sept. 12, 1916. After studying at the university in Christiania (now Oslo), he became observer at its astronomical observatory, and in 1866 professor. He was appointed director (1866–1913) of the Meteorological Institute he helped to found there. In 1876–1878 Mohn led a scientific expedition in northern Norwegian waters, and set up the Bossekop meteorological station in Lapland in 1882–1883, as well as other stations in northern Europe. His most important work was *Grundzüge der Meteorologie* (1875; 5th ed. 1898), and he published other books on the climate and meteorology of the North Atlantic, and on the dynamics of the atmosphere, as well as editing, from 1867, the *Yearbook of the Norwegian Meteorological Institute*.

MOHOCKS, mō'hōks, **The**, a club in London, England, also known as the Mohawk Club, although it did not deserve the name of club, being rather a group of young men of fashion who used the club as an excuse for disorderliness in the early 18th century. Their behavior has been frequently mentioned in literature of and about the period. John Gay (1685–1732) mentions in *Trivia* that the Mohawks rolled women in hogsheads down Snowhill, and Jonathan Swift told Stella of a report that 80 of them had been put in prison, while Lady Wentworth, writing to her son, Lord Strafford, says, "I am very much frightened with the fyer, but much more with a gang of devils that call themselves Mohocks." A royal proclamation was issued against them March 18, 1712.

MOHOLY-NAGY, mō'hōl-y nōd'y', **László** (or **Ladislau**), Hungarian painter and designer: b. Borsod, Hungary, July 20, 1895; d. Chicago, Ill., Nov. 24, 1946. First identified with constructivism in Budapest, Moholy-Nagy later designed stage sets, painted, and made use of many materials and forms of art. Forced by the Nazis in 1935 to leave Germany, where in 1923–1928 he had been professor of constructive, texture, and photographic technique at the Bauhaus school in Weimar, he went to London, where he designed the sets for H. G. Wells' motion picture, *The Shape of Things to Come*. In 1937 he founded the Bauhaus School of Design in Chicago, which failed, but as head of the Chicago Institute of Design in 1939 he won backing from important industrial firms for his theories of art in the machine age. He was the author of *The New Vision* (Eng. tr. 1932) and *Vision in Motion* (1947).

MOHON, mō-ōn', commune, France, in the Department of Ardennes, an industrial suburb of Mézières from which it is separated by the Meuse River. It has tool and hardware manufactures and railway shops of the Compagnie de l'Est. A 16th century church was destroyed in World War I. Pop. (1946) 6,541.

MOHR, mōr, **Charles Theodore**, German-American botanist: b. Esslingen, Germany, Dec. 28, 1824; d. Asheville, N. C., July 17, 1901. Educated in the sciences at the Polytechnic High School in Stuttgart, Germany, he afterwards devoted his life to the study of botany. His first expedition was to Dutch Guiana in 1845, where he aided August Kappler's collecting. In 1848 he

went to the United States, taking part in the 1849 gold rush to California, but returning to Louisville, Ky., and eventually to Mobile, Ala. There he specialized in the botany of Alabama, publishing papers for the United States Department of Agriculture on the timber pines of the southern United States and the plant life of Alabama. He prepared exhibits for expositions at Atlanta (1881) and at New Orleans (1884). In 1900 he moved to Asheville to work in the Biltmore Herbarium and to finish his final book *The Plant Life of Alabama*.

MOHR, **Joseph**, Austrian Catholic priest and poet: b. Salzburg, Dec. 11, 1792; d. Wagrein, Dec. 4, 1848. As curé of the newly established parish of Obendorf he wrote a poem entitled *Stille Nacht, heilige Nacht* (*Silent Night, Holy Night*) which, on Dec. 24, 1818, he asked the village schoolmaster and organist, Franz Xaver Gruber (1787–1863), as the latter recalled, "to set to suitable music, for two solo voices, chorus and guitar accompaniment." The organist composed the simple melody in a few hours, and brought it to Father Mohr. The same evening it was sung with great success at the Christmas Eve service, the priest and organist singing the solo parts. A guitar accompaniment had been stipulated because the church organ had broken down. In a few years this nostalgically tender Christmas carol had attained so wide a popularity that it was translated into most modern tongues and became perhaps the best known of all Christmas carols.

Consult Weinmann, Karl, *Stille Nacht, Heilige Nacht* (Ratisbon 1918, 1920).

MOHR, mōr, a North African gazelle (*Gazella mhör*) noted as a source of bezoars, concretions found in the alimentary organs of certain ruminants and valued for their supposed medicinal properties, especially as antidotes for poisons.

MOHS, mōs, **Friedrich**, German mineralogist: b. Gernrode, Anhalt, Germany, Jan. 29, 1773; d. Agordo, near Belluno (now in Italy), Sept. 29, 1839. Successively professor at Graz (1811), Freiberg (1816), and Vienna (from 1826), and the author of several books on mineralogy, he is best remembered for the Mohs' scale, named for him, which he proposed in 1822 to classify the hardness of minerals. See **HARDNESS**, **SCALE OF**.

MOHUN, mōōn, **Charles**, 4th **BARON MOHUN**, English duelist: b. ?1675; d. London, England, Nov. 15, 1712. The diaries and records of the period in which Mohun flourished show him as a high-spirited and uncontrollable young man, playing tricks with Edward Rich, earl of Warwick, arrested at the age of 17 for murder, but acquitted before a jury of his peers, and dueling at every opportunity. He occasionally took his seat in the House of Lords, and was a Whig, supporting William III. His final duel with James Douglas, 4th duke of Hamilton, in which both men were killed, arose from a quarrel over estates, but was interpreted by the Tory Party to have been a Whig plot against Hamilton. An account of the duel occurs in W. M. Thackeray's *Henry Esmond*.

MOHUN, **Michael**, English actor: b. about 1620–1625; d. London, England, October 1684. Before the Civil Wars he acted at the Cockpit in

Drury Lane. Fighting for King Charles I he attained a captaincy, in Flanders was promoted major. At the Restoration he returned to England to resume his stage career. Pepys seeing him for the first time in the *Beggar's Bush* (Beaumont and Fletcher) reported the consensus that he was "the best actor in the world." He was the original Beaumont in Dryden's *Amboyna*, and Ventidinus in *All for Love, or the World well Lost*; also the original Pinchwife in Wycherley's *Country Wife*.

MOI. See ASIATIC TRIBES—*Assam, Southeast Asia, and South China.*

MOIDORE, moi'dōr (Port. *moeda d'ouro*, coin of gold), a gold coin of 4.93 grains of fine gold worth about \$3.27 when in use as formerly in Portugal and Brazil (1640–1732). A double moidore was also minted.

MOIRA, MOIRAI, or MOERAE, moi'rá, in Greek mythology, the Fates, corresponding to the Roman Parcae. Homer speaks of a single divinity who assigns to every man his lot (*moira*); Homer's Moira is the personification of Fate, directing the consequences of man's actions at the behest of the gods; only once does he speak of Fates (Moirai). Hesiod develops the personification of several Fates, identifying the Moirai as three daughters of Zeus and Themis: Clotho, the spinner; Lachesis, the disposer of lots; and Atropos, the inevitable. The first spins the thread of life, the second assigns to man his fate, and the third severs the thread. Like the Parcae, the Latin *Tria Fata* were assimilated to the Greek Moirai. See also FATES.

MOIRE, mwär, a French name for watered silks. Though made in the same way as ordinary silks, these are of double width and must be of a stout substantial make. They should also be folded in such a way that the air contained between the folds should not be able to escape easily. They are subjected to an enormous pressure, of from 60 to 100 tons, generally in a hydraulic machine, and the air, in trying to escape, drives before it the small quantity of moisture that is used, and so produces the permanent marking called watering, which is for the most part in curious waved lines. The finest kinds of watered silks are known as *moires antiques*. Woolen fabrics to which the same process has been applied are called *moreen*.

MOISE, moi'sē, Penina, American poet: b. Charleston, S. C., April 23, 1797; d. there, Sept. 13, 1880. A personality of much charm, she was born of French parents of Hebrew extraction, who came originally from the island of St. Eustatius. She contributed to many of the magazines and newspapers of her day, and a collection of her poems was published as *Fancy's Sketch Book* (1833). Her best known work is contained in *Hymns Written for the Use of Hebrew Congregations* (1856). Despite blindness in later years, she continued to write poems, and her home was a place of pilgrimage to her admirers.

MOISSAN, mwà-sàn', Henri, French chemist: b. Paris, France, Sept. 28, 1852; d. there, Feb. 20, 1907. Educated at the Museum d' Histoire Naturelle and at the School of Pharmacy in Paris, he taught in the latter from 1879 to 1883,

in 1886–1899 became its professor of toxicology and inorganic chemistry, and in 1900 was professor of general chemistry at the Sorbonne. He isolated and liquefied fluorine, winning in 1887 the Lacaze Prize from the Academy of Sciences. He won great fame by his important experiments and achievements with the electric arc furnace. In 1892 he made the manufacture of acetylene simple and commercially profitable by his discovery that if carbon and lime be fused in the electric arc furnace, pure calcium will be formed, which makes the liberation of acetylene an easy matter. Much more spectacular was his formation of artificial diamonds in 1893. In 1906 he received the Nobel Prize in chemistry. He wrote *Reproduction du diamant* (1893); *Étude complète des carbonés amorphes et des graphites* (1898); and *Traité de chimie minérale*, in 5 vols. (1904–1906). See also DIAMOND—*Artificial Synthesis*

MOJAVE DESERT (also MOHAVE), mò hä'vê, arid basin, California, mainly in San Bernardino County. Part of the Great Basin, it lies south of Death Valley and the southern end of the Sierra Nevada and is bordered on the west and southwest principally by the Tehachapi, San Gabriel, and San Bernardino Mountains, meeting the Colorado Desert on the southeast. The Mojave River, an intermittent stream, rises in the San Bernardino Mountains near Lake Arrowhead and flows generally northeastward, disappearing into the sand at Soda Lake, about 90 miles distant. The desert is about 15,000 square miles in extent. Elevations vary from 2,000 to 5,000 feet. Deposits of minerals, including gold, silver, tungsten, iron, manganese, clay, perlite, talc, salines, and boron minerals, lend the Mojave considerable economic importance.

The area is one of low humidity and very scanty annual rainfall, no part ordinarily receiving more than five inches annually. Temperatures are moderately high in winter, very high in summer, with a wide daily range. Before noon the winds begin to blow down the mountain sides, frequently attaining gale proportions on the desert floor. The velocity increases until about midnight, when it lessens, and calm prevails before dawn. On the higher edges of the area are found weird forests of California, or desert, juniper (*Juniperus californica*) and Joshua trees (*Yucca brevifolia*). The latter often reach heights of 30 feet, and present fantastic sentinel-like silhouettes against the sky.

— JOHN H. JONTE.

MOJAVE INDIANS (also MOHAVE), an American Indian tribe, formerly the most populous and warlike of the Yuman linguistic stock. They live on the Colorado River Reservation, the Fort Mojave School Reservation, and near the town of Needles and the entrance to Black Canyon. The Mojaves were pottery makers and farmers who grew corn, melons, and beans in the bottom lands, relying on periodic inundations for moisture. Their houses were of brush, low, and scattered. In 1775–1776 they were estimated at 3,000 persons; in 1905 as 1,589. See also YUMAN STOCK.

MOJI, mò-jê, city, Japan, on the northernmost tip of Kyushu Island, in Fukuoka Prefecture. Moji is a seaport on Shimonoseki Strait, opposite the city of Shimonoseki on Honshu Island, with which it is connected by ferry and a

tunnel built in 1942. Coal is the main export. The city is the terminus of the Kyushu railroad system, and an industrial center with steel mills, sugar refineries, breweries, and rice mills. Its growth from a small fishing village in feudal times began with the completion of the railroad (1887) and was stimulated by the opening of the Kyushu coalfields and war booms during contacts with China and Russia. It was heavily bombed in 1945. Pop. (1950) 124,399.

MOKANNA, mōō-kān'nā, al- (real name HASHIM IBN-HAKIM), Arab religious impostor, fl. 8th century; d. ?780. Called the Veiled Prophet because he hid his face under a veil, supposedly to hide the splendor of his countenance, he won many followers by attributing to himself divine powers and performing apparent miracles. At last the Caliph Mahdi was compelled to send an armed force against him. He retired to a fortress in Transoxiana, where he first poisoned his soldiers and then burned himself. His followers continued to pay him divine honors after his death. He is the hero of Thomas Moore's *Mokanna, or the Veiled Prophet of Khorassan* in the first part of *Lalla Rookh* (1817).

MOKI, mō'kē, or **HOPI**, hō'pē, is a sedentary Indian group of about 2,000 individuals, living on three mesas in the desert of northeast Arizona. Culturally they are related to the Anasazi, or Cliff Dweller—Pueblo peoples, who have inhabited the Southwest for more than 1,000 years. However, they are a Shoshone-speaking people, related to the nomadic Utes of the north, who centuries ago drifted into the Southwest and either borrowed or helped in the development of Pueblo culture. Villages consist of terraced houses rising from a central court. This type of dwelling fortress doubtless developed in connection with defense needs in the past but is still perpetuated by custom. The Hopi are farmers who have searched out every spot in the desert where moisture lingers long enough to grow crops. In these plots they raise corn, beans and squash sufficient for their needs. Their religious life is highly complex and accompanied by elaborate ceremonialism—the chief aim of which is to bring the necessary rain and sunshine (see SNAKE DANCE). Such ceremonies are conducted by semi-secret fraternities which meet in underground chambers (kivas), in or near the central courtyard. Although each pueblo is independent there is a feeling of unity among them. An exception is the village of Hano whose inhabitants came from the Rio Grande Valley in 1680. They speak a different (Tanoan) language and are not fully integrated into Hopi life. Clan organization, with inheritance and descent in the female line, determines one's place in the community and to a large extent regulates behavior. **FAY-COOPER COLE.**

MOKSHA, mōk'shā, river, European Russian SFSR, rising in the Penza Oblast and flowing north and west through the Mordvinian Autonomous SSR, an agricultural region, with dense forests on its west bank. It joins the Oka River above Murom, its course being about 430 miles long. Its lower course is navigable from 30 to 175 miles, according to the season.

MOL, mōl (formerly MOLL), commune, Belgium, in Antwerp Province, 12 miles southeast of Turnhout, on railroads and highways and a

branch of the Nèthe River. It is a popular resort for artists, has a textile industry, manufactures of zinc and tobacco, and cattle markets. Pop. (1952) 20,707.

MOLA, mō'lā, **Emilio**, Spanish soldier: b. Placetas, Santa Clara, Cuba, 1887; d. near Castin de Peones, Spain, June 3, 1937. Appointed to the Infantry Academy at Toledo in 1904, after his graduation he distinguished himself in North African campaigns, earning quick promotions and the Military Medal. A general in 1927, he was given command of the Larache military district in Morocco. However, with the advent of the republic in April 1931 he fell out of favor and was placed in the reserve. The amnesty of 1934 brought him back into active service. Commanding the 12th Infantry Brigade at Pamplona, he was among the officers who threw in their lot with Gen. Francisco Franco and the Nationalist cause in July 1936. Commanding the Army of the North he directed operations against Irun, San Sebastian, and Bilbao in 1937. A hard-fighting soldier and brilliant strategist, he did not live to see the fall of Bilbao or Madrid, both of which cities his forces were besieging, dying in an airplane accident in a flight between the Bilbao front and Burgos. His *Memorias de mi paso por la Dirección General de Seguridad* (1934) was a three-volume defense of his career. Other works include *Lo que yo supe*; *Tempestad, calma, intriga y crisis*; *El pasado*, and *Azaña y el porvenir*. His *Obras completas* were published in 1940. In 1948 the dukedom of Mola was created, making his descendants grandees of Spain.

MOLA, mō'lā, **Pierfrancesco** (sometimes called MOLA DI ROMA), Italian painter: b. Coldre, near Como, Italy, 1612 or 1620; d. Rome, 1666 or 1668. At an early age he went to Rome, where he studied painting under Giuseppe Cesari, Cavaliere d'Arpino. Afterward he painted at Venice, Milan, and Bologna, where he adopted the style of the local painters, especially Francesco Albani. The landscape backgrounds of his religious paintings are his best work. The National Gallery in London possesses his *St. John Preaching in the Wilderness* and *The Repose of the Holy Family in the Flight into Egypt*. In the Ravenna chapel of the Church of Jesus in Rome is his *Peter in Prison*. He also painted the *History of Joseph* in the Quirinal Palace. Other works are in museums in France and Germany. Like Francesco Albani, he was a follower of Annibale Caracci, whose manner he reproduced with ease, but he was lacking in imaginative depth.

MOLA DI BARI, mō'lā dē bā'rē, town, Italy, in the province and district of Bari, a port on the Adriatic Sea and on the Bari-Brindisi Railway. It has a church of the Norman period, a gymnasium, oil presses and tanneries. Pop. (1951) 22,884.

MOLASSES. See SUGAR GROWING.

MOLASSES ACT. See ACTS OF TRADE.

MOLAY, mō-lā', **Jacques de**, last grand master of the Knights Templar: b. Molay, Jura Province, France, about 1243; d. Paris, March 11, 1314. He entered the Order of the Templars in 1265 and became its grand master in 1298. In 1306, after the Templars had been driven from

Palestine, and while he was in Cyprus busied about raising new troops against the Saracens, he was summoned to France by Pope Clement V, who was determined to end the feuds between the Templars and the Knights of St. John. King Philip IV of France fearing, it is alleged, the power of the order, seized de Molay and all the knights then resident in France, after receiving them with the greatest kindness, charged the order with heresy, tried them before a packed court and found them guilty. Molay was imprisoned and ill-used for more than five years, then, after recanting certain admissions of guilt he had made, was burned at the stake as a relapsed heretic. The guilt of the Templars is still a disputed historical question.

Consult Viollet, P. M., *Les Interrogatoires de Jacques de Molay* (Paris 1910).

MOLDAU. See VLTAVA.

MOLDAVIA, mōl-dā'vī-ā, province, Rumania, in eastern Rumania, separated from the Moldavian Soviet Socialist Republic by the Prut River on the east, and from Transylvania in the west by the Carpathian Mountains. The Ukraine is on its northern border, Walachia on the south. It has extensive forests and raises grain, fruit, and livestock. Founded in the 14th century as a principality, it suffered in wars between rulers and countries, under Turkey, Russia, and Austria. The union of Moldavia and Walachia (1861) began the nation of Rumania. Pop. (1948) 2,598,258.

MOLDAVIAN SOVIET SOCIALIST REPUBLIC, a constituent republic, European USSR, in the southwest, in the center of the former province of Bessarabia. On its west is the Prut River and Moldavia; the Ukraine surrounds its other borders. A very fertile region, though very rainy, with poor roads, its industries are mainly agricultural. Several railways cross it. In 1918 after World War I Rumania annexed all of Bessarabia. In 1924 the USSR established the Moldavian Autonomous SSR of the Ukraine, which in 1940 was merged with Bessarabia to form the Moldavian SSR, and the mainly Ukrainian districts were taken back into the Ukraine. Rumania recaptured it with the help of Germany in 1941, but it was retaken by Russia in 1944. Its capital is Kishinev. Pop. (1954 est.) 2,700,000. See also BESSARABIA.

MOLDENKE, mōl-dēn'kē, **Charles Edward**, American Egyptologist: b. Lyck, East Prussia, Oct. 10, 1860; d. Watchung, N. J., July 18, 1935. Moldenke was taken to the United States when a year old by his father, a Lutheran clergyman. He was educated at Columbia University and at the Lutheran Seminary in Philadelphia, after which he traveled and studied abroad, earning a Ph.D. from Strassbourg University in 1885. Until 1900 he was a practicing minister, after which he devoted his time to the study of botany and archaeology. He published *The Egyptian Origin of Our Alphabet* (1886); *The Trees of Ancient Egypt* (1886); *Egyptian Classics* (1900).

MOLE, mō-lā', **Comte Louis Mathieu**, French statesman: b. Paris, France, Jan. 24, 1781; d. Château Champlâtreux, Seine-et-Oise, Nov. 23, 1855. His early years were spent abroad, but after his return to France he became an adherent

of Napoleon Bonaparte, who gave him several important offices. In November 1813 Molé was made minister of justice, and held the same office during the Hundred Days. After the Restoration Louis XVIII appointed him minister of marine (1817-1818). In 1830 he became minister of foreign affairs and in 1836 premier, resigning in 1839, but continued to sit in the Constituent Assembly (1848) and the Legislative Assembly (1849), where he opposed the coup d'état of 1851 which brought Louis Napoleon (Napoleon III) to French dictatorship and retired to private life.

MOLE, mō-lā', **Mathieu**, French jurist and politician: b. Paris, France, 1584; d. there, Jan. 1656. Entering politics at an early age, he became procureur général in 1614. Molé's insistence on law and justice in the case of political prisoners brought him into conflict with his superiors. From 1641 to 1653 he was president of the Parlement, having been appointed by Cardinal Richelieu. During the first Fronde (1648-1649), although often threatened with violence, he attempted to mediate between monarchy and Parlement, succeeding in negotiating the temporary peace of Rueil (1649). In 1651 he became keeper of the great seal, retiring from active politics. His *Mémoires*, in 4 volumes, were published in 1855.

MOLE, mōl, a small, fossorial (digging) velvety-furred mammal of the family Talpidae. The several species are distributed throughout the temperate zones of the Northern Hemisphere in North America, Europe, and Asia. Moles are the size of common rats, but their tails are usually very short; sometimes more or less equal to the length of the head and body. The body is thick and cylindrical; head, in the more highly specialized fossorial species, placed well between the shoulders; neck short; pectoral muscles bulky; snout elongated and either pointed, trumpet-shaped, or "star-nosed"; eyes small, in some species hidden beneath the skin; external ears small, generally without pinna, and nearly always completely hidden by the fur. The limbs are short with five digits each, and in most species adapted for digging. The forefeet are especially large, powerfully built, and spadelike in form and function. The coat is thick, soft, usually velvety texture, and often has a silky sheen. Females are provided with three or four pairs of mammae. There are 9 to 11 teeth on each side of the upper jaw, 8 to 11 in the lower jaw.

Most moles are strictly fossorial; some may be semiaquatic as well. The so-called shrew mole of the Old World, though classified with typical moles in the family Talpidae, do little or no digging. The almyzclero and desman are other non-fossorial members of the family.

The typical fossorial species and type of the family is the common European mole (*Talpa europaea*). This species occurs in all European countries south of 59° north latitude, except Ireland and Portugal. It is very like the North American eastern mole in size, appearance, and habits. Other species of moles of the genus *Talpa* are found in Europe, and in northern, eastern, and extreme southwestern Asia.

The common eastern mole (*Scalopus aquaticus*) of the eastern United States is from five to a half to six and a half inches in head and body length. The tail is from one to one and

half inches long. This mole spends practically its whole life underground. It tunnels just beneath the surface by pushing its way through loose dirt in search of food, which consists of earthworms, insects, and grubs. Its subterranean runways appear on the surface as ridges of broken ground. For nesting purposes, the eastern mole makes burrows from 6 to 25 inches below the surface. Despite its Latin name, the eastern mole is not aquatic.

The star-nosed mole (*Condylura cristata*) of the eastern United States is fond of water and swims as proficiently as it burrows. It is somewhat smaller than the eastern mole, but has a longer tail proportionately. Its eyes are functional and exposed to the surface. The principal distinction of the star-nosed mole is the presence of a starlike ring of 22 fleshy tentacles around the tip of its nose.

The hairy-tale mole (*Parascalops breweri*), the smallest of the eastern American moles, measures about four and a half inches in head and body length. The distinctly haired tail is little more than an inch long. Its nose, as in the eastern mole, is naked and without tentacles. It further resembles the eastern mole by its de-

Star-nosed mole.

generate eyes, which are covered with a membrane, and its fused eyelids.

The four moles that occur along the west coast of the United States include the smallest and largest American species. The Townsend mole (*Scapanus townsendi*) of Washington and Oregon, is the largest, with its head and body six to seven inches long, tail about two inches and slightly hairy. The California mole (*Scapanus uimannus*), an inch shorter, but otherwise similar, ranges along the coast from southern Oregon to northern Lower California. The Pacific mole (*Scapanus orarius*) of Washington, Oregon, and northern California is slightly smaller than the preceding, but otherwise hardly distinguishable. The fourth Pacific coast species, the American shrew mole (*Neurotrichus gibbsii*), is the smallest, measuring less than four inches in head and body length. Its small eyes are visible at the surface, and functional. Its tail is hairy. This species is found on the humid northwest coast from the northern half of California into southern British Columbia.

Closely related to and closely resembling the moles of the western United States are the Japanese hairy-tale mole (*Urotrichus talpoides* and *pilrostris*), the Kansu mole (*Scapanulus oweni*)

American shrew mole.

of China, and the long-tailed mole (*Scaptonyx fusicaudus*) of China and Burma.

PHILIP HERSHKOVITZ,
Curator, Division of Mammals, Chicago Natural History Museum.

MOLE, a long pier or breakwater built of masonry and extending into the sea, at times to a distance of a mile or more.

MOLE CRICKET, any insect of the family Gryllotalpidae, order Orthoptera. Mole crickets differ from other members of the Orthoptera in having the front legs modified for digging in the soil. Their tunnels are inconspicuous, unlike the tunnels of moles. The day is spent underground. While mole crickets appear to be sluggish creatures, they are able to fly with considerable speed. The front wings are short, the hind wings protrude behind them like a pair of tails. The tarsi usually have three segments, as in the true crickets, the ovipositor is inconspicuous, and the unsegmented cerci are short.

The commonest European species, *Gryllotalpa gryllotalpa*, which is about two inches long, has become established in the United States. The most widespread American species is *G. hexadactyla*, which occurs over most of the United States and Central and South America. The eggs are laid in the burrows, some of which may extend a foot or more below the surface of the ground. The young resemble the adults except for the absence of wings. When numerous, mole crickets may cause damage to cultivated crops. Poisoned baits are used to control them. Members of the South American and Australian genus, *Cylindrachueta*, are quite slender, and burrow into the stems of plants.

CHARLES HOWARD CURRAN,
Curator, Department of Insects and Spiders, The American Museum of Natural History.

MOLECH. See MOLOCH.

MOLECULAR THEORY, in physics and chemistry, asserts that the properties of ordinary pieces of matter are the properties of an aggregate of very small particles, called molecules. The distinction between molecular theory and atomic theory is that whereas a molecule is generally defined as the smallest particle of a chemical substance that is capable of independent existence, an atom is defined as the smallest amount of any chemical element that can take part in chemical combination. (See ELEMENT.) Until the 19th century it was not possible to distinguish between atoms and molecules, and even today the names are sometimes used interchangeably. The early Greek philosophers of the atomistic school used the term atom in much the same way that we now use the word molecule.

The distinction between atoms and molecules may be illustrated by considering the substance water. If we imagine ourselves taking a progressively smaller and smaller amount of this substance there comes a time when we can no longer subdivide the material without destroying its character as being water. At this stage we are dealing with one molecule. But this molecule may be broken into fragments by an electrical discharge or by other means, and it yields three atoms, two of hydrogen and one of oxygen. For that reason the molecule of water is said to be triatomic, and is written H₂O. A molecule such

as sodium chloride (common salt) is diatomic, and is written NaCl (Na for sodium, after the Latin *natrium*, Cl for chlorine). Ethyl alcohol (the normal alcohol in spirits) is $\text{C}_2\text{H}_5\text{O}$, and is said to be polyatomic, though for reasons to appear later it is more usual to write it $\text{C}_2\text{H}_5\text{OH}$. Thus molecules vary in size from the monatomic elements helium, neon, argon—which contain only one atom and are therefore both atoms and molecules according to our definition—through diatomic and triatomic molecules to huge assemblies such as a protein molecule (see **PROTEINS**) containing many thousands of atoms. There are even grounds for believing that each of the 10 to 20,000 genes (see **GENETICS**) which control the hereditary characteristics that we inherit from our two parents, is essentially one large molecule.

The distinction between atoms and molecules may be seen in a slightly different way if we compare two solids, solid hydrogen and solid copper. Hydrogen, which is a gas under normal conditions, becomes a solid at very low temperatures. Solid hydrogen consists of diatomic molecules (written H_2) arranged in a regular fashion. The individual molecules may be free to turn round about, and even to vibrate to and fro in a limited fashion; but they remain individual molecules, and on allowing the temperature to rise, the solid evaporates to become a gas of H_2 molecules. In solid copper, however, there is again a regular arrangement of atoms which can vibrate to and fro around their mean centers of position. But the unit is the separate atom, and there is no tendency to form clusters of atoms of any definite size. Solid hydrogen may therefore be called a molecular crystal, solid copper is an atomic crystal.

STATES OF AGGREGATION

Gases.—Molecules may exist in three states of aggregation—gaseous, liquid, and solid. In the gaseous state the molecules are well separated from each other, and fly about in all directions with a wide range of velocities, occasionally colliding with each other, or with the walls of the container, and then bouncing off. Except during the relatively short time of collision the molecules may be regarded as distinct and isolated. Their behavior is described by the kinetic theory of gases (see **GASES, KINETIC THEORY OF**) which accounts in a satisfactory way for the pressure which they appear to exert on the container as a result of their incessant collisions with it, and for the heat energy which they possess as a result both of their random velocities and also of their internal motion. A molecule of water, for example, which we write as H_2O , is not entirely rigid; but the three atoms can make small vibrations, or oscillations, relative to each other. These internal vibrations and rotations occur with very great frequency, but the distances moved by the atoms away from their mean positions are very small, so that these internal motions do not at any stage destroy the triatomic character of the molecule.

Liquids.—In the liquid state the molecules are much closer together, but they do not have fixed, or even nearly fixed, centers of position, and can drift—or, more strictly, diffuse—from one part of the liquid to another. The rate of this diffusion depends on the temperature, since at higher temperatures it is supposed that the molecules have more energy of motion than at lower temperatures, and are therefore better able to

overcome any restraining forces that tend to confine them to any one region. The rate of diffusion is measured by the diffusion coefficient, and the variation of this coefficient with the temperature allows us to estimate the magnitude of the forces tending to confine the molecule. Thus according to this picture any one molecule in a liquid is always surrounded by other molecules, almost filling the available space, and in continual oscillatory motion; from time to time a small gap appears momentarily in the surrounding sheath of molecules (molecule *C* in Fig. 1), and if the central molecule has sufficient energy, it may break through this gap and thus move one unit of distance away from its starting point. The energy *E* necessary to break through in this fashion is called the activation energy for molecular diffusion, and the diffusion coefficient varies with the temperature according to an exponential law $e^{-E/kT}$. (*T* is the absolute temperature and *k* is Boltzmann's constant 1.371×10^{-16} per degree.)

The process of evaporation of a liquid is a particular case of this phenomenon, for it corresponds to a molecule of the liquid breaking completely away from its neighbors and becoming a gas molecule. The fact that in order to evaporate any large quantity of liquid it is necessary to heat it, and thereby to give the mole-

Fig. 1. The boundary of a molecular liquid. Notice the fairly close type of packing of the molecules. A molecule *A* experiences forces in all directions and these effectively cancel each other out. A molecule *B* is attracted towards the interior of the liquid, and can evaporate from the liquid only if sufficient energy is given to it. A molecule *C* finds itself with a momentary gap in the sheath of surrounding molecules, and, if it has sufficient energy, can diffuse to a neighboring position, as shown by the arrow.

cules more energy, shows us that in the liquid state molecules attract each other. These attractive forces have to be overcome when a molecule evaporates. It also follows that a molecule (*A* in Fig. 1) in the body of a liquid is being attracted by its neighbors on all sides, and therefore experiences no mean force in any particular direction. But a molecule at the edge of a liquid (*B* in Fig. 1) is attracted towards the body of the liquid by those adjacent molecules which lie inside the liquid, and there are no corresponding forces to balance this, since there are effectively no adjacent molecules outside the boundary. Thus there is an apparent force tending to pull the liquid into as compact a volume as possible. Another way of putting this is to say that the liquid appears to be always trying to reduce its surface area. In this way we see how intermolecular forces give rise to the phenomenon of surface tension. (See **SURFACE TENSION**.) The stronger these forces of attraction the larger is the surface tension.

Molecular Layers.—A particularly interesting and important application of this occurs in the common use of soap. A good foam, or lather, can be obtained if the surface tension is sufficiently low. Water has a rather high surface tension but this value is considerably reduced by the use of soap. The important part of the soap for this purpose is a molecule called sodium stearate.

This is a long molecule similar in shape to a match, and having for the "stick" a relatively long tail composed of carbon atoms and hydrogen atoms. The "head" is a much more chemically active group (actually CO_2Na) which rapidly combines itself in the water, so that a layer of molecules is soon formed (see Fig. 2) with the "heads" all parallel to each other and sticking out of the water. The forces of attraction between these hydrocarbon tails which form the new surface are so much smaller than those between molecules of water that the surface tension is drastically reduced, and a good lather is easily formed. The existence of this layer of sodium stearate molecules, which, if it is only one molecule thick, is called a monomolecular layer, has been verified by an ingenious technique due to W. McBain, whereby the top layer of the liquid can be skimmed off. The change in surface tension when a small amount of soap is dissolved in the water is clearly demonstrated.

Molecular Distribution Function in Liquids.—According to our earlier description of a liquid, the constituent molecules are quite close together, as in Fig. 1, but in a somewhat irregular fashion. This description can be verified experimentally by the use of X-rays. For if we let a beam of rays fall upon a liquid and think of the beam as if it were a stream of bullets (sometimes called photons), then we can see that there will be

Fig. 2. A monomolecular layer of soap (sodium stearate) on the surface of water, which reduces the surface tension and makes foaming and lathering much easier.

collisions of these photons with the molecules of liquid. Consequently many of the photons will emerge from the liquid in directions different from their line of incidence. It was shown by Zernicke and J. Prins in 1927, and more fully by P. Debye and H. Menke in 1932, that from a careful study of the way in which the number of photons scattered through a certain angle depended on the angle, it was possible to calculate the distribution of neighbors around any given molecule. This distribution, which is called the molecular distribution function, is an average taken over all the molecules. Thus, in the case of liquid water at room temperature it appears that on the average each H_2O molecule is surrounded by a first shell of between 4 and 5 neighbors, though none of these ever gets closer than about 2.3 angstrom units of length (1 angstrom = 10^{-8} cms). This, incidentally, tells us something about the size of the water molecule, though there are better ways for measuring these sizes, which will be shown later. Other details of the molecular distribution are found in the same way, such as that outside the first coordination shell there is a tendency to form a second shell at a distance of 4.8 angstroms. However, on account of the diffusion and other motion of the molecules these distances are only mean or average distances. What this analysis shows most clearly is that in a liquid there does not exist the rigid, highly regular type of molecular arrangement

which is typical of a solid. It also shows that as the temperature is increased the various coordination shells become more and more blurred, as a result of the molecules acquiring more heat energy, and oscillating backwards and forwards through larger and larger distances.

Molecular Solids.—The distinction between a liquid and a solid is that although both are compact, without much space being wasted between the component molecules, the arrangement in the solid is regular and, relatively, fixed. A particular example will show what this means. Let us consider the molecules of methane—the chief constituent gas which bubbles up in muddy water containing decaying vegetation, when it is disturbed. Each molecule of methane consists of one carbon atom and four hydrogen atoms, and is written as CH_4 . Its shape (see later) is roughly spherical. If the temperature is sufficiently low methane becomes liquid: the molecules remain intact, but fit quite close together in the fluctuating sort of manner illustrated in Fig. 1. Now let the temperature be lowered still further. Eventually the liquid freezes, that is, solidifies, and in this state each molecule takes up a definite position, or center, around which it moves with a vibrational motion of relatively small amplitude. These regularly arranged positions form what is called a face-centered-cubic lattice. This means that if an array of similar cubes are stacked corner to corner, there is a molecule of methane at every corner of each such cube, and another molecule in the center of each face. These molecules are rotating and vibrating but only very occasionally does one leave its lattice site and diffuse to some other lattice site. If the temperature is now lowered still further, there comes a moment when the molecules cease to spin around their centers. But they still vibrate and retain their molecular identity.

There are other forms of crystal packing with molecules of a different shape from that of methane. All of them may be identified by X-ray analysis, using methods analogous to those previously described for liquids. However, the analysis of solids, particularly monatomic solids such as copper, had been developed much earlier than the analysis of liquids, and dates from the discovery by Max von Laue in 1912 of the scattering of X-rays by a crystal. Molecules such as methane, whose chemical valence (see later) is fully satisfied, do not exert very great forces on each other, and consequently they tend to fit into a crystal lattice in such a way that they pack as closely together as possible. Generally this implies a large number of neighbors which may be said to be almost touching each other. (In the case of methane each molecule has 12 close neighbors.) The essential problem in this field of chemical crystallography is two-fold: first, to discover the type of lattice at whose lattice points the molecules are centered; second, to discover the way in which the molecules orientate themselves relative to these lattice points. With nearly spherical molecules such as methane there is very little tendency to orient the molecules except at exceedingly low temperatures. But with less symmetrical shapes the elucidation of the orientation of the molecules is a matter of great complexity. Benzene, for example, is a molecule with the chemical formula C_6H_6 . Its shape is that of a rather thin flat disk. Fig. 3 shows the appearance of crystalline benzene. The molecules arrange themselves in such a way that, when

looked at end-on, they fit together in this unexpected manner. Each molecule has 12 nearest neighbors, four of which, unshaded, lie with their centers in the plane of the paper, and four, shaded, in each of two parallel planes above and below the original plane. By virtue of the two directions in which the planes of the molecules lie, it is found that a closer packing is possible than if all the disks were placed parallel to each other.

Forces Between Molecules.—Two questions immediately arise out of this discussion. First, are molecules in the gaseous, liquid and solid states identical, or does the state of aggregation modify them in any way? Second, what is the nature of the forces that act between molecules, and determine both the temperatures at which the changes occur from one state to another, and the way in which molecular packing occurs?

The answer to the first question is that in most cases the molecule is scarcely affected by a change of state. Two examples will illustrate this. The iodine molecule is diatomic, and written I_2 . Each isolated molecule, when isolated, consists of two atoms held together at a distance of about 2.65 angstroms. But when the molecular crystal is formed, this distance is increased to about 2.70 angstroms. Such a small change shows that each I_2 molecule is almost unchanged in going from the gas phase to the solid phase. Our second

Fig. 3. Solid benzene. Each disc, shown in profile, represents one molecule. Unshaded molecules have their centers in the same plane as the central molecule. Shaded ones have their centers in parallel planes above and below the plane of the paper.

example is benzene, already referred to in connection with crystal packing. It can be shown from infrared spectroscopy that a benzene molecule performs a variety of internal vibrations in which its shape is distorted in a rhythmical fashion. These vibrations can be studied in the gaseous, liquid, and solid states. It is found that the time taken for a typical vibration changes by only one third of one per cent on going from the gas to the crystal. We conclude that in most cases the molecules suffer very little deformation in these phase changes. It is this near-invariable character of a molecule that makes a thoroughgoing molecular theory possible.

For the sake of completeness it must be added that this invariable character of a molecule does break down sometimes. The most interesting examples are referred to as molecular complexes. In such complexes pairs of molecules—usually of different species—are able to exert sufficiently strong forces on one another that, for example, their color is profoundly modified. A familiar illustration is a combination of benzene (C_6H_6) and iodine (I_2) which forms a molecular complex with one molecule of I_2 attached strongly to one molecule of C_6H_6 . In this close association the properties of both molecules are much more modified than in liquid benzene or liquid iodine. But even now it is interesting to notice that if the complex is broken up, as will occur on heating,

the components split off as normal molecules of iodine and benzene.

The second question—concerning the forces between molecules—is more difficult to answer. It is evident that they are of great importance in understanding both the transitions from one state of aggregation to another, and also the type of crystal packing in the solid. Two facts about these so-called intermolecular forces are well established. When two molecules are well separated from each other—by a distance more than 2 to 3 times the size of the molecule—it seems that they will almost always attract each other. The only serious exceptions to this rule arise when the molecules carry net electrical charges, and then, on account of the inevitable forces of repulsion between like charges, the molecules will repel each other. The other well established fact is that if we attempt to bring two molecules close together, there comes a stage when, instead of attracting each other, they exert forces of repulsion. The interpretation of these repulsion forces is that they come into play when the molecules begin to overlap each other. We shall see in later paragraphs that there is no rigorously defined boundary of a molecule, so that

Fig. 4. Van der Waals' surfaces around the hydrogen and chlorine atoms in a molecule HCl . The outer contour, which is symmetrical around the axis passing H and Cl , gives the distance of closest approach of any other molecule.

the moment at which the overlap begins is itself not clearly defined. We may say that the repulsive forces are ineffective until the separation between the molecules is decreased below a certain value, but that then the magnitude of these forces increases very rapidly. As a result the combination of attractive and repulsive forces leads to a net attractive force at large distances of separation, and a net repulsive force at small distances. If the molecules are not very symmetrical (compare benzene whose shape is like a thin disk) then there is a complicated variation of the repulsive force with the mutual orientation of the molecules, as well as with their mutual separation. It appears that a good description of this situation is obtained if we suppose that we draw an imaginary surface round each atom in a molecule; the radii of these spherical surfaces are sometimes called the van der Waals' radii of the atoms, in honor of J. D. van der Waals, the Dutch scientist whose early observations of the pressure of a gas, in his doctoral dissertation at Leiden in 1873, initiated much of the later study of intermolecular forces. Fig. 4 shows the van der Waals' spheres round the diatomic molecule hydrogen chloride (HCl). Experience now shows that in the solid state it is exceedingly rare to

and atoms in adjacent molecules closer together than the sum of their van der Waals' radii. This is because as soon as the van der Waals' surfaces of two molecules begin to overlap, the forces of repulsion grow rapidly, and the system is no longer stable.

An example will show how this notion is applied in practice. Molecular iodine is diatomic, written I_2 . In the solid it crystallizes as shown in Fig. 5, where any one I_2 molecule lies surrounded by six others in the same plane, and eight more in parallel planes above and below it. The diagram shows that the packing is such that all iodine-iodine distances between neighbor molecules are approximately equal, with a value 3.54 angstroms. Thus we may infer that the van der Waals' radius of an iodine atom is $\frac{1}{2} \times 3.54$, i.e. 1.77 angstroms. In passing we may notice that this radius is considerably greater than one-half of the distance between iodine atoms in the same molecule ($\frac{1}{2} \times 2.65 = 1.33$ angstroms). This shows that the forces responsible for holding the atoms together to form the molecule are of a different nature from those which one complete molecule exerts on another complete molecule.

At this stage it may be asked why, if each pair of molecules attract each other at reasonably large distances apart, they do not always come together and form liquid or solid aggregates.

Fig. 5. The crystal of molecular iodine I_2 . The thick molecules lie in the plane of the paper, the dotted ones lie above and below the plane of the first group.

For by doing this they would appear to lower their total energy, that is, become more stable. The explanation of this apparent paradox is that at temperature T° (measured on the absolute scale of temperature) each molecule possesses an energy of motion, called kinetic energy, whose magnitude is $\frac{3}{2} kT$ where k , as before, is Boltzmann's constant. Unless T is fairly small this kinetic energy of motion will be sufficient to overcome the gain in potential energy when the two molecules are kept near each other, and the system behaves as a gas. On cooling the gas, however, the kinetic energy term $\frac{3}{2} kT$ decreases until eventually the potential energy forces dominate, and first a liquid (where the molecules are close together but still can move about) and then a solid (when they can no longer move about so easily) are formed.

Origin of the Attractive Forces.—We have seen that the origin of the repulsive forces between molecules lies in the compressive distortion of each when they are held too close together. The origin of the attractive forces which are so important in the gaseous and liquid phases, is more complex. Following the pioneer work of W. H. Keesom (1912), P. Debye (1920) and F. London (1930) it is now recognized that at three effects all contribute to these attractive forces. The first of these, identified by Keesom, is called the orientation force (some-

Fig. 6. Two molecules A , B , with permanent dipole moments. The interaction of the $+$ and $-$ charges on these molecules gives rise to the orientation force of attractions.

times alignment force); the second, identified by Debye, is called the induction force; the third, whose development had to wait for the growth of wave mechanics, since it has no simple model in classical theories, was identified by London, and is called the dispersion force. These three forces may be briefly described as follows:

Suppose (Fig. 6) that we have two molecules A and B , in which the electric charge possesses an asymmetry, with the result that the mean center of the positive charges does not coincide with the mean center of the negative charges in each molecule. These mean positions are labeled $+$ and $-$ in the figure. The molecules are electrically neutral, because the total amounts of positive and negative charge are equal. But they are said to possess a dipole moment. We may suppose that these dipole moments are of fixed magnitude, but as the molecules spin around their respective centers, the direction of each dipole moment is continually changing. The energy of interaction of the two molecules is the same as the energy of interaction of the pair of $+$ and $-$ charges. Evidently this depends on the directions in which the dipoles are instantaneously pointing. But when proper allowance is taken for all positions, it turns out that there is a mean energy of attraction; and this energy varies inversely as the sixth power of the distance between the molecular centers. This corresponds to a force of attraction varying as the inverse seventh power. This force is called the orientation force because it arises from the mutual orientation of the molecules. With symmetrical (homonuclear) molecules such as H_2 or I_2 , it is evidently zero, since by symmetry the centers of positive and negative charge coincide and there is no dipole moment.

The induction force has a related origin. For if, as in Fig. 7, the molecule A has a fixed dipole moment, but B does not, it will, notwithstanding, acquire one as a result of the electric field due to A . We may say that the asymmetry of charge in A induces an asymmetry in B . Once this happens there will be a net force of attraction just exactly as in the case of two fixed dipole moments. Its variation with distance is also of the same type. In the above account we have explicitly assumed that B had no permanent dipole moment. This, however, is an unnecessary assumption. All that happens in that eventuality is that an additional moment is induced; this adds on to the original permanent moment, leading to an induction force superposed upon an orientation force.

Fig. 7. Two molecules A , B , of which A has a permanent dipole moment. The electric field due to this, shown by the arrow at B , induces in B a new dipole moment, which then interacts with the original one on A to give the induction force.

if we think of each molecule as a system containing one or more electrons, in continual motion. At any moment there will be, in both molecules *A* and *B*, temporary asymmetries of charge. These asymmetries fluctuate with extreme rapidity, but they interact with each other and when averaged over their fluctuations give rise to an attractive force. The reason for the name dispersion forces lies in the fact that the electrons responsible for the fluctuating dipole moments are precisely the same as the electrons which are responsible for the scattering, or dispersion, of light according to the theories of H. A. Lorenz and, later, H. A. Kramers and W. Heisenberg (1925).

The most interesting and important fact concerning the three contributions to the attractive forces is that all of them correspond to a potential energy of interaction which varies as the inverse sixth power of the distance. This implies a force varying as the inverse seventh power. The orientation force is inversely proportional to the temperature, and becomes of less importance as the temperature rises. The other two contributions are independent of temperature. This group of three forces is often known collectively as the van der Waals' force between the two molecules. Generally the induction forces are the smallest of the three, the orientation forces (at room temperature) being greater than the dispersion forces if the dipole moments are large (as in water) and smaller if the dipole moments are not large (as in HCl). With molecules such as H_2 and CH_4 , which possess no permanent dipole moment, only the dispersion forces exist.

The most simple mathematical expression of these forces is due to J. E. Lennard-Jones (1924). He suggested that the potential energy be used, rather than the force; this is the sum of a term b/r^6 due to the attractions, where *b* is a constant and *r* is the intermolecular separation; and a term often taken to be a/r^{12} , to represent the repulsion. Since the attraction gives negative potential energy, the total energy of interaction is the so-called Lennard-Jones potential $a/r^{12} - b/r^6$.

Virial Coefficients.—This account which has just been given of the forces between two molecules is largely a theoretical one. Experimental measurements are almost wholly confined to applications of the kinetic theory of gases. If a gas consists of molecules which are quite rigid and exert absolutely no forces on one another, the pressure *p* and volume *V* are related to the number of molecules *N* and the absolute temperature *T* by Boyle's and Charles' law: $pV = NkT$ (*k* is Boltzmann's constant). However, if the molecules do exert forces on each other this equation of state is no longer valid, and may be replaced by a more general equation:

$$pV = NkT \{1 + B/V + C/V^2 + \dots\}$$

where the coefficients *B*, *C*, are functions of the temperature. They are called the second, third, virial coefficients, the word virial being derived from the Latin *vis* (plural *vires*) meaning force. Careful measurements of pressure, volume, and temperature over a wide range of values enables the virial coefficients *B* and *C* to be determined. According to the kinetic theory of gases these are simply related to the forces between the molecules. By this means it has become possible to infer the law of force, and, if the Lennard-Jones potential is being used to represent it, to

estimate the values of the unknown parameters *a* and *b*.

An alternative line of approach to the study of molecular interactions is by careful measurement of the transport properties—thermal conductivity, viscosity, electrical conductivity. Yet another approach is to shoot a stream of molecules with known speed into a gas of the same molecules. There will be collisions, so that the original molecules are scattered. From a study of the number scattered through any given angle it is, in principle, possible to calculate the law of force. At present these methods have not proved so easy to handle, or so fruitful, as the earlier virial expansion methods.

STRUCTURE OF MOLECULES

We now pass from an account of the forces between molecules and the way they pack together in liquids and solids, to consider the structure of an individual molecule. In early days there was no point in asking the questions: what is the size and what is the shape of a molecule. For there were no ways of effectively answering such questions. The only kind of question which it was possible to ask was: how many atoms of one kind will combine with an atom of another kind? Considerable progress was made in this latter direction. It was found, for example, that atoms of hydrogen always formed a diatomic molecule (H_2), and that one atom of carbon was able to combine with four atoms of hydrogen in the form of methane (CH_4). But why no one could ever isolate H_3 or CH_3 was a question whose answer could not be provided until the advent of wave mechanics in 1926. Until that time the atom itself was thought to be rather like a billiard ball of extremely small size around whose surface there were attractive forces, rather like hooks, with which it could attach itself to other atoms. The number of such hooks measured the number of atoms with which it could simultaneously enter into chemical combination. It was usually called the valence of the atom. Thus hydrogen was monovalent, carbon tetravalent. For light atoms the combining ratio was usually a constant for any pair of atoms (for example C and H, giving CH_4). But for heavier atoms, particularly the so-called transition elements of the periodic table (see PERIODIC LAW) and the rare earth atoms, many different valences were found to exist for the same atom, and the idea of a definite valence for an atom is less satisfactory. As long ago as 1860 (W. Odling) and 1861 (A. Kekulé) it became the custom to represent the bonding together of two atoms in a molecule by a line. Thus H_2 would be written

to represent the mutual satisfying of all the valency demands of each of the atoms in the molecule. This representation provides some sort of basis for understanding our inability to isolate any CH_3 , since not all the valency demands of the carbon atom would be satisfied. (Incidentally, we now have very good grounds for believing that CH_3 —the methyl radical—does exist, for minute periods of time, and plays a central part in many chemical reactions. But it cannot be isolated, and can at best be called an unstable molecule.)

In cases such as those of molecular hydrogen and methane, in which the valency demands were all met by the drawing of a single line between pairs of atoms, it became usual to speak of a saturated molecule, and the bonds were called single bonds. But there were other cases, such as carbon dioxide (a chief constituent of soda water), where, to preserve the valence numbers of the atoms, it was necessary to draw two lines between some of the atoms—for example $\text{O}=\text{C}=\text{O}$. These bonds were called double bonds, and the molecules were said to be unsaturated. In acetylene, whose formula was simply C_2H_2 it was necessary to introduce triple bonds $\text{H}-\text{C}\equiv\text{C}-\text{H}$. To a very large degree, however these diagrams were formal; for they did not say whether the three atoms in CO_2 were in a line, as in fact they are, or whether the two $\text{C}=\text{O}$ directions make an angle with each other. The matter is not at all obvious or clear-cut, for although both $\text{C}=\text{O}$ and $\text{H}-\text{C}\equiv\text{C}-\text{H}$ are linear, neither water ($\text{H}-\text{O}-\text{H}$) nor hydrogen peroxide ($\text{H}-\text{O}-\text{O}-\text{H}$) is linear. Nor do such diagrams give any indication of the size or length of the bonds. Historically their value was, first, that concentrating on the valence number of an atom they interpreted the familiar combining ratios and showed, for example, that methane could only have the structural relationship expressed by

as $\text{H}-\text{H}-\text{C}-\text{H}-\text{H}$, which were not excluded by the chemical formula CH_4 , being excluded by their failure to saturate all the atomic valences. This, incidentally, is the reason why, a little earlier, we said that ethyl alcohol was written H_3COH rather than $\text{C}_2\text{H}_5\text{OH}$. For $\text{C}_2\text{H}_5\text{OH}$ shows that its structural formula must be

with the same overall formula, but different relative structural arrangement of the atoms, are called isomers. Secondly, these structural formulae focused attention on the mutual orientation of the atoms, and led to further work, both theoretical and experimental, which established the stereochemistry of a molecule (that is, spatial relationship of the atoms) and its size and shape (that is, distance apart of the atoms). In the solving of these problems, mathematics, physics and chemistry have now almost merged into one another.

Experimental Molecular Structure.—Questions about the size of a molecule are essentially physical questions, and so physical ideas and experiments are needed to answer them. But questions about the shape of a molecule are both physical and chemical. The strictly chemical type of reasoning is less clear-cut than the physical, but until the 1920's it had progressed much farther.

suggests, as was found experimentally, that all four $\text{C}-\text{H}$ bonds are equivalent, so that there is only one type of molecule CH_4X , where X is some other monovalent atom which has replaced one of the H atoms. But the original CH_4 molecule might be planar; or it might be a prism with the four H atoms as base and the C atom as vertex; or it might be a tetrahedron with the C atom at the center and the H atoms at the vertices (see Fig. 8); and there are other alternatives also. The chemical fact that it has only been found possible to obtain one di-substituted methane of type CH_2X_2 makes it almost certain that the tetrahedral shape is the correct one. Arguments of this kind were used by J. H. van't Hoff and J. A. Le Bel to establish the tetrahedral character of carbon in a large number of saturated systems, and led to the idea of definite valency angles. But quite evidently the number of cases where such arguments are applicable, is limited, and the arguments themselves are not rigorous. Thus the nonexistence of more than one type of molecule CH_4X_2 may mean nothing more than that one of the various alternatives is so much more stable than the others that we always form it and not the others. We should

Fig. 8. Conceivable shapes for the methane molecule CH_4 . (A) is planar, (B) is pyramidal and (C) is tetrahedral. Only (C) is correct.

not therefore be led unequivocally to a tetrahedral carbon atom.

Physical Approach.—The more physical lines of approach to this problem may be classified under the main headings (a) electron diffraction, (b) X-ray diffraction, (c) spectroscopic.

Electron diffraction: In electron diffraction a beam of electrons is fired into a container filled with a gas containing the molecules under investigation. The electrons are scattered in all directions, chiefly by the nuclei of the atoms. These electrons, on emerging from the gas, fall on a photographic plate, or other measuring system. From a careful analysis of the way in which the number of electrons at any angle varies with the angle of scatter, it is possible to infer the relative positions of the atoms of the scattering molecules. This technique has been much used, particularly in America, to study small molecules in the gas phase. In the early 1950's, however, modifications of the method, particularly in the USSR, have allowed crystalline solids to be studied also.

We have already discussed X-ray diffraction methods in our earlier account of solids. In early days this method was widely used for nonmolecular solids. The reason for excluding molecular solids was that in each repeating unit, or unit cell, of the solid there might be a quite large number of atoms, so that immense calculations would be needed to establish the detailed shape of each molecule. But the advent of electronic

computers has changed this situation. Professor R. Peipinsky of Pittsburgh University has developed a machine of this kind (XRAC) which will make the necessary calculations in what is often less than one per cent of the previous time. As a result it is now practicable to deal with molecules of 30 or 40 atoms; and there is every reason to suppose that eventually some of the very large systems like proteins will be understood in their molecular architecture.

There is one important difference between electron diffraction and X-ray diffraction so far as the study of molecules is concerned. A beam of electrons is scattered chiefly by the nuclei of the atoms, a beam of X-rays chiefly by the electrons of which the atoms are composed. So it would be more accurate to say that electron diffraction tells us where the nuclei are, X-ray diffraction tells us the charge-cloud density at all points of the molecule. We shall see later that the electrons in a molecule may be represented by a kind of cloud of negative charge. It is the density of this cloud that may be inferred from X-ray observations. With heavy atoms the density is exceedingly great in the immediate vicinity of the nucleus, so that there is no difference between conclusions from the two types of experiment. But with light atoms, and particularly with hydrogen, which only carries one electron, the electron diffraction technique has advantages over the X-ray technique. In the year 1955 the relative status of the two methods was that except for the location of hydrogen atoms, X-ray analysis (in the solid) was distinctly more accurate than electron diffraction (in the gas). Since World War II a beam of neutrons (see NEUTRONS) has been used instead of X-rays. These particles are greatly scattered by hydrogen atoms, so that a new approach to molecular structure determination has begun, complementary to the other two.

However, there can be little doubt but that, where it can be applied, spectroscopy gives the greatest accuracy. Conventional spectroscopic measurements yield what are effectively principal moments of inertia. Now each molecule has three such moments, though a planar molecule is such that the greatest moment of inertia is exactly equal to the sum of the other two. A linear molecule has one moment of inertia zero and the other two equal. In the case of a diatomic molecule consisting of two masses m and M a distance l apart, the moment of inertia, measured relative to the center of mass as origin, is $mMl^2/(m+M)$. If the value of this quantity is known, then l is soon calculated. With polyatomic molecules the corresponding formulae are more complex, but not fundamentally more difficult to obtain. With three atoms, for example, they involve not only the three atomic masses, but also the two bond lengths and one valence angle. The experimental measurement of one moment of inertia does not therefore immediately yield one bond length or one valence angle, but a relation between them. As there are in general three independent moments of inertia it follows that by careful analysis of the rotation-vibration spectrum three independent relations between the molecular constants can be obtained. By themselves these may not be sufficient to specify all the parameters—such as bond lengths and bond angles—which define the shape and size of the molecule. But the number may not infrequently be increased by supposing that in related mole-

cules (such as CH_4 , $\text{H}_3\text{C}-\text{CH}_3$) certain parameters (such as C—H bond length) remain invariant. The number may also be increased by the device of replacing one or more atoms by isotopes (see ISOTOPES) which are chemically entirely equivalent to the original atoms, but which differ by having a different mass. This new mass affects the moments of inertia, and so alters the spectrum. The most important such isotope replacement is of hydrogen (H) by deuterium (D), that is, heavy hydrogen, for which the mass is twice as large. But carbon may be used, with mass numbers 12 and 13, and other atoms have similar alternatives. A suitable synthesis of all the information obtained from a series of isotopic substitutions in one given molecule may sometimes be sufficient to yield internuclear distances (that is, bond lengths) and valence angles with an accuracy of 1 in 10^4 . Particularly is this the case when the newer microwave techniques can be used. An accuracy of this order is embarrassingly high. For it must always be remembered that the atoms are vibrating around their mean positions: even at low temperatures the amplitudes of these residual, or zero-point, vibrations exceed the precision with which the mean bond length is known. X-ray and electron diffraction measurements seldom give an accuracy anything like so great, and seldom one better than in 10^3 .

In addition to the measurements of moments of inertia which have just been described, there are some more subtle, but exceedingly important, factors which help to fix the shape, or more correctly the symmetry, of a molecule. We know that a molecule of N atoms has $3N - 6$ modes of internal vibration ($3N - 5$ if it is a linear molecule). If the molecule has some symmetry these vibrations will reveal it. For example, linear molecule like CO_2 , in which the C atom lies symmetrically between the two O atoms, have a total of 4 (i.e. $3 \times 3 - 5$) internal modes of vibration. Two of these can be shown to be "parallel" vibrations, in which all three atoms move along their common axis. The other two, of equal frequency, are associated with motion of the atoms "perpendicular" to this axis. In the first place it is possible from the appearance of the infrared and Raman spectra to distinguish parallel and perpendicular vibrations. This is a great aid in identifying the vibrations. And secondly it is possible to show that of the two parallel vibrations, one is symmetrical in the sense that the two O atoms move in phase towards or away from the central C atom, and the other is unsymmetrical with the corresponding motions out of phase. If it can be shown spectroscopically that there are both symmetrical and antisymmetrical modes of parallel vibration in a molecule such as CO_2 , this shows that the two C=O bonds are equal. Analysis of this kind can rule out the structural formula $\text{N}-\text{O}-\text{N}$ for N_2O , and show that it must be $\text{N}=\text{N}-\text{O}$. More complicated symmetries give more information. Thus C. K. Ingold and his colleagues in London have shown by combining all possible spectroscopic measurement, that benzene is planar, and that the six carbon atoms lie at the corners of a regular hexagon, with the six hydrogen atoms directed radially outwards (Fig. 1). Doctors B. Stoicheff and G. Herzberg (1) have shown, by isotopic replacement of H by D, that the carbon-carbon distance is 1.397×10^{-8} cm. The type of mathematics which is used in dis-

using the symmetry properties of a molecule called Group Theory.

A few examples (to be used later) of the kind of information that is obtained in this way may be given at this stage. Thus from its pure rotation spectrum it can be shown that the H—Cl distance in hydrogen chloride gas (Fig. 10a) is 1.27×10^{-8} cm. From the moments of inertia of water we find that the molecule is not linear, but has a valence angle (Fig. 10a) of 45° . From the fact that in methane the largest moment of inertia is not equal to the sum of the other two, we cut out the planar structure (Fig. 8a); and by symmetry considerations we establish the tetrahedral shape of Fig. 8c. Ammonia NH_3 is not planar, but is like a pyramid

Fig. 9 A molecule of benzene. The dots denote carbon atoms arranged in a regular plane hexagonal fashion. The carbon-carbon distance is 1.397 ± 0.004 angstrom units.

Fig. 10b) with each HNH angle equal to about 107° .

There are other ways in which information about certain parts of a molecule may be obtained. Thus in nuclear magnetic resonance we measure the energy necessary to "flip" the spin of one of the nuclei from one of its allowed orientations to another. If, for example, this nucleus is a proton as with the atom of hydrogen, and if there should happen to be a second proton in the same molecule a definite distance away from the first proton, then the energy of flip will be altered. Careful measurements of the absorption of energy in this process allow us to deduce the distance apart of these two atoms, without reference to the rest of the molecule.

Fig. 10. (A) a water molecule H_2O , (B) an ammonia molecule NH_3 .

Lastly, we must mention the use of dipole moments. We saw earlier that molecular dipole moments are effective in determining intermolecular forces. But they also tell us something about the molecule. Thus if the dipole moment of CH_4 turns out to be zero (as it is) we can almost certainly reject the pyramidal model in Fig. 8b: it would be almost unbelievable that the electrons would be attracted absolutely equally to the carbon and the hydrogens. Similarly from the facts that the dipole moment of water is not zero, and that of CO_2 is zero, we are led to the angular shape of Fig. 10a for H_2O and the linear shape for CO_2 .

Theoretical Molecular Structure.—The explanation of many of the structural details just mentioned could not be seriously considered until

1927. In the early days the internal structure of an atom (See ATOMIC THEORY) was unknown. How could anyone hope to know the structure of a molecule? When the electron was discovered and identified in 1897 by J. J. Thomson at the Cavendish Laboratory, Cambridge, England, it became clear that the mechanism whereby atoms exert forces on each other was essentially electronic. This led to a series of models, due to I. Langmuir and others, in which an attempt was made to locate certain electrons—the outer ones, sometimes called valence-shell electrons—at the vertices of a cube surrounding each atom. So some of the electrons would appear to "belong" to two or more atoms, and, by extrapolation from the case of the rare-gas atoms (helium, neon etc.) which appeared to be so stable as not to form compounds, and which were characterized by the presence of 8 electrons in their outer shell, it was postulated that each atom would seek to attach other atoms to itself in such a way and of such a number that it would complete its octet of electrons at the corners of the imaginary cube around it. Models of this kind, however ingenious, are unsatisfactory because a stationary electrical distribution of such a type can be shown to be unstable.

The next fundamental step was due to G. N. Lewis of California. In 1916 he made the important observation that practically all single bonds (as in H—O—H or H—Cl) could be regarded as involving two electrons. As a general rule one electron came from each of the two atoms at the ends of the bond, though in certain special cases (called donor bonds) both electrons could come from one of the atoms. These two electrons were said to be shared between the atoms. With double bonds four electrons were involved and with triple bonds six electrons. As a result of this sharing process each atom such as O, Cl, completed an octet of electrons, and H a duplet. In HCl , for example, the H atom provides just one electron, but the Cl atom has 7 electrons in its outer, valence shell (this is the M-shell). By sharing one of these 7 with H, the Cl atom acquires an interest in 8 electrons, the H atom acquires an interest in 2 electrons, and both the octet and the duplet are complete. In H—O—H the O atom has 6 valence-shell electrons, and by sharing one each with the two H atoms, it acquires its necessary total of 8. If it attempted to add on a third H atom, to form a hypothetical H_3O , it would find itself with an interest in 9 electrons, contrary to the rule. This model explains the saturation of valence, though of course it says nothing about size or shape. It is interesting to notice that in fact oxygen can attach itself to three hydrogen atoms provided that it first becomes ionized by giving up an electron. Thus the ion H_3O^+ with one net positive charge, is present very widely when an acid is dissolved in water. (See ACID). In $\text{O}=\text{C}=\text{O}$ we preserve the octet rule for both O and C by supposing that in each bond a total of four electrons are involved. This is in agreement with their designations as double bonds.

The next important step was the introduction of wave mechanics in 1926 by Erwin Schrödinger. For the first time it became possible to say what was meant by the term electron distribution in an atom or a molecule. One result of the Uncertainty Principle of W. Heisenberg (see QUANTUM THEORY) was that on account of its small mass it was not possible to follow an elec-

tron in its orbital path, so that some new mode of description was necessary. The mode which is most common in chemical problems is that of the charge-cloud, similar in some respects to a city fog; the cloud is not equally dense everywhere, and for an atom or a molecule its density decreases as we move away from the neighborhood of the nuclei. We interpret the cloud as telling us the probability that if we could instantaneously photograph the atom or the molecule, we should find the electron in any chosen small region. The density of the cloud is proportional to the probability. The density itself is found from the wave function, which in its turn is found as the solution to the appropriate Schrödinger Wave Equation. So, in order to calculate the distribution of charge we (a) set up the appropriate wave equation, (b) solve it to get the wave function ψ , (c) write ψ^2 as the density of our charge-cloud. On the average it is as if each electron were itself smeared out into a volume distribution of electric charge, and the density of this charge is given by the square of the calculated wave function.

So far as an atom is concerned, this process gives us the charge-clouds which correspond to the distinct energy levels which are allowed for this atom. It is unfortunate that except for the one-electron problem, the wave equation is too complicated to be solved exactly. Consequently

Fig. 11. Atomic orbitals, showing (A) *s*-type, with spherical symmetry, (B) and (C) *p*-type, with axial symmetry, (D) *d*-type, with four regions of high charge-cloud density. In each case the central dot denotes the position of the nucleus of the atom.

various approximations to the solution have to be obtained; and various mathematical techniques exist for getting better and better approximations. When the individual electron levels have been obtained, the Pauli Exclusion Principle is applied. This principle allows us to put not more than two electrons into each of the calculated energy levels. If we have two electrons in a charge-cloud pattern (now usually called an orbital, since it replaces the older notion of an orbital path) these two electrons must have their spins antiparallel, that is, opposed to each other. In the lowest state of the atom as a whole we simply calculate the allowed orbital energies, and then feed in electrons, two at a time, beginning with the level of lowest energy, until all our available electrons are used up.

With molecules a similar situation obtains. In the first place it is easy to show that all the inner-shell electrons of the atoms are effectively unchanged as a result of a molecule being formed. These electrons have monocentric orbitals such as those of Fig. 11. But at least some of the valence-shell electrons have orbitals which, to a high degree of accuracy, can be thought of as bicentric. Since each orbital can accommodate two electrons, with opposed spins, this shows that two electrons can have an orbital associated with a pair of adjacent atoms; these two electrons together constitute G. N. Lewis' electron-pair bond. And we can see that the deepest explanation

which is possible for the existence of an electron-pair bond is in the application of the Exclusion Principle to the idea of orbitals.

In molecular hydrogen (H_2) there are only two electrons and the charge-cloud is of the form shown in Fig. 12. As the bond is due to two electrons it is a single bond, and like almost all normal single bonds the charge-cloud is axially symmetrical, that is, has cylindrical symmetry around the line of the bond.

In HCl the charge-clouds for the K- and L- shells of chlorine are just as in the isolated Cl atom. The bond is associated with two electrons whose charge-cloud pattern resembles that of Fig. 13. Other electrons in the valence-shell of chlorine have orbitals closely similar to the

Fig. 12. Charge-cloud for molecular H_2 . Thick dots denote positions of the two nuclei. Notice symmetry around the axis, and the closeness with which this diagram resembles the superposition of two diagrams such as in Fig. 11a.

isolated atom orbitals. It is of great significance that the charge-cloud for the bonding electrons is not very different from that due to a superposition of a hydrogen atomic orbital (an *s*-type orbital, see Fig. 11a) and a chlorine atomic orbital (a *p*-type orbital, see Fig. 11b). For this reason we say that the hydrogen electron has been paired with the chlorine electron to form the bond. Now the only orbitals that may be used in this way are those which are not already doubly filled. Hence the valence number of an atom is equal to the number of unpaired electrons in the atom. Nitrogen, for example, is triatomic (Fig. 10b) because there are three unpaired electrons in the outer shell of the isolated N atom.

Finally, in H_2O , we have atomic nonbonding electrons round the O atom, and their two

Fig. 13. Charge-cloud for molecule H-Cl. Notice symmetry around the axis, and the closeness with which this diagram resembles a superposition of diagrams such as in Figs. 11a and 11b.

charge-clouds, similar in shape and size, one for each O—H bond. (See Fig. 14.) Each separate charge-cloud resembles the superposition of a hydrogen *s*-type orbital and an oxygen *p*-type orbital. Now it may be shown that the available *p*-type orbitals in an atom—we need two of them here for the two bonds—are naturally directed at right angles to each other. This, as Linus Pauling showed in 1931, gives us insight into the reason why the angle $H-O-H$ is not 180° , but is nearer to 90° . Indeed the whole basis of stereochemistry lies in considerations analogous to these.

We can also see why bonds are so nearly constant, in length and energy. For if, in H_2O we replaced one H atom by another group, such as C_2H_5 , to give ethyl alcohol $H-O-C_2H_5$

Fig. 14. Schematic representation of the two charge-clouds that represent the two O—H bonds in water H—O—H. The cloud for each bond is similar in general pattern to that shown in Fig. 13, and is almost wholly localized within the volumes obtained by rotating each closed curve around the appropriate O—H axis.

there is no particular reason why the charge-cloud for the remaining H—O—region should be seriously modified. It is true that there will be small modification, so that the O—H bond is not really identical in all molecules. But the variations from molecule to molecule are not so large that they prevent us from drawing up tables of properties—length, energy, force constant, dipole moment and so on. It is also easy to see from diagrams such as those of Figs. 12–14 what is meant by the size and shape of a molecule, and the relation of all this to the van der Waals' radii mentioned earlier.

Enormous progress has been made in this since W. Heitler and F. London first introduced some of these ideas in 1927. We can now give a fairly detailed account of most simple molecules. For details the reader is referred to the standard works listed below. See also ELECTRON THEORY; STEREOCHEMISTRY; X-RAYS APPEND.

C. A. COULSON,

Mathematical Institute, Oxford University, England.

MOLECULE, mōl'ê-kûl, the smallest particle of a chemical substance capable of a separate existence.

MOLESKIN, originally the skin of moles used as fur, now a fabric so called from its softness like the skin of a mole, such as velveteen. It is a strong twilled cotton fabric, cropped or sheared before dyeing. In the United States the word is also applied to the padded breeches worn by football players.

MOLESWORTH, mōlz'wûrth, Mary Louisa (nee STEWART; pseudonym ENNIS GRAHAM), English writer: b. Rotterdam, Holland, May 29, 1839; d. London, England, July 1, 1921. Her first books, novels, were written under the pseudonym Ennis Graham, but she is known to children at the end of the 19th century as Mrs. Molesworth. Educated at home, and in Switzerland, she began writing at an early age. Among her most popular children's books were *Carrots* (1876) and *The Cuckoo Clock* (1877). Other books included *The Tapestry Room* (1879); *Peterkin* (1902); and *The Story of a Year* (1910).

MOLEY, mō'li, Raymond, American editor and author: b. Berea, Ohio, Sept. 27, 1886. Specializing in history, politics, and public law, Moley taught for some years in Ohio, became associate professor of government at Columbia University in 1923 and professor of public law there in 1928. As research director of the New York State Crime Commission (1926–1927) and research director of the New York State Commission on the Administration of Justice (1931–1933), he did a great deal of writing and research on criminal investigation both in the Middle West and in New York State, where he worked with Franklin D. Roosevelt, who was then governor. In 1933 for one year he was assistant secretary of state under Cordell Hull, and a member of the so-called "brain trust" consulted by Roosevelt as president. Resigning his office, he established and became editor of *Today*, a weekly magazine, printing in that magazine his increasing criticism of the New Deal, and publishing in 1939 *After Seven Years*, confirming this criticism. When *Today* was merged with *Newsweek* in 1937 he became associate editor and about the same time a news commentator on radio, and a syndicated columnist. Among his many books are: *Lessons in American Citizenship*... (10 editions, 1917–1930); *Our Criminal Courts* (1930); *Twenty Seven Masters of Politics* (1949); *How to Keep Our Liberty* (1952).

MOLFETTA, mōl-fêt'tā, city, Italy, in Bari Province, on the Adriatic, 15 miles northwest of Bari, with which it is connected by railroad. It has a magnificent Romanesque cathedral of the 13th century; a college; a well-sheltered harbor, and manufactures linen and saltpeter, exporting chiefly olive oil, corn, and almonds. Just outside the town are caves of archaeological interest. Pop. (1951) 55,922.

MOLIERE, mō-lyâr' (pseudonym of JEAN BAPTISTE POQUELIN), French dramatist: bap. Paris, France, Jan. 15, 1622; d. there, Feb. 17, 1673. When the elder Poquelin, who was *valet de chambre* and upholsterer to King Louis XIII, was no longer able to discharge that office, the son assumed his position, accompanying the king to Narbonne. The French theater had at that time begun to flourish as a result of the talents of the great Corneille, and young Poquelin, who had acquired a strong passion for the stage, now formed a company of young persons of similar tastes, changed his name to Molière, and resigned his father's office. His company soon attained recognition and he became head of a strolling troop which acted his first comedy in verse, *L'Étourdi* at Lyon, probably in 1653. The truth of the dialogue, the inexhaustible skill of a valet continually employed in rectifying the blunders of his master, have kept this play on the stage in spite of the want of connection between its parts. Molière gained equal applause as a poet and an actor, and drew all the spectators away from another company at Lyon. *L'Étourdi* was acted with equal applause in Béziers. Here the Prince de Conti, who had known Molière at school, had just assembled the estates of Languedoc. He received the poet as a friend, and entrusted to him the charge of amusing the town and the assembly. *Le Dépit amoureux* (1656) and *les Précieuses ridicules* (1659) were played in the theater of Béziers. In *Le Dépit amoureux* the actions show a genuine comic vein, and both incidents and language display much spirit and humor; but the plot is too com-

plicated, and the *dénouement* not sufficiently probable. The plot in the 'Précieuses ridicules' is more simple. A delicate satire on the prevailing affectation of the character of *bel esprit* and of a romantic style, on the pedantry of learned females, and affectation in language, thoughts and dress, is the object of this comedy. It produced a general reform after it was brought out in Paris. The spectators laughed, recognized themselves, and applauded. Louis XIV, well pleased with the performances of Molière's company, made it his own company, and gave its director a pension of 1,000 livres. 'Sganarelle' appeared in 1660. This piece also contains a fund of sportive humor, and keeps the spectators continually amused. Censure was not silent on its appearance, but was not listened to. 'Don Garcie de Navarre' (1661), in imitation of the Spanish, was criticized with more justice. It is a cold attempt at a more elevated style. 'L'Ecole des maris' (1661) the idea of which is drawn from the 'Adelphi' of Terence, contains a simple and entertaining plot and a natural *dénouement*. The theatre still resounded with the applause with which this piece was received, when 'Les fâcheux' (1661), projected, executed and committed to memory by the actors within a fortnight, was performed at Vaux at the residence of Fouquet, intendant of finances, in the presence of the king and court. This comedy is almost destitute of plot, but the intention was to interest the spectators by the multiplicity of characters, the truth of the portraits, and by the elegance of the language. It is said that the king, on going away from the first performance, happening to see the Count Soyecourt, a tiresome narrator of his exploits in the chase, said to Molière, "There is an original that you have not copied." In 24 hours the scene of the hunter was inserted; and as Molière was not acquainted with the terms of the chase, he requested Soyecourt himself to explain them to him. 'L'Ecole des femmes' (1662) met with critics, who, overlooking the art which prevails in the management of the inferior personages, and in the natural and quick transition from one surprise to another, animadverted upon some negligences of style. Molière answered them by his spirited 'Critique de l'école des femmes' (1663). The 'Impromptu de Versailles' was a reprisal occasioned by an attack of Boursault, who had written a piece against him, entitled 'Le portrait du peintre.' The court was much pleased in 1664 with 'La princesse d'Elide,' a comic ballet, prepared for an entertainment given by the king. Another ballet, 'Le mariage forcé,' is drawn from Rabelais. 'Don Juan' (1664), excited much reprehension by the impiety of some of the expressions placed in the mouth of the profligate hero. Molière retrenched the objectionable parts in the second representation. 'L'Amour médecin' (1665) is one of the over-hasty works which are not to be strictly criticized. It was written, studied and represented within five days. In this Molière for the first time attacks the physicians. His great piece, 'Le misanthrope' (1666), was but moderately well received at first, but in the sequel was justly considered as one of the finest productions of modern comedy. It has been more admired in the closet than it has pleased on the stage—the reason Voltaire believes to be because the plot

is delicate and ingenious rather than lively and interesting; because the dialogue, with all its beauty, does not always seem necessary and therefore retards the action; and because the *dénouement*, though skilfully introduced, leaves the spectator unexcited. In 1665 appeared 'Le médecin malgré lui,' a farce full of humor. 'Le Sicilien' (1667) is a short piece which pleases by its grace and gallantry. But his reputation was carried to its highest summit when 'Le Tartufe' appeared. Three acts of the comedy had been performed in May 1664 before the king; but its pointed wit gave great offense to all the ecclesiastical authorities, and it was not until 1669 that permission was given for adequate unexpurgated representation. This hypocrisy is fully unveiled, the characters are equally various and true, the dialogue is elegant and natural, the *dénouement* alone is unsatisfactory. An impious and obscene farce, entitled 'Scaramouche,' having been represented at court, the king said to the great Condé, as he was leaving the theatre in his company, "I should like to know why the people, who are so much scandalized at Molière, say nothing about 'Scaramouche.'" "The reason is," replied the prince, "that 'Scaramouche' ridicules only God and religion, about which these people care nothing, while Molière's piece ridicules themselves." In 1668 Molière published his 'Amphitryon,' a free imitation of Plautus. With the exception of a tedious scene between Jupiter and Alcmena, nothing can be more humorous. 'L'Avare' (the Miser), an imitation of the 'Aulularia' of Plautus, is, in the leading character, a little overdone; but the multitude is only to be struck by strong traits ('George Dandin'; 'Monsieur de Pourceaugnac'; 'Les Fourberies de Scapin,' are rather amusing than instructive. 'Le Bourgeois Gentilhomme,' though mixed with some buffoneries, is full of power. Molière bestowed more care on his 'Femmes Savantes,' a witty satire on affected taste and pedantic learning, which at that time prevailed in the Hôtel de Rambouillet. The incidents are not all well connected; but the subject, dry as it may be in itself, is exhibited in a truly comic form. The development is admirable, and has been a hundred times imitated. The same is true of the 'Malade imaginaire,' in which the quackery and pedantry of the physicians of the times are fully delineated. With this piece the author concluded his career. He was indisposed when it was performed, and the exertion with which he played produced convulsions, followed by a hemorrhage, and he died after the lapse of a few hours. The archbishop of Paris at first refused him burial; but the king himself insisted on it, and he was interred in the cemetery behind the chapel of Saint Joseph, Rue Montmartre. In 1792 his remains were transferred to the Museum of French Monuments whence in 1817 they were removed to Père Lachaise.

Molière is the true father of French comedy. His works may be considered as a history of the manners, fashions and tastes of his times, and as the most faithful pictures of human life. Born with an observing mind, skilful in catching the outward marks of the passions and emotions, he took men as they were, and, with singular felicity, exhibited the most sacred recesses of their hearts, and the tone, the action

and the language of their various feelings. Of all who have ever written, Molière is the one who has best observed men without seeming to do so. His knowledge of human character seems to have come by intuition. In his domestic relations Molière was not fully happy; he who made merry on the stage with the weaknesses of other men could not guard against his own weakness. A violent passion induced him marry the daughter of the actress Béjart, and he thereby incurred the ridicule he had so often cast on husbands of a disproportioned age. As an actor Molière was not to be surpassed in high comic parts, such as Arnolphe, Orgon, Harpagon, etc. An edition of Molière published at Paris in 1838 gave the actors' names after the *dramatis personæ*, from which we learn that Molière always played the principal comic parts himself. Among the last and best editions are those of Monval (8 vols. 1882); A. France (7 vols., 1876-91); and Desfossés and Mesnard (11 vols., 1873-93). See DON JUAN; LEARNED LADIES, THE; MISANTHROPE, THE; TARTUFFE. MOLINA, mō-lē-nā, Alonso de, Spanish missionary: b. Escalona (Toledo), Spain, about 1510; d. Mexico, 1584. He accompanied his parents to San Domingo, and in 1523 went to Mexico, where he learned the Aztec language and acted as interpreter to the Franciscan monks, whose order he subsequently joined engaged in missionary work, in which he was very successful. He was superior of the province of Santo Evangelio, and his books are among the earliest printed in America. Among them are 'Diccionario de la lengua Castellana y Mexicana' (1555); 'Arte de la lengua Mexicana' (1578); and several works in the Aztec language.

MOLINA, Juan Ignacio, Chilean naturalist and historian: b. province of Talca, Chile, 24 June 1737; d. Bologna, Italy, 12 Sept. 1829. He was educated in the Jesuit College at Santiago, and entering the order after its expulsion from America in 1767, settled in Italy. After 1774 he lived at Bologna, teaching and writing. He published 'Compendium of Chilean History' (1776); 'Essay on Chilean Natural History' (1782); 'Essay on Chilean Civil History' (1787), the last-named being translated into several languages, including English, etc.

MOLINA, Luis, Spanish Jesuit: b. Cuenca, New Castile, 1535; d. Madrid, 12 Oct. 1600. He entered the Jesuit Order (1553), was appointed (1570) teacher of theology at Evora, but turned to literary work (1590) and died on after being called to the chair of moral theology at Madrid. His most important work 'Liberi arbitrii cum gratiae donis, etc., conprobanda' (Lisbon 1588), which made him famous and created a great controversy; the Domini-

cans contested his views as antithomistic, but many Jesuits (Molinists) defended him with the consequence that a quarrel ensued that ended in the Jansenist dispute. Consult Schneemann, 'Die Entstehung der thomistische molinistischen Kontroverse' (Frieburg 1879-80); Régnon, Th. de, 'Bannésianisme et Molinisme' (Paris 1890); Gayraud, 'Thomisme et Molinisme' (Toulouse 1890-92).

MOLINA, Olegario, Mexican statesman: b. Bolonchenticul, Campeche, 1843. He was educated in the Seminary of San Ildefonso, Merida, where he subsequently became a professor. Later he founded in Merida a school of primary and secondary instruction, and still later a benevolent society known as 'The Youth.' During this period he established and conducted two journals, *La Guirnalda* and *Yucatan*; was elected to the Merida city council and later served one term in the national Congress. Returning to Yucatan he served as fiscal magistrate of the superior court of the state till in 1877 he took charge of the construction of the first railway in Yucatan, — the line which connects the cities of Merida and Progreso, — completing it in two years notwithstanding most discouraging conditions, and afterward and until 1881 operating it as manager. In the latter year he organized the present commission and banking house of O. Molina and Company. In 1902 he was elected governor of his state for the four years ending 1906, when he was re-elected. Owing to ill health he retired from the governorship at the end of the first year of his second term. In March 1907 he was appointed by President Díaz to the Cabinet position of Secretary of Fomento, colonization and industry. During his five years' service as governor Mr. Molina introduced and successfully carried through many important public improvements and reforms in the several departments of government, greatly advanced the cause of education, stamped out yellow fever at Merida and built a fine general hospital and an asylum for the insane.

MOLINA, Tirso de. See TÉLLEZ, GABRIEL.

MOLINARI, mō-lē-nā-rē, Gustave de, Belgian political economist: b. Liège, Belgium, 3 March 1819; d. 1911. He studied medicine and became a homœopathic physician in Brussels, but upon removing to Paris he entered journalism. His reputation as a radical compelled him to return to Belgium upon the accession of Napoleon III and he was appointed to the chair of political economy in the Musée Royal d'Industrie Belge. In 1881 he returned to Paris and edited the *Journal des Economistes* and later founded the journals *L'Economiste Belge* and *La Bourse du Travail*. Among his books are 'Études économiques' (1846); 'Cours d'Economie politique' (1861); 'L'Évolution économique' (1880); 'Comment se resoudra la question sociale' (1896), etc.

MOLINE, mō-lēn', Ill., city in Rock Island County, alt. 586 feet, on the Mississippi River, the Chicago, Rock Island and Pacific; Chicago, Burlington and Quincy; and Chicago, Milwaukee, St. Paul and Pacific railroads, and on many important highways; adjoining East Moline and Rock Island, and directly across

the river from Davenport, Iowa. It is located about 165 miles southwest of Chicago. Moline has a fine airport, city-owned, with airline service by Braniff, Ozark, and United airlines. The immediately surrounding area is agricultural, but there are extensive coal fields near by. Together with Rock Island, the city constitutes the greatest center in the United States for the manufacture of farm implements, with such companies as Deere and International Harvester operating on a major scale. Other industrial products include electrical equipment, machinery, foundry products, machine tools, rubber products, wood products, sporting goods, and clothing. An early major river port, Moline's industrial growth began after the decline in Mississippi steamboating in the latter part of the 19th century. It was settled about 1832, platted in 1843, and incorporated as a town in 1848 and as a city in 1872. Pop. (1950) 37,397.

MOLINET, mô-lê-ně', or **MOULINET**, Jean, French poet and chronicler: b. Desvres, 1433; d. Valenciennes, Aug. 23, 1507. He followed Georges Chastellain as chronicler of the house of Burgundy and continued Chastellain's chronicle through the years 1474 to 1504. He also became librarian to Margaret of Austria, governor of the Low Countries. In 1501 he was made canon of the church of Valenciennes. An important representative of the "Rhétoriqueurs," a Burgundian school of poetry which favored an affected, rhetorical, pedantic style, he also translated into prose the *Roman de la Rose*. A volume of his poems was printed in 1531, and his chronicles were published in 1828.

MOLINO DEL REY, mô-lê-nô thêl rê'ê; -râ'. **Battle of**, occurred during the Mexican War a few miles southwest of Mexico City on Sept. 8, 1847. Having captured Veracruz (q.v.) in March of 1847, Gen. Winfield Scott (q.v.) continued on toward his objective point, Mexico City, and on the way fought and defeated the Mexicans in the battles of Cerro Gordo, Contreras, and Churubusco (qq.v.). In order not to hinder the peace negotiations then under way, Scott, on Aug. 24, 1847, arranged an armistice with the Mexican general, Antonio López de Santa Anna (q.v.), but Scott soon learned that, in spite of his pledge to the contrary, Santa Anna was strengthening his fortifications, casting cannon from old church bells, and in other ways preparing for a resumption of hostilities. On September 6, therefore, Scott ordered such activities to cease on pain of suspending the armistice and proceeding with his attacks. The next day Santa Anna replied accepting the latter alternative, whereupon, on the night of the 7th, Scott drew up his troops preparatory to attacking the Mexican forces.

Scott's troops were divided under Gen. John A. Quitman (q.v.), Gen. David E. Twiggs, Gen. Gideon J. Pillow (q.v.), and Gen. William J. Worth (q.v.), the last of whom was at Tacubaya, where Scott himself had his headquarters. A mile or so away was a cluster of stone buildings known as El Molino del Rey, which was believed to have been used as a gun foundry. A short distance west of Molino was La Casa Mata, a strong stone building defended by an earthwork. Between the two lay Mexican batteries and infantry, and west of Casa Mata at Hacienda de los Morales another body of Mexicans was lodged. At about four o'clock on the morning of Septem-

ber 8, Worth's division began the assault on the Mexican center and left. The American artillery thundered against the walls and the advanced batteries of Molino del Rey. Despite a desperate rally of the Mexicans, Molino del Rey was soon taken, though not without much bloodshed.

Casa Mata, however, proved to be a greater stumbling block, since, being surrounded with bastioned entrenchments and deep ditches, it afforded excellent protection against an assaulting column. The first American assault was repulsed but after Molino had been captured, all the American guns were brought to bear on Casa Mata. As the garrison was cut off from all support and exposed to a most destructive fire, the place was evacuated; two attempts were made to recover the lost position but nothing could face the artillery fire of the Americans. By nine o'clock in the morning the battle was over. Casa Mata was then blown up, and the troops were marched to Tacubaya to prepare for the final assault on Chapultepec (q.v.). The Americans engaged in this battle numbered less than 3,500 of whom 787 were killed or wounded; the Mexican forces numbered at least 10,000 men of whom about 3,000 were killed, wounded, or taken as prisoners.

Consult Smith, Justin, *The War with Mexico* (New York 1919); Elliott, Charles W., *Winfield Scott* (New York 1937); and Henry, R. S., *Story of the Mexican War* (Indianapolis 1950).

MOLINOS, mô-lê-nôs, Miguel de, Spanish mystic and founder of Quietism: b. near Saragossa, Dec. 21, 1640; d. Rome, Dec. 28, 1696. He was ordained as a priest in Valencia and ministered there until he went to Rome about 1669. There in 1675 he published his *Guida Spirituale* which urged that the soul cannot begin to approach God until it is free from all that is material, and only through such a disinterested love, with the soul in a state of contemplative passivity, can union with God be attained leading to peace and salvation. His opponents, notably the Jesuits, held that this doctrine meant indifference by the individual to the external world, that it opposed the practices of the church, and that it excused licentiousness. In 1685 he was summoned before the Inquisition; two years later he was found guilty of spreading dangerous doctrines, and his teachings were condemned by a bull of Innocent XI. He publicly recanted all his teachings but was kept imprisoned until his death. See QUIETISM.

Consult Bigelow, John, *Molinos, the Quietist* (New York 1882).

MOLL FLANDERS, *The Fortunes and Misfortunes of*, a realistic novel by Daniel Defoe. First published in 1722, the novel is in the form of an autobiography and tells the story of Moll Flanders' adventurous and disreputable life. Moll, who was born in prison and abandoned as a child, is brought up in the house of the mayor of Colchester. Her life soon becomes well filled with five marriages and a colorful career as a pickpocket, thief, and prostitute. Eventually, however, she is transported to Virginia, where she manages to become a planter and also inherits a plantation from her mother. Rich and respectable in her old age, she finally becomes honest and penitent. The novel is so realistic in detail—as, for example, when Moll makes a lengthy inventory of the goods which she is taking with her to America—that it makes a good source

document for knowledge of the life of the times.

MOLLENDO, mô-yân'dò, city, Peru, a seaport on the Pacific coast, located in the Department of Arequipa, about 50 miles southwest of Arequipa on the Pan American Highway. A railroad connects it with Puno on Lake Titicaca. Formerly the chief coastal port for southern Peru and Bolivia, it has largely been replaced by the new and safer port facilities completed in 1941 seven miles to the north at Matarani. Among its industries are textiles, flour milling, shoe and furniture manufacturing, and fish canning. The chief export of the region is alpaca wool. Pop. (1948 est.) 14,606.

MOLLENDORF, mùl'ën-dôrf, **Wichard Joachim Heinrich von**, Prussian general: b. Linden-berg, Germany, Jan. 7, 1724; d. Havelberg, Jan. 28, 1816. He distinguished himself in the service of Frederick II (the Great) during the Seven Years' War, especially in the battles of Muthen, Hochkirk, and Torgau; and, remaining in the Prussian military service, rose to the rank of general field marshal in 1793. The next year Mollendorf commanded the Prussian Army on the Rhine and won the Battle of Kaiserslautern against the French Republic. During the Napoleonic Wars he was wounded at Auerstedt (1806), captured, and after his release, retired from active duty. He was noted as a pioneer in seeking more humane treatment of common soldiers.

MOLLENHAUER, möl'ën-hou-ër, **Emil**, American violinist and conductor: b. Brooklyn, N. Y., Aug. 4, 1855; d. Boston, Mass., Dec. 10, 1927. Mollenhauer began his musical career very early, playing the violin in Booth's Theatre Orchestra in New York, when only 14, and joining the Theodore Thomas Orchestra there as a first violinist at 16. In 1884 he moved to Boston, where for four years he was a member of the Boston Symphony Orchestra. He then became conductor of the Germania Orchestra, with which he frequently toured the United States. At the St. Louis Exposition in 1904, and at the Panama-Pacific Exposition in San Francisco in 1915, he conducted the concerts given by the Boston Symphony Orchestra. In 1899 he was chosen conductor of the Handel and Haydn Society, and in 1901 of the Apollo Club, posts which he retained until the year of his death.

MOLLHAUSEN, mùl'hau-zën, (**Heinrich**) **Allduin**, German traveler and writer: b. Bonn, Germany, Jan. 27, 1825; d. Berlin, May 28, 1905. The son of a Prussian army officer and engineer, Mollhausen went to the United States in 1849, and joined a scientific expedition headed by Duke Paul William of Württemberg to explore the Rocky Mountains. The expedition failed because of the hostility of the Indians, and Mollhausen experienced many hardships. He returned to America in 1853, however, and was chosen by the United States government to serve as topographer on an expedition surveying a course for a railroad to the Pacific coast. Back in Germany in 1854, he was given the post of custodian of the royal libraries in Potsdam. He visited America once more in 1857-1858, when he was sent out by the government to explore the Colorado River. He subsequently wrote some 45 full-length novels and travel books and many shorter stories, most of them dealing with American Indian and pioneer

life. On the basis of these writings, he is frequently referred to as the German Cooper.

MOLLIEN, mô-lyän', **COMTE François Nicolas**, French statesman: b. Rouen, France, Feb. 28, 1758; d. Paris, 1850. Before the French Revolution, Mollien held various positions in the ministry of finance, including that of supervisor of the farmers-general of taxes. In 1786 he negotiated a commercial treaty with England, which abolished many restrictions on needed imports. Imprisoned for a short time during the revolution in 1794, he went to England, returning to the ministry of finance in 1799, after Napoleon's seizure of power. Recognizing his financial ability, Napoleon made him a counselor of state in 1804, and in 1806 minister of the treasury, in which capacity he assisted in reorganizing the banking system of France. During the Hundred Days he was again minister of the treasury, but although he was consulted on budgetary problems by succeeding rulers, he refused office after 1815. He wrote *Mémoires d'un ministre du Trésor*, 4 vols. (1845).

MOLLISON, möl'i-s'n, **James Allan**, British aviator: b. Lanarkshire, Scotland, April 19, 1905. Commissioned in the Royal Air Force in 1923, he established numerous flying records, including the Australia-England record (8 days, 19 hours, 28 minutes) in 1931, and the England-Cape of Good Hope record (4 days, 17 hours, 5 minutes) in 1932. In the latter year he also made the first solo flight westward across the North Atlantic, and in February 1933 the first England-South America flight. In July 1933, accompanied by his first wife, Amy Johnson, he made the first England-United States crossing, and in 1934 they made the England-India record of 22 hours. During World War II Mollison was an airplane ferry pilot. He has written two volumes of autobiography: *Death Cometh Soon or Late* (1932) and *Playboy of the Air* (1937).

MOLLN, müln, town, western Germany, in the State of Schleswig-Holstein, on the Elbe-Trave Canal, 16 miles south of Lübeck. An ancient place whose records go back to 1188, Mölln was chartered as a town in 1220, as a city in 1254, and from 1359-1683 was a possession of Lübeck. It manufactures chemicals, textiles, furniture, and mattresses, and processes food. Till Eulenspiegel, the legendary comic hero, is supposed to have died here. Pop. (1946) 12,907.

MOLLUSCA, mô-lüs'ká, one of the great divisions or phyla of the animal kingdom, containing the oysters, clams, snails, slugs, squids, and octopus as well as the chitons and tusk shells. The class is characterized by having a mantle which secretes the shell and a radula or food-rasping organ. Both of these organs are peculiar to this group of animals. The body is primarily bilaterally symmetrical with the mouth and anus at the two ends of the body, the alimentary canal traversing it as an axis. However, the bilateral symmetry in the Gastropoda or snails is frequently obscured by a secondary change of a torsional nature. On the lower surface of the body there is developed a muscular organ, the foot, which is the organ of locomotion. This has been modified in the Cephalopoda to become the tentacles and the funnel, and in the Pelecypoda it has become a digging or plowing organ.

The outer surface of the body is encased by a pallium or mantle. This organ is attached dorsally and more or less open ventrally. The cavity between the mantle and the visceral mass is the mantle cavity in which the gills are developed. In the Pulmonata the gills disappear and a sac, the pulmonary sac, is developed in the body which is surrounded by blood vessels and functions as a lung. The outer surface of the mantle develops the shell which is present in most mollusks. This latter morphological structure exhibits an enormous number of modifications among all classes, orders, and families. Even below the family level down to the individual species, shell structure, color, and sculpture exhibit a nearly endless series of differences.

In many groups the posterior and dorsal surface of the foot bears a horny or calcareous plate, the operculum. When the animal retracts within the shell, the operculum closes the aperture. In several groups, the shell is reduced to a remnant, generally internal as in the slugs, or to a chitinated rod in the squids. It may be entirely lacking in the adults of some forms as in the nudibranchs, a group of marine mollusks.

In all mollusks, other than the bivalves, the mouth contains a remarkable structure, the radula. This consists of a band possessing a series of hooklike structures, the teeth, on its upper surface. These teeth exist in transverse rows and vary greatly in the different classes, orders, and families. The number and shape of the teeth play a very important part in the classification of the various groups, especially in the class Gastropoda. When feeding, the radula is extruded to the mouth opening and by means of strong muscles is pulled rapidly back and forth. It acts as a file in principle, rasping away particles of food, either animal or vegetable, depending upon the food requirements of the family or order to which the species may belong.

In a restricted group of the Gastropoda, the suborder Toxoglossa, the radula has become modified as a poison apparatus. The individual teeth have become elongate and spear-shaped and, in addition, associated with a poison gland. The teeth, as barbs, deliver the poison into the victim. Paralysis and death may soon follow. More than 20 deaths are known to have occurred among humans bitten by members of this group, all caused by species belonging to the family Conidae. The action of the poison is rapid, a death occurring in Queensland, Australia, only four and one half hours after the victim was bitten.

Mantle and Foot.—Typically the mantle is a paired structure, but in most groups the two halves unite in front and behind. This has its effect upon the shell, since, where the lobes are separate, there are two halves or valves to the shell, but where united there is but a single (univalve) shell. Sometimes this univalve shell is a straight cone, but, while conical, it is usually coiled in a spiral, a part of the body extending toward the apex of the cone. As the animal increases in size, the shell also increases in thickness and extent, the successive additions being usually recognizable on the external surface by lines of growth which run parallel to the free edge of the shell. When the edge of the mantle is provided with projections or lobes, these cause ridges or protuberances on the surface of the shell. When the mantle is colored (striped or spotted), the color pattern is reproduced in the shell, since pigment from the mantle is deposited along with

the carbonate of lime. On the outside of the shell there is usually a thin organic cuticle and beneath this two layers of carbonate of lime. Sometimes the inner layer consists of thin lamellae parallel to the surface, the free edges of which produce diffraction spectra and thus give the inside of the shell an iridescent appearance—mother-of-pearl. (See PEARL.)

In the bivalve shell (see BIVALVES) an elastic hinge ligament connects the two valves and causes them to open. The valves are closed by muscles (the adductors), one or two in number, which extend across the body from valve to valve. In the univalves there is always a muscle attached to the inside on the axis of the shell, by the contraction of which the animal is retracted into the shell, the foot being the last part to withdraw. On the other hand, the shell is often greatly reduced and may become internal, as in the slugs and squids; or it may be entirely absent in the adult, as in the naked mollusks (naked branches) although it is formed in the young then later lost.

Digestive Organs.—The alimentary canal is typically a straight tube, but in most forms it becomes convoluted to increase the amount of digestive surface. Not infrequently it is so flexed upon itself that the mouth and anus, instead of being at opposite ends of the body, are in close proximity to each other. Behind the gullet there is a large saclike stomach and closely connected with it are the ducts of the large digestive gland. The intestine is long and without enlargement.

Circulation.—The heart lies dorsal to the digestive tract enclosed in a special sac, the pericardium, which is to be regarded as the sole representative of the true body cavity or coelom. In the heart, two parts are always to be distinguished, a muscular ventricle which forces the blood through the arteries to all parts of the body, and usually two auricles which receive the blood as it comes from the gills and force it into the ventricle. The heart thus receives only oxidized blood. With the loss of the gill on one side of the body, the corresponding auricle disappears. When four gills are present, as in the genus *Nautilus*, there are four auricles.

Gills.—The gills are true ctenidia or branchial structures of various kinds. By means of cilia, water in the mantle cavity is kept in circulation. In many bivalves the gills function as marsupia, retaining the eggs until they are hatched. In addition the outer surface of the gills collects the fine food particles captured in mucus, and by means of cilia these captured food particles are led into food grooves and eventually are carried to the mouth.

Structure of the Shell.—The shell is composed usually of three layers. The outermost, the periostracum, is made up of organic material called conchiolin, which is allied to chitin. The middle layer is composed of prismatic cells of calcite, and the inner surface, the laminated or nacreous layer, is composed of aragonite. There is, however, in these two layers, a matrix of conchiolin, in which the mineral salts, mainly calcium carbonate, are impregnated.

Reproduction.—So far as known, all land pulmonates are hermaphroditic, each individual containing both sexes. However, mating generally takes place between two individuals, either as a reciprocal process or with one functioning as male and the other as a female. In most marine snails the sexes are separate. Eggs are produced either

MOLLUSCA

From "American Seashells" by R. Tucker Abbott, published by D. Van Nostrand Company, Inc.

THE FIVE CLASSES OF MOLLUSKS

- (a) *Gastropoda*: Turnip whelk. (b) *Pelecypoda*: Calico clam. (c) *Cephalopoda*: Paper nautilus. (d) *Amphineura*: West Indian chiton. (e) *Scaphopoda*: Dall's Pacific tusk.

MOLLUSCA

A group of mollusks found in the Western Atlantic area: a, Van Hyning's cockle (*Dinocardium robustum* Clench and L. C. Smith), x 1/2; b, Georgette's wentlettrap (*Epitonium georgettina* Kiener), x 2; c, disk dosin (*Dosinia discus* Reeve), actual size; d, common fig shell (*Ficus communis* Röding), x 3/4; e, Scotch bonnet (*Phalium Born*), x 1/2; f, junonia (*Scaphella junonia* Shaw), x 1/2; g, angel wing (*Cyrtopleura costata* Linné), actual size.

in gelatinous masses or encapsulated within a chitinated case. In the latter, the free-swimming stage is generally passed within the capsule, the young emerging as young snails with the shell well developed. Many, if not most, of the marine bivalves give birth to their young at a very early stage, the two larval stages, the trochophore and veliger, developing in the water. These two larval or free-swimming stages have made possible a very wide dispersal, as they are subject to the movements of currents. Species with long larval life may be carried for hundreds of miles. It is for this reason that buoys, ships, and marine installations are soon covered with many kinds of mollusks as well as other organisms even when stationed far at sea. Most of the freshwater mussels have a parasitic stage, the young attaching themselves to the fins and gills of fish. Here for short or long periods of time, depending upon the species, the young derive sustenance from their fish host. At the end of their parasitic stage they drop from their host and begin to live as young bivalves in the mud and sand of lakes, ponds, and rivers.

Habits.—The mollusks are among the most adaptive of all animal groups. They are found in the great ocean deeps, in depths of over 30,000 feet (bivalves), and are known to occur up to 18,000 feet on mountain ranges (land gastropods), a vertical range of more than 9 miles. They have succeeded in occupying nearly every type of environment other than the air, and even here they have been partially successful, depending in part upon wind-blown debris to carry their eggs and even the adults over considerable territory. Their one limiting factor is lime; from this they build their shells and as there are few regions completely devoid of lime, there are few areas completely devoid of mollusks.

Most land shells are secretive in habit, hiding under leaves, boards, or other debris, particularly during dry periods. They are mainly active at night when most of their feeding is done. In many tropical areas several groups of land shells live in trees, feeding mainly upon lichens which are on the bark of the trees. With few exceptions, these tree snails are highly colored and certain of them, like the genus *Polymita* of eastern Asia, are the most highly colored snails that exist, exceeding even the vivid coloration developed by many marine snails. Other land snails live only on limestone rocks and these, like the tree snails, feed on lichens.

Freshwater mollusks have many types of habitat, most preferring the quiet water among reeds and other aquatic plants. Others prefer the swift water of shoals and rapids, living on rocks and stones and feeding upon the algae.

Marine snails accept a very wide variety of habitats, living on and under rocks or in and around coral reefs. Others, notably the bivalves, prefer sandy and muddy bottoms where they lie buried. The depth in which they live is generally governed by the extent to which they can extend their siphons. Many others bore or drill into rocks, heavy clay, and wood. A few of the marine mollusks, particularly certain Cephalopods, are pelagic, living in the open sea hundreds of miles from any shore line. Others are to be found in the great deeps. The ecological area which includes the largest number of mollusks in any one region is that which extends from near low water to depths of about 50 fathoms, as this situa-

tion furnishes the optimum in protection and food. In general, tropical areas are the richest in number of species, and in these warm waters the most colorful species are also found. In colder waters, though the number of species is not so great, individuals of a few species may exist in great abundance. Most mollusks are plant feeders, living either upon live vegetation or upon decaying plant tissue. A few groups are carnivorous and feed mainly on other mollusks.

Economic Importance.—Mollusks play a very important part in the economy of man. As beneficial organisms they supply considerable food along most shore lines of the world. In addition they are a prime factor as food for many of the important food fish. Others, such as the pearl oyster, supply us with pearls and shells for various types of jewelry. Many species of freshwater mussels are the main source of nacre for the pearl button industry. On the other hand, a few groups, like the shipworms (family Terebridae), are among man's most destructive enemies. These are highly specialized marine clams which have become greatly modified for boring into wood, including wharf pilings and other marine structures, as well as rope and even marine cables. The financial loss from damage done to such structures and to wooden boats and vessels far exceeds the financial gain from all other beneficially-important mollusks.

Several fresh-water species and even a few land species are involved as secondary hosts for trematode worms, the blood and liver flukes which cause schistosomiasis, one of the dreaded diseases, of the tropics and some temperate regions. In the life cycle of these trematodes, usually a single, or at most only a few, species of fresh-water snails act as secondary hosts, the primary host being some vertebrate. Larval stages of these parasites, after leaving their snail host, enter the primary host through the skin and then enter the blood system. Though different kinds of trematodes select different primary hosts, any trematode that affects mammals can usually affect man. The snail is the most important target of control measures. Once the snail is eliminated from a region, the disease is under control.

Classification.—The Mollusca are divided into five classes based upon the modification of the foot or locomotor organ as well as the diversification of other morphological structures.

Class AMPHINEURA. Chitons or coat-of-mail shells. All members of this class are marine.

1. Order POLYPLACOPHORA. This order contains most of the existing species. The shell is composed of eight plates which are covered or held together by a thick, fleshy portion of the mantle, the girdle.

2. Order APLACOPHORA. These are small wormlike animals without shells. The foot is reduced or lacking, and there are calcareous spicules imbedded in the mantle. They live mainly in deep water.

Class SCAPHOPODA. Tusk shells. All members of this class are marine. The shell and mantle together form a slightly curved tube which is open at both ends.

Class GASTROPODA. Snails and slugs. Members of this class occur on land, in fresh water, and in all seas.

1. Order PROSOBRANCHIA. Nearly all members of this order are operculate. They exist on land, in fresh water, and in all seas. Most of the marine snails belong to this order.

2. Order OPISTHOBANCHIA. These are nonoperculate snails, usually without a shell or with the shell greatly reduced. All are marine.

3. Order PULMONATA. Members of this order are nonoperculate, and breathe air by means of a pulmonary sac. They constitute most of the land snails and many of the fresh-water groups.

Class PELECYPODA. Bivalves. Members of this class occur in fresh water and in all oceans.

1. Order TAXODONTA. The most primitive of the bivalves, containing a series of similar teeth and sockets in each valve.

2. Order ANISOMYARIA. In this order the anterior adductor muscle is much reduced or wanting; the posterior adductor muscle is enlarged, and is developed near the center of the shell.

3. Order EULAMELLIBRANCHIA. Most of the bivalves belong to this important order. Both adductor muscles are present and generally about the same size. The hinge plate contains but few teeth, and these may be massive or almost lacking, depending upon the group.

Class CEPHALOPODA. Squids and octopus. All members of this class are marine.

1. Order DIBRANCHIA. This is by far the larger order, containing the squids, octopus, cuttlefish, and ARGONAUTA.

2. Order TETRABRANCHIA. This order contains only *Nautilus* as a recent genus.

See also AMMONITES; CEPHALOPODA; CLAM; NAUTILOIDEA; OYSTERS; SHELL.

WILLIAM J. CLENCH,

Curator of Mollusks, Museum of Comparative Zoology, Harvard University.

MOLLWITZ, mól'vits (Pol. MALUJOWICE), village, Poland, in Opole Province, Lower Silesia, 5 miles west of Brzeg (Brieg). Mollwitz was the scene of a famous battle (April 10, 1741) during the War of the Austrian Succession (see SUCCESSION WARS), in which Frederick II (the Great) had his first command. Frederick's cavalry was put to flight by the Austrian infantry, but Field Marshal Kurt Christoph von Schwerin finally defeated the Austrians under Field Marshal Wilhelm Reinhard von Neipperg in the battle.

MOLLY MAGUIRES, mól'í má-gwírz', an Irish secret society formed in 1843 at Farney, County Monaghan, to intimidate bailiffs or process servers distraining for rent or impounding the cattle of tenants who were unable or unwilling to pay. In the anthracite coal-mining region of Pennsylvania in the 1850's, an inner group of the Ancient Order of Hibernians set up a similar society called by the same name, which became active on a large scale about 1865. The members, disguised in "Molly Maguire" or women's dresses, sought to intimidate officials and others, and even resorted to murder. In 1874 the Pinkerton detectives were called in by the president of the Philadelphia Coal and Iron Company to cope with the situation, and one of the detectives, James McParlan, undertook to track the murderers. Posing as a criminal, he joined the organization and became secretary of his division. After the conviction of one murderer, McParlan was under suspicion by the group, and his life was in danger. When he withdrew, his evidence served to hang the murderers, and led to the disbanding of the society in 1877.

MOLLY PITCHER. See PITCHER, MOLLY.

MOLNAR, mól'när, Antal, Hungarian musician and critic: b. Budapest, Hungary, Jan. 7, 1890. His compositions include church music, of which *Missa brevis* won the Haynald Prize in 1910; choral works; works for orchestra, piano,

and organ; chamber music; and settings for songs. He played viola with various Hungarian quartets, and was teacher of composition, musical history and solfeggio at the Municipal School of Music in Budapest (1912-1918) and at the Academy of Music from 1919. From 1933 to 1940 he also edited *Népszerű Zenei Füzetek* (*Popular Musical Pamphlets*) to which many distinguished musicians contributed. When the Hungarian Association of Musicians was re-established in 1946, Molnár was elected deputy president. As a critic he did much to further the understanding of the work of Béla Bartók, Zoltán Kodály, and other modern composers.

MOLNAR, Ferenc (originally NEUMANN), Hungarian playwright and novelist: b. Budapest, Hungary, Jan. 12, 1878; d. New York, N. Y., April 1, 1952. He studied law in Budapest and Geneva, became a journalist on a Budapest newspaper, and soon began to publish fiction, notably the novel *A Pál-utcai fiúk* (1907; Eng. tr., *The Paul Street Boys*, 1927). With the production *Az ördög* (1907; Eng. tr., *The Devil*, 1908), his reputation as a playwright was established; his comedies, at once sophisticated and sentimental, continued to charm international audiences for a generation. *Liliom*, the most genuine of his plays, was presented in Budapest in 1909, and later scored a great success in the United States (1921, when Eva Le Gallienne and Joseph Schildkraut took the leading parts. It was followed by *A testor* (1910; Eng. tr., *The Guardsman*), in the New York production (1924) of which Alfred Lunt and Lynn Fontanne acted together for the first time.

During the first two years of World War I Molnár served as a war correspondent with Austro-German forces on the Russian front, and wrote an account of his experiences, *Hadtudó stílo naplója* (*A War Correspondent's Diary*, 1916). American productions of his postwar plays included *The Play's the Thing* (1927), in which Lunt and Fontanne also appeared; *The Swan* (1929); and *The Good Fairy* (1932). In 1940 he took up permanent residence in New York City, publishing his first novel with an American setting, *Farewell My Heart*, in 1945. The musical comedy *Carousel* was adapted from *Liliom* in the latter year, and *Make a Wish* from *The Good Fairy* in 1951. *Companion in Exile*, an autobiographical volume, appeared in 1950.

MOLOCH, mól'lok, or **MOLECH**, mól'lek, a pagan fire god called in the Old Testament an idol of the Ammonites, identified with the god of the Canaanites, who introduced his worship into Judah and Israel. His image was of bronze or iron, with a hollow human body, the head of a calf, and extended arms. A fire was heated in the lower part, and children were placed as sacrificial offerings in the arms, while the people danced to flutes and timbrels. Some authorities maintain that the children of the Israelites were not burned alive but sacrificed, and their bodies burned. The valley of Hinnom, or Tophet, near Jerusalem, where sacrifices of children took place, was later called Gehenna, a place of abomination.

In Leviticus 20:2-5, the Lord warns Moses against those who give their seed to Molech, and in I Kings 11:7-13, He rebukes Solomon for building a temple to Molech. Amos, Jeremiah, and Ezekiel all condemn Molech worship. In the New Testament the people are reminded (Act

7:43) of the days when their ancestors sacrificed to Moloch.

MOLOCH, a small Australian desert lizard (*Moloch horridus*) of the family Agamidae. Its skin is covered with irregular plates bearing thorny pointed tubercles, spines, and prickles, which are especially well developed behind the head.

MOLODECHNO, mŭ-lŭ-dyĕch'nŭ, oblast, USSR, in the Belorussian SSR. Its area is about 5,700 square miles. A region fought over in World War I, and afterward assigned to Poland, the oblast was formed from two Polish provinces in 1939, when the eastern portion of the country was taken by the Soviet. Until 1944 it was called Vileika Oblast. The region has many lakes and swamps drained by the Viliya River, and is well supplied with fish. In the north, flax and dairy farming are major industries; in the south, cereals and fruit are grown. Timber is plentiful, and quarrying is important. Pop. (1947 est.) 580,000.

MOLODECHNO (Pol. MOŁODECZNO), city, USSR, capital of Molodechno Oblast, in the Belorussian SSR, 40 miles northwest of Minsk on the Minsk-Vilnyus Railroad, of which it is a junction. Its chief products are musical instruments, flour, and meat. Ceded by Poland to Russia in 1793, it was returned to Poland after World War I (1921) and transferred formally to the USSR at the close of World War II (1945). Pop. (1931) 5,964.

MOLOGA, mŭ-lŭ-gá, river, USSR, in the Russian Soviet Federated Socialist Republic, rising west of Bezhetsk and flowing into the Rybinsk Reservoir in Yaroslavl Oblast. Its length is about 200 miles. Before the formation of the reservoir (1941), the river joined the Volga near Rybinsk. The former city of Mologa was included in the area of about 2,000 square miles covered by the reservoir.

MOLOKAI, mŭ-lŭ-kā'ĕ, island, Hawaii, located in the center of the island group. About 37 miles long and 7 to 10 miles wide, the island is mountainous, Kamakou (4,958 feet) being the highest peak. A special organization called the County of Kalawao administers the affairs of the celebrated leper colony, Kalaupapa, founded in 1860 and now a government settlement; it is shut off from the rest of the island, in the north central part. Father Joseph Damien de Veuster (q.v.) spent his noble life of self-sacrifice with the colony. The islanders produce pineapple and breed cattle. Pop. (1954) 4,878.

MOLOPO, mŭ-lŭ-pŏ, river, South Africa, in Cape Province and Bechuanaland Protectorate, rising east of Mafeking and flowing in a winding westerly direction to form a border between the two territories, and then into the Orange River west of Upington. Its course is about 600 miles long. It once drained the Kalahari Desert, now completely dry, and stretches of it are dry beds affording good pasturage, with water below the surface.

MOLOTOV, mŭ'lŭ-tŏf, Vyacheslav Mikhailovich (original surname SKRYAB'N), Russian statesman: b. Kukarka, Vyatka Province, Russia (now Sovetsk, Kirov Oblast, USSR), March 9,

1890. One of the leading figures in the Soviet Union from the early days of the Communist regime, Molotov began his political activity as a student in Kazan during the revolution of 1905, and joined the Bolshevik Party in 1906. Three years later he was arrested and exiled to the north of Russia for a two-year term; on being released, he went to St. Petersburg (now Leningrad), where in 1912 he joined Joseph Stalin in founding the party newspaper *Pravda*. When the 1917 revolution began, Molotov became a member of the Executive Committee of the Petrograd Soviet, and of the Military Revolutionary Committee which organized the Bolshevik seizure of power in November.

After the revolution, he rose rapidly in party ranks: in 1921 he became a candidate member of the Politburo and in 1926 a full member. Then, in 1930, he was named chairman of the Council of People's Commissars, an office equivalent to that of premier. He held this position all through the difficult period of the collectivization of agriculture, the Trotskyite-Bukharinite trials, and the rising menace of war, until the spring of 1941, when Stalin replaced him. Meanwhile, Molotov had also assumed the portfolio of foreign commissar (minister), succeeding Maxim M. Litvinov in 1939. In this capacity he negotiated the non-aggression pact with Germany in August 1939 and later, after the Nazi invasion of the USSR, attended the Allied conferences at Teheran, Yalta, and Potsdam, and the San Francisco Conference which organized the United Nations.

Molotov was succeeded as foreign minister by Andrei Y. Vyshinsky in 1949, but he retained the post of deputy prime minister under Stalin, and after the latter's death in 1953, became foreign minister once more. He represented the USSR at the Berlin Conference of Big Four foreign ministers early in 1954 and at the Geneva Conference on Far Eastern questions later the same year. He also was a member of the Soviet delegation at the Geneva Conference of Big Four heads of state in 1955. See also PACTS AND CONFERENCES: WORLD WAR II.

MOLOTOV, oblast, USSR, in the eastern European part of the Federated Socialist Republic. About 65,900 square miles in area, it lies in the Kama River valley on the western slopes of the Ural Mountains. Formed in 1938 out of the western portion of Sverdlovsk Oblast, it was called Perm until 1940, and then renamed for the Russian statesman Vyacheslav M. Molotov (q.v.). Two railroads serve it, and new cities have grown up as coal-mining centers since World War II. It is the largest mining region of the USSR, containing potash, salts, some petroleum, magnesium, coal, chromite, gold, iron, and many other minerals. In the southern part cereals and flax are grown and livestock raised. The forests supply building materials, and the many navigable rivers transport paper, pulpwood, and charcoal. The Komi-Permyak National Okrug, an ethnic subdivision of the oblast, is located in the northwest. Pop. (1946 est.) 2,250,000.

MOLOTOV, city, USSR, capital of Molotov Oblast, on the left bank of the Kama River, 700 miles northeast of Moscow. Until 1940 it was known as Perm. Its waterfront extends for 15 miles, and it is a major transportation center, with railroad repair shops and an airport. Other important cities in the area are Berezniki, Solikamsk,

and Kungur. The city of Molotov has good educational facilities, among them a large university and museums. Copper is smelted in Molotov, and other of the city's industries include the manufacture of machinery, matches, leather goods, and lumber. The region was occupied by the Russians in 1472, and the name Perm was given in the 17th century to a Russian settlement which had been established in 1586 at the village of Egoshikha. In 1939 the city of Molotov had a population of 255,196.

MOLTING, the change of skin, or of such cutaneous or partially cutaneous appendages as hair or feathers, which occurs annually or periodically in animals of many sorts, such as arthropods, birds, reptiles, and amphibians. It is a process often perilous to the animal, being not infrequently attended by loss of life. In mammals it may be gradual, as when the pelage or hair is changed. Examples of analogous processes are the annual shedding of the antlers of deer in spring, or the autumnal dropping of the horns of the pronghorn antelope.

Molting in Amphibia and Reptiles.—Here the entire skin is cast. The newt in early spring sheds its skin by detaching it from around the jaws, then pulling it back over the head and the limbs. The toad in molting causes the old skin to split along the back; it then pulls it off as one would a coat by working the muscles of the back; it is detached by movements of the head from around the lips, face, eyes, and mouth; the skin is more readily pulled off from the legs to the tips of the toes. The skin, as in salamanders, is a thin film, and it comes off in four pieces. Immediately after molting the creature is shy and active. Dallas Lore Sharp (q.v.) described the molting of the common striped snake (*Eutaenia sirtalis*). One came out of the water in a vivarium, gliding on to the grassy sod; it then shrugged itself for a moment, when the skin parted at the jaws. The skin on the head, however, remained fixed, so that when the creature crawled out the old skin was inside out. The operation took less than one minute. The rattle of the rattlesnake (q.v.) consists of those parts of the successive molts which are retained by a long knob made by the coalescence of the last few caudal vertebrae.

Molting in Birds.—The feathers may all be cast or only a part of them. Young birds molt several times before adult age. The passerine birds undergo a complete ecdysis after the breeding season is over (postnuptial), when the worn-out plumage is restored; and they may also before the breeding time pass through an incomplete molt, when their wedding dress is put on. The process is so gradual as a rule that few birds, except the ducks and certain others, are unable to fly, or go unprotected. The height of the molting season is in August, though the feathers drop out in nearly every month of the year. The complete molt is undergone in from a month to six weeks' time. Besides their feathers the pelican sheds a horny projection on the ridge of the bill, and the puffin and certain allied species shed the horny sheath of the bill. For further information see PLUMAGE.

Molting in Arthropods.—In most arthropods the various developmental stages become indicated in the external appearance of the animal by means of the successive molts, for no modification of form is possible without the re-

moval of the rigid exoskeleton. The Arachnid *Limulus*, the common horsefoot crab (q.v.), frequently sheds, its skin opening around the edge of the head; this is also the case with the freshwater crustacean *Apus*. In the crayfish and lobster the skin splits open between the thorax and abdomen, and the animal draws itself out of the transverse rent thus formed. The skin is cast entire, while the chitinous lining of the mouth, throat, fore stomach and of the rectum is also shed. The process of exuviation in the crayfish has long been known to be aided by the outgrowth of little delicate papillae called casting hairs; these serve to loosen the old integument.

In insects molting is frequent, especially in the larva stage, most caterpillars molting four or five times. The body moves convulsively and splits along the back, at the same time, casting hairs being usually absent, a molting fluid is poured out which serves to detach the old skin. The head is molted separately, the shell falling off by itself, then the body skin is shuffled off, being pulled back toward the tail, and with the outer integuments all the lining of the digestive canal is shed (except that of the stomach and beginning of the intestine), and the lining of the spiracles, as well as the cuticle of all the hairs, and the spines.

MOLTKE, Helmuth Karl Bernhard, hël'moot kârl bërnhârt mōlt'kē, COUNT VON, German soldier: b. Parchim, Mecklenburg-Schwerin, Oct. 26, 1800; d. Berlin, April 24, 1891. In 1805 his father removed to Lubeck, where young Moltke shortly afterward saw his home looted and burned during the French invasion and his family reduced to poverty. In 1812 he was admitted as a cadet of the Royal Military Academy, Copenhagen. In 1818 he was appointed one of the pages of the king of Denmark and passed his examination for a commission as first of the candidates. Seeing little prospect of advancement, he entered the Prussian service in 1822, becoming 2d lieutenant. He then studied three years at the staff college, Berlin; in 1832 was appointed to the general staff; in 1833 became lieutenant, and in 1835 captain. He had already visited Italy, and he now went to Turkey, where he became military adviser of the sultan Mahmud. He took part in the Turkish expedition against Ibrahim Pasha in 1839, but his advice was disregarded, and he returned to Constantinople, and on Mahmud's death to Berlin, where he was again employed on the general staff. His experiences in Turkey led him to publish two valuable works *The Russo-Turkish Campaign of 1828-29 in European Turkey* (1835), and *Letters on Affairs in Turkey in the Years 1835-39* (1841). After rising through the various army grades he was placed permanently at the head of the general staff of the army in 1859 with the rank of lieutenant general. His labors in reorganizing the Prussian army were of immense value to Prussia and to Germany, and had a great influence on the general history of Europe. The defeat of Denmark in 1864 was largely owing to his genius for military operations, and the result of the greater war of 1866 against Austria is equally to be attributed to him. Then followed the Franco-Prussian War of 1870, for which Moltke was entirely prepared, having foreseen for some years what was likely to happen, and having

immediately after the war against Austria prepared for a campaign against France. The success of the operations was in large measure a personal triumph for Moltke, and with the capitulation of Metz he was raised to the rank of count. Following his return to Berlin in 1871 he was created field marshal and appointed for life a member of the Prussian upper house. He continued as chief of the general staff till after the accession of Emperor William II in 1888, when he resigned.

MOLTKE, Helmuth von, German army officer: b. Gersdorf, Mecklenburg, May 23, 1848; d. June 18, 1916. A nephew of Count Helmuth Karl Bernhard von Moltke (q.v.), he received his army commission in 1870. He became quartermaster general in 1904, and in 1906 he was appointed chief of the general staff. With outbreak of World War I in 1914 he directed the strategy of the campaign on two fronts. The plan proved unsuccessful, and he was blamed for the German defeat at the First Battle of the Marne. On 3, 1914, he was relieved of his command and assigned to a post in Berlin.

MOLUCCA, mō-lūk'ā, SEA, an arm of the Pacific Ocean bounded on the west by the northeast coast of Celebes Island and on the east by the Moluccas, Indonesia; the southern limits are frequently considered to be the waters between the southeast Celebes and Boeroe Island. It is connected with the Pacific by the Molucca Passage, some 150 miles in width, between the northeast coast of the Celebes and the northern Moluccas.

MOLUCCAS, mō-lūk'āz, or SPICE ISLANDS, a group in Indonesia, east of the Celebes and west of New Guinea. Besides the three large islands of Halmahera (Djailolo), Ceram, and Boeroe (Buru), the Moluccas include several lesser groups, among them Soela (Sula), Batjan (Bachan), Obi (Obira), Kai (Ket), Aroe (Aru), Tanimbar (Timorlaot), Banda, Babar, and Leti (Letti). Smaller islands include Morotai and Wetar; and even smaller, though important, are Amboina (Ambon), Ternate, and Tidore. The Moluccas have an area of 32,298 square miles, and a population estimated to number 560,000. Nearly all of the islands are mountainous, some of them having peaks rising to 7,000 or 8,000 feet. There are several active volcanoes in the group, and earthquakes are of frequent occurrence. For the most part, the islands are covered with dense forest with luxuriant vegetation. There are deer and baboons, and some of the islands in the southwestern area of the group contain the large hog-babirusa. Among the birds are megapodes, which make mounds of vegetable debris in which to hatch their eggs, cassowaries (akin to emus), and birds-of-paradise. Nutmegs, mace, cloves, and other spices are exported, as well as products of the forest, sago, oil of the cajuput tree, and coconut palm products. The Moluccas were discovered in 1512 by the Portuguese, who acquired by purchase in 1528 earlier claims put forward by Spain. The Dutch succeeded the Portuguese on Amboina in 1605, and gradually they extended their influence over the entire group. The British were temporarily in control in 1796, and they effectively occupied the Moluccas from 1810 until 1814, when sovereignty

was restored to the Netherlands. With reorganization of the Netherlands East Indies as autonomous Indonesia after World War II, the Moluccas became part of one of the several federated republics of the United States of Indonesia. The unitary Republic of Indonesia which came into being in 1950 was opposed by an insurgent group on Amboina; they proclaimed the "Republic of the South Moluccas" in April, but organized resistance to the central government virtually ended in November, when troops of the unitary state captured Amboina. See also **INDONESIA**.

MOLY, mō'li, magic herb of the ancient Greeks that Homer says Hermes gave to Odysseus as a talisman against the enchantments of Circe. The plant is described as having milk-white flowers, and has been identified by different scientists under different herbs of the Liliaceae family, as the white water-lily, also as the garlics. *Allium magicum* L., or *Allium moly* L. were claimed by Italian Renaissance botanists, but these kinds have yellowish-red to red bloom instead of white, causing some to claim *Allium nigrum* L. or black hellebore, as more probable. See also **GARLIC**.

MOLYBDENITE, mō-līb'dē-nite, a native sulphide of molybdenum crystallizing in tabular or hexagonal forms. It commonly occurs in granite, gneiss, and other crystalline rocks, and is the principal source of the important metal molybdenum (q.v.). It is mined in various countries of the world, but far more extensively in the United States than elsewhere. Bohemia, Saxony, Great Britain, and Australia are leading producers of molybdenite. In the United States the chief centers of production are Colorado (principally), Arizona, Idaho, New Mexico, Utah, and Washington.

Molybdenite or molybdenum disulphide, MoS_2 , contains about 60 per cent molybdenum and 40 per cent sulphur. It is a soft, opaque mineral, with a lead-gray color, sometimes bluish or brownish, and with metallic luster. When crystallized it is found in tabular or short prismatic, hexagonal crystals. It has a perfect cleavage, and yields flakes which are flexible but not elastic. It is sectile and feels slightly greasy. Its hardness is 1 to 1.5, and its specific gravity is 4.7 to 4.8. Its streak is lead-gray metallic, bluish-gray on paper, and greenish on glazed porcelain. It occurs in fine granular or foliated masses or scales scattered through or imbedded in many crystalline rocks, including granite, gneiss, zircon syenite, and granular limestone. Its appearance is similar to that of graphite, for which it is frequently mistaken by the prospector. *Wulfenite* is a molybdate of lead, PbMoO_4 , and contains about 26.2 per cent molybdenum and 56.4 per cent lead. Its color is bright red to orange or wax-yellow; sometimes it is brown, grayish-white, or nearly colorless; occasionally it is yellowish-gray to pale green. Its luster is resinous to adamantine. When crystalline it is translucent, and occurs commonly in thin, square, tabular, tetragonal crystals. Sometimes octahedral and prismatic forms are found. It occurs also as crystal crusts and in massive granular forms. It is always found with other lead minerals, especially pyromorphite and vanadinite. It has one good pyramidal cleavage, and two less distinct ones. It is brittle and its fracture is subconchoidal in form.

Its hardness is 2.75 to 3, and its specific gravity is 6.7 to 7. Its streak is white. *Molybdate*, or molybdc ochre, is a hydrous ferric molybdate, $\text{Fe}_2\text{O}_3 \cdot 3\text{MoO}_3 \cdot 7\frac{1}{2}\text{H}_2\text{O}$, and contains 39.6 per cent molybdenum. It occurs as an earthy, yellow powder, or in hair-like crystals of pale yellow color, usually associated with molybdenite, of which it is an alteration product. Alone, it is not an important ore of molybdenum. It has a dull lustre, a straw yellow streak, a hardness of 1 to 2, and a specific gravity of 4.5. *Powellite* is calcium molybdate, CaMoO_4 , and contains 48 per cent molybdenum. Sometimes tungsten replaces part of the molybdenum. It is greenish-yellow to dull gray in color, subtransparent, resinous, without cleavage, has an uneven fracture, a hardness of 3.5, and a specific gravity of 4.52. *Ilsemanite* is an oxide of molybdenum, $\text{MoO}_3 \cdot 4\text{MoO}_3$, and contains about 68 per cent molybdenum. It is a blue-black to black cryptocrystalline mineral, associated with barite and wulfenite. It is soluble in water, giving a deep blue solution which on evaporation yields dark blue crystals. Rare. *Belonesite* is magnesium molybdate, MgMoO_4 , and contains 52 per cent molybdenum. It is a white transparent mineral, occurring in minute tetragonal crystals. It occurs in rock fragments enveloped in Vesuvian lava. Rare. *Pateraite* is cobalt molybdate, CoMoO_4 , and contains 43.8 per cent molybdenum, or it is molybdate of cobalt and iron, $\text{FeCoMo}_2\text{O}_8$, and contains 44.1 per cent molybdenum. It is an impure massive black mineral associated with uranium minerals. Rare. *Achrematite* is lead arsenate, chloride and molybdate, $3(\text{Pb}_3\text{As}_2\text{O}_8 \cdot \text{PbCl}_2) \cdot 4(\text{Pb}_2\text{MoO}_6)$, and contains 3.4 per cent molybdenum. It is a massive, cryptocrystalline mineral with an uneven to subconchoidal fracture, is brittle, has a hardness of 3 to 4, and a specific gravity of about 6. Its color is sulphur-yellow to orange and red, but in mass is liver-brown, owing to admixture of limonite. Its streak is pale cinnamon brown. Its lustre is resinous to adamantine, and fragments are translucent on thin edges. *Eosite* is a vanado-molybdate of lead, $\text{Pb}_2\text{V}_2\text{MoO}_{18}$, and contains 8.9 per cent molybdenum. Its color is deep Aurora-red. It has a brownish, orange-yellow streak. Its hardness is 3 to 4. It occurs in minute octahedral crystals of the tetragonal system which are found on pyromorphite and cerrusite. *Molybdurane* is molybdate of uranium, $\text{UO}_2 \cdot \text{UO}_2 \cdot 2\text{MoO}_3$. *Molybdoferite* is molybdate of iron, FeMoO_4 .

MOLYBDENUM, mō-līb'dē-nūm, a pure white metal, softer than steel, malleable and capable of being forged and welded. It can be filed and polished and may be drawn into ribbons and fine wire. Metallic molybdenum is used in various electrical contact making and breaking devices, in X-ray tubes, in voltage rectifiers, in the form of wire for filament supports in incandescent electric lamps, for winding electric resistance furnaces and in dentistry. It is also employed in the manufacture of chemical reagents, dyes, glazes and disinfectants. The principal use of molybdenum is in the manufacture of special alloy steels, usually in conjunction with chromium, manganese, nickel, cobalt, tungsten or vanadium. These steels are used for self-hardening and high-speed machine tools, for crank-shaft and pro-

PELLER-shaft forgings, high-pressure boiler plate, armor-piercing projectiles, permanent magnets, etc. The field of application is being constantly extended. About 92 per cent of the metal is produced in the United States—29,419,000 pounds in 1937 out of the world total of 32,000,000 pounds, of which 22,750,368 pounds came from Colorado. The purest molybdenum is produced from wulfenite, but practically the whole world's supply is obtained from molybdenite. Molybdenite resembles galena in some respects, and owes its name to this fact, the word "molybdenite" being based upon the Latin name for galena. It was first clearly distinguished from galena by Scheele in 1778, and in 1782 Hjelms obtained the element molybdenum in the metallic form. Molybdenum may be prepared by reducing the oxide by hydrogen, carbon or potassium cyanide, as well as by various other methods. It has a specific gravity of about 8.6 and a specific heat of about 0.0659. Its melting point is higher than that of platinum. Molybdenum is not affected by air or moisture at ordinary temperatures, but oxidizes slowly when heated in air, and at high temperatures it burns, whether heated in air or in steam. Chemically, molybdenum behaves both as a metal and as a non-metal. It has the chemical symbol Mo and an atomic weight of 96 if $\text{O} = 16$, or 95.3 if $\text{H} = 1$. It forms several oxides, of which the trioxide, MoO_3 , is the most important. This is the oxide that is formed when the metal is burned in air, and it may also be prepared by roasting the native sulphide in air. The trioxide occurs native in small quantities, as "molybdenum ochre," or "molybdate." Metallic molybdenum combines directly with chlorine to form MoCl_5 , and with bromine to form MoBr_5 ; but it does not combine directly with iodine. Unlike the other metals, molybdenum does not readily replace the hydrogen of acids to form definite salts, but its oxides dissolve in acids with the formation of compounds which have, as yet, been but little studied. The trioxide combines with water to form substances of the nature of acids, and which are, in fact, called "molybdic acids." These further combine with metallic bases to form an extensive series of compounds known as "molybdates." Ammonium molybdate is used in the laboratory as a reagent for the detection of phosphoric acid, a yellow precipitate being thrown down when a nitric acid solution of ammonium molybdate is added to a solution containing a phosphate. Consult Wolf, H. J., 'Molybdenum' (Golden, Colo., 1918); Wilson, A. W. G., 'Molybdenum' in 'The Mineral Industry during 1916,' Vol. XXV.

MOLYNEUX, mōl'ī-noo, William, Irish philosopher: b. Dublin, 17 April 1656; d. there, 11 Oct. 1698. He was graduated from Trinity College, Dublin, entered the Middle Temple, London, became a student of applied mathematics and philosophy, and a friend of Locke; was elected F. R. S. in 1685 and was elected to Parliament for Dublin University in 1692 and 1695. Besides his 'Dioptrica nova' (1692) on optics and philosophy, he wrote 'The Case of Ireland's Being Bound by Acts of Parliament in England' (1698), a work on the legislative independence of Ireland, which created a considerable sensation.

MOMBASA, mòm-bā'sā, East Africa, principal seaport of Kenya Colony, situated on an island of the same name 150 miles north of Zanzibar. The coralline island, three miles long by two miles wide, lies half a mile from the mainland, to which it is connected by a causeway and railway bridge. The town of Mombasa, two harbors, and several coconut plantations are included within the island's eight square miles. The old harbor, on the northeast of the island facing the town, can accommodate vessels drawing up to 30 feet and is used by dhows (native sailing craft) trading between the East African ports, Iran, India, and Madagascar. Kilindini (the deep place), the principal harbor, is at the southwest end of the island; the anchorage, which is landlocked, covers an extensive area, and modern deepwater wharves have made Kilindini the finest harbor on the east coast of Africa.

The native (Kiswahili) name for Mombasa is *Kisiwa Mvita*, meaning Isle of War, and many times in its long history it earned this appellation; the name Mombasa is that, also, of a port in the Arabian sultanate of Oman. Arabs were in possession of the East African island of Mombasa when Vasco da Gama (q.v.) visited it in 1498. During the 16th and early 17th centuries was held by the Portuguese, who built the great red Fort of Jesus, still extant, and made the town the capital of their vast East African domains; the sultan of Oman captured the fort in 1698 after a three years' siege, putting to death the 11 men and two women who survived. The Portuguese again occupied Mombasa during 1728-1729, only to lose it to the sultan of Muscat, and thereafter it remained for nearly 100 years in the hands of Arab rulers, the last of whom repudiated allegiance to Oman. The town was under British protection during 1824-1826, and thereafter it was part of the sultanate of Zanzibar. In 1887 it became headquarters of the Imperial British East Africa Company, which used part of the mainland possessions of Zanzibar (q.v.); and when, in 1895, the territories of the chartered company were taken over by the British government, Mombasa became the capital of the East Africa Protectorate. The capital was transferred to Nairobi in 1907.

MOMENT of a dynamical quantity is the importance of that quantity in regard to its dynamical effect relatively to a given point or axis. The moment of a force about a point is the product of its amount into its perpendicular distance from the point. The tendency of the action of such a force is to cause rotation about an axis perpendicular to the plane passing through the point and containing the force. Thus, in the case of a pendulum, the effectiveness of the force in causing rotation is measured by the moment Wl , where W is the weight of the pendulum, and l is the distance of the line of action of the force W from the center of rotation C , or the distance of the center of mass G from the vertical line through C . The term moment enters into several other phrases, all of which relate either directly or indirectly to rotation. Thus, there is the moment of momentum, or angular momentum, whose rate of change is the measure of the moment of the force producing the change. To obtain for any given body rotating with angular velocity ω about an axis, we first imagine the body broken up into a great many small por-

tions of masses m_1, m_2, m_3 , etc., at distances r_1, r_2, r_3 , etc., from the axis, multiply the momentum (mrv) of each mass by its distance, and then take the sum of all these products. The angular speed ω being the same in every expression, the moment of momentum takes the form $\omega (m_1 r_1^2 + m_2 r_2^2 + \dots)$, which it is usual to write in the symbolic form $\omega \Sigma mr^2$. The quantity Σmr^2 , which is the sum of the products of each mass into the square of its distance from the axis, is called the moment of inertia about that axis. It is the factor in the moment of momentum which depends upon the distribution of matter in the body. It enters into all questions of mechanics in which rotation is involved, from the spinning of a top or the action of an engine governor to the stability of a ship. By an obvious extension, the word moment is also used in such combinations as moment of a velocity and moment of an acceleration. Such phrases correspond to nothing truly dynamic, unless we regard velocity as meaning the momentum of unit mass and acceleration as the rate of change of that momentum.

If the mass of every small portion of matter in a body be multiplied by the square of its perpendicular distance from a straight line, the sum of all such products is called the moment of inertia of the body about the line regarded as an axis. The radius of gyration of the body is the distance from the axis at which all the matter of the body might be concentrated without altering the moment of inertia. Thus, if I is the moment of inertia of the body, M its whole mass and k its radius of gyration, $I = Mk^2$. We see that the moment of inertia of a body about a line is found by adding a great number of products of small masses and squares of distances; if the body can be defined mathematically as to shape, size and density, finding its moment of inertia is a problem of the integral calculus.

MOMENTUM, in mechanics and physics, the product of the mass and velocity of a body. Like velocity, momentum is usually regarded as having a definite direction, as well as a definite numerical magnitude. See **MECHANICS**.

MOMMSEN, mòm'zën, (Christian Matthias) Theodor, German classical scholar and historian: b. Garding, Schleswig, Nov. 30, 1817; d. Charlottenburg, Prussia, Nov. 1, 1903. He was the son of a pastor located at Garding and was educated at the University of Kiel, where he studied jurisprudence and philology and in 1842 was granted his Ph.D. With his brother, Tycho Mommsen (1819-1900), and his friend Theodor Storm (1817-1888) he published in 1843 a volume of verse which was scathingly condemned by the reviewers. His career as historian, however, began more successfully with publication of the treatise *De Collegiis et Sodalitatibus Romanorum* (1843), commended for its thoroughness and a clarity of style new to German works of the kind. From 1844 until 1847 he traveled through France and Italy, under commission of the Berlin Academy, collating manuscripts and inscriptions. Professor of Roman law at Leipzig (1848), he was dismissed as a liberal. He taught at Zürich (1852) and Breslau (1854), and from 1858 was professor of ancient history at Berlin. A Liberal member of the Prussian lower house (1873-1882), he bitterly attacked Bismarck's domestic policy. In an election

speech at Charlottenburg in 1882 he characterized the Iron Chancellor's tariff measures as a "Politik von Schwindel." Such boldness could not go unrebuked, and Mommsen was brought to trial for slander. His acquittal by both a lower and an appeals court was one of his great triumphs. He sternly advised the Teuton element in Austria in the struggle with the Czechs; made some caustic observations in a *North American Review* article on British treatment of minor nations; to the last was quite as belligerent as ever.

But he was only incidentally the politician. He has been called "the greatest scholar of our times, well nigh the greatest scholar of all times." He was distinguished as an epigraphist, historian, jurist, numismatist and philologist. None in the 19th century, which he almost spanned, has, as Freeman goes on to say, "taken in so wide a range of subjects, all brought with the happiest effect to bear upon and to support one another." To the educated reader at large he will probably continue to be best known for his *Römische Geschichte* (3 vols., 1854-56; 8th ed., 1889), to the battle of Thapsus; together with Vol. V on the provinces from Caesar to Diocletian (1885). Volume IV, on Imperial Rome, was unfinished at his death. There are English renderings by W. P. Dickson (Vols. I-III 1862-66; Vol. V 1886). This work opened a new epoch in historiography. Though written with great spontaneity, without even references to original sources, it was based on unrivaled knowledge, and presented its material with extraordinary clearness and at times with brilliancy. It is of course somewhat dogmatic, is certainly unfair to Cicero, and has been blamed, by Freeman among several, for undue glorification of mere power and success. To scholars Mommsen is above all the editor of the great *Corpus Inscriptionum Latinarum* (1863 et seq.; Vols. I, III, VIII, IX, by himself; others under his immediate supervision). Every inscription of this monumental collection was taken down from the original. The errors and falsities of predecessors were cleared away, and a scientific foundation was supplied for the study of Roman antiquities. Mommsen's preface to the series is said to be thought by critics one of the finest specimens of Latin prose written in modern times. For a complete list of his writings, Zangemeister's *Mommsen als Schriftsteller* (Heidelberg 1887; new edition by Jacobs, with additions, 1905) should be consulted. Mention may be made of *Römisches Münzwesen* (1860), *Römische Chronologie* (1859) and *Römisches Staatsrecht* (1899). All are standard, but the last, particularly, by the breadth and completeness of his exposition of the Roman constitution, places Mommsen among the foremost of constitutional writers. He also edited the *Res Gestae Divi Augusti ex Monumentis Ancyranis et Apolliniensi* (1865; new ed. 1883); the *Digesta* in Vol. I of the *Corpus Juris Civilis* (6th ed., 1893), and many other publications. His library, when partially burned in 1880, was replenished by gifts from foreign scholars. In 1902 he was awarded the Nobel prize in literature.

Bibliography.—Hirschfeld, O. *Gedächtnisrede auf Theodor Mommsen* (1904); Sandys, J. E., *History of Classical Scholarship* (Cambridge 1908); Wachsmuth, C. *Worte zum Gedächtniss an Theodor Mommsen* (Leipzig 1904).

MOMORDICA, a genus of plants of the gourd family, remarkable for their strangely marked seeds. Two or three species are cultivated in the United States as ornamental plants, one of which (*M. charantia*) produces a food for the Chinese in the pulp about the sculptured seeds; another Oriental food, the golkokra of India, is the fruit of *M. cochinchinensis*; and the balsam-apple (*M. balsamina*).

MOMOTOMBO, mō-mō-tōm'bō, Nicaragua, an active volcano rising 4,128 feet from the northwestern shore of Lake Managua. Eruptions took place in 1852, 1902 and 1905. The nearby village of Momotombo is connected by rail with Chinandega.

MOMPOS, mōm-pōs', Colombia, a town of the department of Magdalena on an island formed by the Rio Magdalena about 180 miles south of the deltaic mouth. The streets, which extend

parallel to the river, are well laid out, but the houses are badly built. Mompos is a depot of foreign goods, but the changes in the river's course rendering it unnavigable have seriously injured its prosperity. Pop. (1939) 6,694.

MOMUS, in Greek mythology, the god of satire and mirth. He is generally represented raising a mask from his face and holding a small figure in his hand. His mother was Nyx, the goddess of night. As a mocking censor and carping critic Jupiter cast him out of heaven.

MONA, mō'nā, (1) a West Indian islet belonging to the United States since 1898. It lies 42 miles east of Puerto Rico, in the middle of Mona Passage, to which it gives its name; seven miles long by two miles broad, its area is nearly 10,000 acres. It is of coral formation with a general level about 60 feet above the sea. A range of hills on the east side of the island runs from north to south, the highest peak of which is 175 feet above the water. Vegetation is luxuriant and all kinds of tropical fruits grow in profusion. It is the nesting place for green turtles, and the surrounding waters teem with the finest varieties of fish. There are no inhabitants beyond lighthouse keepers and guards. (2) the ancient name mentioned by Tacitus for the island of Anglesey (q.v.), Wales, also applied by other ancient writers to the Isle of Man.

MONA, a West African monkey (*Cercopithecus mona*), remarkable for its brilliant coloration, the head being olive-yellow, with a black stripe on the forehead; yellowish whiskers a purple face. The back is chestnut-brown; the undersurface is white and there is a white spot on each side near the root of the tail, which is black. It is constantly seen in menageries.

MONA LISA (MONNA LISA), a portrait of Lisa Gherardini, third wife of Francesco del Giocondo, painted by Leonardo da Vinci (q.v.) possibly between 1500 and 1504, although some critics date it between 1503 and 1506.¹ The painting, also known as *La Gioconda* (Fr. *La Joconde*), is a half length, life-size portrait on a canvas 30" x 20". Francis I is said to have bought it a few years after completion for 4,000 scudi, an equivalent of about £1,800 (\$8,000). It remained at Fontainebleau until it was removed to Versailles by Louis XIV, probably after 1694, and it was not exhibited at the Louvre, where it now hangs, until after the French Revolution. It disappeared on the morning of Aug. 21, 1911, when Vincenzo Peruggia, an Italian painter who was frequently employed at the Louvre, removed the canvas and kept it in a closet of his room. On Dec. 12, 1913, he took it to an art dealer in Florence who notified the police. After a short exhibition at the Uffizi Gallery, it was returned to the Louvre, unchanged. During World War I

¹ Almost all the details of this picture have been disputed. Although Lisa Gherardini has been traditionally accepted as the sitter, Adolfo Venturi, the Italian art critic, in the *Enciclopedia Italiana*, believes that she was Costanza d'Avolas; others maintain that it is not a portrait at all. Few dates in da Vinci's life are certain, and the dates of his paintings are often estimated from the development of his style in coordination with scanty biographical data. Giorgio Vasari, an Italian art historian who wrote within a few years of da Vinci's death, states that the picture was in process for four years.

nd II it was put in storage for safekeeping, and as again returned to the center gallery in October 1947. The portrait has not been well preserved.

The picture aroused little attention for some three hundred years, but criticism awoke in the romantic period, for this painting appealed to the sensuous rather than the rational nature. Walter Pater, in contrast to the appreciation of the artist's technique, expressed his criticism in his essay *The Renaissance*: "From childhood we see this image defining itself on the fabric of his dreams; and but for the express historical testimony, we might fancy that this was but his ideal lady, embodied and beheld at last . . . It is a duty wrought out from within upon the flesh, the deposit, cell by cell, of strange thoughts and fantastic varieties and exquisite passions. . . . She is older than the rocks among which she sits; like the vampire, she has been dead many times, and learned the secrets of the grave. . . . Much has been written about Mona Lisa's smile, but many critics find nothing unusual about it. Pater notes that "the unfathomable smile, always with a touch of something sinister in it" was a technique of Leonardo da Vinci's master, Verrocchio, and had been copied many times.

There are two *Mona Lisa's* attributed by experts to Leonardo da Vinci, neither of which is a copy of the other. Since no original sketch exists for *Mona Lisa*, it is not thought improbable that da Vinci first painted one portrait directly on canvas before working on the final copy. The Isleworth version, in England, is admitted by many to be more beautiful than the Louvre painting.

It is thought to be the final, unfinished portrait since it is much richer in shading and detail, and is probably the one from which Raphael made his famous sketch. See also PAINTINGS OF THE GREAT MASTERS.

MONACO, mōn-ă'kō, the smallest sovereign principality in Europe with an area of 395 acres (1 square miles). Bordering on the Mediterranean coast, it lies nine miles east of Nice and is surrounded on the north by the French department of Alpes Maritimes. The principality includes three districts: Monaco Ville (pop. 1950, 860), La Condamine (pop. 1950, 9,858) and Monte Carlo (pop. 1950, 8,484). There is only one municipal government for the three districts; it has its seat in Monaco Ville. Some coins minted by Monaco but the language and most of the currency are French.

From the 10th to the 5th century B.C., Monaco belonged to the Phoenicians, who were replaced by the Phocéans in the 4th century B.C. During the early Christian era it was dominated by Rome until the barbarians and Saracens erected a fort on the rock about the 9th century. Emperor Otto I conferred Monaco on a Genoese prince of the house of Grimaldi in the 10th century. The first prince of Monaco was Rainier I who ascended the throne in 1304. In 1731 the male line became extinct with Antoine I, and his daughter Louise Hippolyte succeeded to the throne. She was followed by her husband, Jacques de Goyon-Matignon, count of Thorigny, who took the name Grimaldi. In 1792 the line was deposed during the French Revolution but re-established in 1814 under the protection of the French with Honoré I on the throne. He was

succeeded by Honoré II (1819-1841), Florestan I (1841-1856), Charles III (1856-1889), and Albert I (1889-1922). Louis II (1870-1949) was prince of Monaco until 1949. Rainier III (b. May 31, 1923), son of Princess Charlotte Louise Juliette, daughter of Louis II, ascended the throne in 1949 and is the current ruler.

In 1815 by the Treaty of Vienna, Monaco was placed under the protection of Sardinia, but in 1848 Menton and Roquebrune revolted and became independent until 1861 when they were attached to France. The country remained an absolute monarchy until 1911 when a constitution provided for a National Council of 12 members elected by male suffrage for a term of four years. Executive power rests in a ministry assisted by a Council of Government.

Tourist trade is of chief importance. The gambling establishment at Monte Carlo furnishes less than 3 per cent of the revenue. Among the places of interest are the Cathedral of St. Nicholas and its art treasures, the famous Oceanographic Museum built by Albert I, the Palace of the Prince, the Exotic Gardens, and the gardens of St. Martin. Perfumes and cosmetics are exported and local industries include the manufacture of electrical appliances and radios, pharmaceuticals, and printing establishments. Pop. (1950) 20,202.

MONAD, mōn'ăd, in *philosophy*, is derived from the modified pluralism of Gottfried Wilhelm von Leibnitz (q.v.) and is used to refer to individual units which constitute reality. Each monad is in itself a small universe and has an infinite possibility for development. No two are alike but each works in harmony with the other.

In *biology*, a term for the simplest organism or organic unit; in *zoology*, a primitive organism, a flagellate protozoan such as the Mastigophora.

In *chemistry*, a monovalent element, radical, or atom, such as H, OH, CH₃, or NH₄.

MONADNOCK, mō-năd'nōk, New Hampshire, an isolated mountain of a typical erosion character, near the southwest corner of the state, in Cheshire County, 10 miles southeast of Keene, area five miles by three, altitude 3,186 feet above sea level.

MONAGAS, mō-nă'gās, José Tadeo, Venezuelan soldier: b. Maturin, Venezuela, Oct. 28, 1784; d. El Valle, Venezuela, Nov. 18, 1868. He served in the War of 1812-1821 under Bolívar. In 1835 he supported a revolution but made his peace with the government a few months later and in 1847 was elected president. His administration was at first marked by liberal measures, but his policy becoming arbitrary he was deserted by his party, whereupon he abolished Congress and assumed a dictatorship. In 1846 he defeated Páez who led a revolutionary movement, imprisoned him, and in 1851 took command of the army, the presidency being held by his brother, José Gregorio (1851-1855). In 1855 he was reelected, but a revolution followed and he was compelled to leave the country in 1858. He returned in 1864 and in 1868 headed a successful revolution and was elected president by Congress, but died before being installed in the office.

MONAL. See IMPEYAN PHEASANTS.

MONARCHIANISM, a doctrine of the second or third century stressing the unity or

oneness of God in opposition to the orthodox doctrine of the Trinity (q.v.). There are two types: the Dynamic Monarchians believed that Christ was a mere man who became the Son of God by adoption (q.v.); Monarchical Modalism taught that the Trinity was but three modes of God's manifestation. Praxeas (q.v.) and Sabellius (q.v.) were its adherents. The dynamistic type is represented by Theodotus of Byzantium, Paul of Samosata (q.v.) and Zenobia, queen of Palmyra.

MONARCHY (Fr. *monarchie*, from Lat. *monarchia*, from Greek *μοναρχία*, rule of one, sole power). In the course of history, the word monarchy has been subjected to so many interpretations and has been applied to so many different kinds of governments that an exact definition or a classification of its main divisions is difficult. Strictly speaking, the word means undivided sovereignty or rule of a single person, and hence it has been used to describe states in which the sovereign or supreme authority is vested in a single individual, the monarch, who in his own right is the permanent head of the state. The king or chief magistrate of a state may properly be termed a monarch only when he possesses the entire ruling power, but the term monarchy has outlived this original meaning and in popular language is used somewhat loosely to designate that form of government in which the chief authority is exercised by a hereditary sovereign as distinguished from republics with elected presidents, or for the "monarchical principle" as opposed to the republican. Still more loosely the term is used to designate any government in which the political head is called king or prince, regardless of the authority he may exercise or the manner in which political power is distributed. The changes in the power exercised by the monarchs of Europe have necessitated the invention of new terms for general use in describing the various forms of government, but these terms in themselves are a contradiction of the true meaning of monarchy. We now have "limited" or "constitutional monarchy" as opposed to "absolute" or "autocratic monarchy," and a distinction is also made between "hereditary" and "elective monarchy," though the distinction is unimportant since these terms do not indicate the nature of the government.

As stated above, the absolute monarchy is the only real monarchy in the strictest interpretation of the word, since it is the only government in which the ruler is absolutely supreme. (See ABSOLUTISM). A mixed or limited monarchy is one in which the ruler, though still possessing the status and dignity of royalty, shares the supreme governmental powers either with a body of nobles, or with a popular representative body, or with both. A constitutional monarchy is one in which the power of the ruler is restrained by a constitution. Woolsey says: "Mixed monarchies are something more than limited ones. There may be a limited monarchy where king and people, the former restricted by a constitution, the latter organized and invested with certain means of preventing illegal government, are the only forces. This may be called mixed, perhaps, yet the term rather inclines to embrace only such states as have three or more political powers, as king, nobles and people, united in the government, or

the same powers with the clergy, as in many mediæval states. Thus all mixture contains limitations but all limited governments are not mixed." There are now no constitutional or limited monarchies wherein the sovereign possesses power to legislate by decree and in such a monarchy the democratic element is the only authority directly exercising any great amount of actual power. Monarchies are usually hereditary though they sometimes have been elective, but in the latter case they have generally been attended with disastrous feuds, and great confusion in the elections, as in Poland. Of the elective monarchies the most conspicuous were the papal states, the Pope being elected by the cardinals; but the states of the Netherlands were termed republics even though in some of them the office of stadtholder was hereditary. In Europe all monarchies were originally elective, within certain limits; and subsequent to the introduction of Christian kinship with the reigning family did not count so much as the essential condition of the assumption of sovereign power as the "sacring" by the divine authority of the Church. Constitutional monarchs in their origin may be elective or they may combine both systems, as when one family is disinherited and the supreme power under certain conditions declared hereditary in another. The purely hereditary principle is of comparatively late origin, the outcome of obvious convenience which became a religious or quasi-religious dogma. Absolute monarchies disappeared following the World War, the last survivors being Siam and Afghanistan; and the limited monarchies are Belgium, Great Britain, Denmark, Italy, Japan, The Netherlands, Norway, Persia, Rumania, Yugoslavia, Bulgaria and Sweden.

The conception of monarchy was derived through Christianity from the theocracy (q.v.) which was the earliest form of state and which was developed in Asia and northern Africa. The theocracy was ruled by a high priest or by a king or prince who represented within the limits of his dominions the monarchy of God over all things; hence religion was the bond of union and the idea culminated in the 17th century in the doctrine of divine right of kings. Therefore, when later transformed from divinely ruled state into one with a human king, the distinguishing mark was despotism. But this barbarous form of monarchy was rejected by the people of Aryan origin who gave some recognition to individual and class rights apart from the rights of kings and princes. Though at first the monarchies were absolute, yet the absolute monarchs were not always tyrannical but in many cases ruled for the good of their subjects. Among monarchs of this class were Henry IV, Saint Louis, Canute, Charles the Magnificent and others of the early centuries of European history and the "enlightened" or "benevolent" despots of the 18th century. The essential basis of the feudal monarchy (which followed the decline of Carolingian authority) was the bond of fealty between the king or supreme lord and his vassals, who derived from him their rank, power and property. The mediæval monarchy was followed by the modern absolute monarchy which first made its appearance in France, proclaiming the doctrine of divine right of kings and culminating in the absolutism of Louis XIV. The Stuarts

England held this doctrine but the monarchic principle was shaken by the execution of Charles I and the English Revolution of 1688 and was further damaged by the execution of Louis XVI in 1793. Since that time the surviving monarchies of western Europe have been transformed into constitutional or limited monarchies, the growth of democratic ideas having greatly reduced the former powers of the king or emperor. Monarchy remains a political issue in Spain and Italy; the role of the British sovereign, as symbol and as constitutional pivot of the commonwealth, transcends this monarch's very limited political powers. See also ABSOLUTISM; FEUDALISM; GOVERNMENT; KING; SOVEREIGN; STATE; THEOCRACY; and descriptions of governments of the various nations.

MONASTERY. See MONASTICISM.

MONASTERY, The, an historical romance by Sir Walter Scott, one of the later novels of his *Waverley* series, published in 1820. The scene is mid-16th century Scotland in the last days of Catholicism, and the story concerns the noble Mary Avenel and her suitors. A losing claimant on her hand becomes a monk and other monastic characters are shown; hence the title. An apparition or spirit, the "White Lady" or "White Spirit," works outright miracles. Perhaps because Scott failed to portray the miraculous convincingly, the book was not as successful as its sequel, *The Abbot*, published the same year, which introduced Mary Queen of Scots as a character.

MONASTIC ART AND ARCHITECTURE. So great was the role played by the several monastic orders in western Europe during the thousand years after the fall of the Roman Empire that the very preservation of civilization may be credited to them. Especially was this true during the Dark Ages and through the Romanesque period of the 11th and 12th centuries. Indeed in large measure medieval art, until the Gothic period at least, was indistinguishable from monastic art. For example, the Irish monasteries in the 8th and 9th centuries produced such manuscripts as the Lindisfarne Gospels and the Book of Kells with their peculiarly northern nearism, energy, and decorative quality, surely among the great artistic triumphs of the Dark Ages. The portals of the Cluniac churches of Vézelay and Moissac are outstanding examples of Romanesque sculpture. During the later Middle Ages, the monasteries played a less dominant role and, with the growth in importance of cities and of the royal power, secular craftsmen arose to supplant them.

Similarly in architecture, the monastic churches and buildings illustrate the successive changes of style neither more nor less than do non-monastic churches or secular buildings of the same time. The differences stem from two considerations. First, a monastic establishment comprised not only a church but dormitories, refectories, infirmaries, chapter houses for formal meetings of members, shops, and farm buildings of all

sorts. The 9th century plan of the Benedictine Monastery of St. Gall in Switzerland is an early example that demonstrates the self-sufficient nature of such institutions. The monks and lay brethren of the order worked the land, did their own tanning and blacksmithing, their own brewing and baking. According to the rules of the order, hospitality was provided for travelers; guest houses were therefore required. Thus it is clear that the architectural problem of a monastery was quite similar to that of a feudal manor house, save that it was even more complicated, and revolved around the monastic church as its all important center.

A second reason that sometimes distinguishes monastic from other churches is found in the particular liturgies required by the monks. Although not unique to the monastic orders, elaborate processions played an important role in their services. In 1132, a procession of 1,212 monks was held in the Abbey of St.-Pierre at Cluny. The widespread influence of the monastic orders may be indicated by the striking similarity of five great churches built on the routes leading to Compostela (Santiago de Compostela) in northwestern Spain, those churches were St. Martial, Limoges; St. Etienne, Nevers; St. Foy, Conques; St. Sernin, Toulouse; and St. James at Compostela. Moreover, several important features of medieval architecture were essential to monasteries but might be omitted or minimized in non-monastic churches. For example, the cloister provided a sheltered walk for the monks, and often also incorporated, as at Gloucester, niches (carrels) where individuals might study or write. Since more than half of the great English cathedrals were monastic in origin, mostly Benedictine, the cloister was almost universal there, but is less often found in the French Gothic cathedrals. The cloister was, however, common in churches governed by secular canons even though they were not members of an order. The origin of the English churches also explains their setting, surrounded by the lawns and trees of the monastic grounds instead of, like the French, crowded by the houses of the towns. A second feature of monastic churches was the necessity of stalls in the choir for the individual monks. The stalls were ranged in rows facing each other. The number of rows, two or three on each side of the aisle, determined the width of the choir, and the number of seats in each row, dictated by the size of the monastery, fixed its length. Where, as was often the case in the larger churches, the laity had rights to part of the church, a screen separated the nave from the choir and preserved the latter, including the sanctuary with the high altar, for the exclusive use of members of the order. Finally some few of the monastic orders had such specific needs that they required particular types of churches. Of these, the most important was the Cistercian, founded in 1098 as an offshoot from the Benedictine Order. The typical plan had a short rectangular sanctuary without aisles. This was entered directly from the transept, also without aisles, but with its eastern wall lined with chapels. Since the rules of this order compelled manual labor, the Cistercian monks were distinguished above all others as masons. The Knights Templars and the Knights Hospitallers expressed their mission by designing their churches in a circular form inspired by the Church of the Holy Sepulchre, Jerusalem.

EVERARD M. UPJOHN.

MONASTIC ORDERS, Costume of. See **COSTUME, ECCLESIASTICAL.**

MONASTICISM, or **MONACHISM**, is a state of life in retirement from the world adopted for motives of religion. It is not peculiar to Christianity, for in many religions, as that of Israel, and in those of India, China and Tibet, the same motive has led men to withdraw themselves wholly or in part from converse with worldly society and to seek in seclusion and retirement opportunity to lead a purer or higher life. The Nazarites, the Rechabites, the Essenes, the Therapeutæ were separatists from society in a greater or less degree, and in this respect were the precursors of the ascetæ of the earliest Christian age and of the hermits or anachoretæ and the cœnobites of the 3d and 4th centuries.

In the middle of the 3d century, during the persecution of the Christians by Decius, Paul of Thebes in Egypt (Saint Paul the first hermit), withdrew to a wilderness, and during the remainder of his long life lived in absolute solitude in a cavern of a mountain, deriving his food and his vesture from a neighboring grove of palm trees. Many others fleeing from persecution or from the contagion of a profoundly corrupt society, flocked to the wildernesses of the Nile country; among them was Antony (Saint Antony), who after many years of the strictly solitary life of an anchorite was in a manner compelled by circumstances to adopt the cœnobia rule. He was by choice an anchorite like Saint Paul the Hermit, but the fame of his virtues and his miracles brought to his cell in a remote wilderness many who desired to devote themselves to the service of God under such a master; and as he could not refuse their prayer he became, in fact if not in name, the Father or Abbot of a pretty numerous cœnobium; hence he is called the Father of Monachism, that is, of the life-in-common of those who retire from the world for reasons of religion; they retain the title of monk, *monachus* (a solitary), though since Saint Antony's day they are no longer solitary but cœnobites.

Antony's cœnobites occupied each a separate hut or a separate grotto; but Saint Pachomius, a contemporary of Antony, introduced a further development of the community life. The cells or huts were now to hold three brethren; meals were eaten in common; the labor of the monks was regulated; the brethren were graded according to their spiritual proficiency; the community was presided over by an abbot, with inferior officers; in addition to the primitive industries of petty agriculture, basket-making and mat-weaving, the monks practised the trade of the smith, of the tanner, etc.; there were daily assemblies of the community for prayer and conference. When Saint Pachomius died, about the middle of the 4th century, 7,000 monks were subject to his rule.

From Egypt monachism soon spread into Syria, Palestine, Mesopotamia, Asia Minor and Armenia.

The introduction of monachism in the Western countries of the Roman Empire dates from a little after the middle of the 4th century when a few small communities of monks, under the Pachomian rule, were founded at Rome and in Northern Italy. Later, when the rule of Saint Basil had been translated into Latin, communities of Basilian monks sprang up in Southern

Italy. Saints Jerome, Augustine and Ambrose were zealous promoters of monachism in Italy and Africa, Saint Martin of Tours in Gaul, when Saint Martin died (397) his body was followed to the tomb by 2,000 monks.

Whether under the Pachomian or the Basilian rule or under modifications of these, monastic establishments multiplied rapidly in the West. But the disorder which attended the decline of the Western Empire and the barbarian invasions, had its effects upon monachism, and the monastery exhibited the same anarchy as did civil society.

Early in the 6th century Benedict of Nursia, who had already led for three years the life of a strict recluse in a cave at Subiaco, about 40 miles distant from Rome, was chosen by the monks of a monastery in the same place as their abbot; but very soon, his new subjects having deposed him, he returned to his solitude and commenced that reform of Latin monachism which made his name illustrious. He gave to his monks a rule which, variously amended and modified, has been the law of the monastic life of Western Europe ever since. In its preamble Benedict recognizes two and only two legitimate classes of monks — cœnobites and anchorites — those who lead the life in common and those who live in solitude — usually now called hermits.

Two other classes he names, but only for condemnation, namely, *sarabaites* — professing monks who live two or three together without any superior or any fixed rule; and *gyrovagi* or *circulatores*, tramps, wandering beggars who wear the cloak of a religious profession. To do away with these scandals of the monastic life, Benedict's rule requires that the postulants for admission to a monastery shall take addition to the usual monastic vows of poverty, chastity and obedience, a further vow that he will remain all his days in the community which he makes his profession, and never absent from the monastery save by leave of his superior.

Besides monasteries for men Benedict instituted also monasteries for women, and the first abbess of a community of Benedictine nuns was his sister Scholastica.

The Benedictine order was for a long time a powerful agency in the civilization and christianization of the barbarian nations of Europe. Wherever a Benedictine foundation was made there the face of the country was quickly changed: forests were cleared, marshes drained, the arts of husbandry developed, peace and civil order maintained, science and learning fostered, schools, hospitals and refuges established.

Monastic institutions founded in Britain, France, Switzerland, Italy and Germany by Celtic monks prior to Benedict's reform conformed to the Benedictine rule. The Carthusian order founded in the end of the 11th century, was a reversion to the anachoretic type of monachism — the solitary or eremitical instead of the cœnobitic life. In the same century arose the order of the Camaldoli, another order of hermits.

The beginning of the 12th century saw the rise of that singular development of monachism, the knightly orders, the members of which besides the usual three vows of the monk took a fourth vow, of making war on the infidels in the defense of Christendom. The Knights Ho-

callers were originally a religious society and by vow to harbor in health and in dis- pilgrims visiting the holy places in Jerusalem; their house in the holy city was a "hospital" or guest-house. The full title of the knights Templar is "pauperes commilitones christi templique Salomonis"—poor knights-companions of Christ and of Solomon's temple. Another military order contemporary with these is the Teutonic order. History records the tales of over 90 military orders or of bodies clothing themselves so.

The chronic state of war between Christendom and the Mohammedan power led to the institution of the order of Trinitarians and that of Our Lady of Mercy. The mission of these orders was the redemption out of slavery among the Mohammedans of Christian captives. Bearing the alms and gifts contributed by the churches of Europe, the members of those orders visited the Mohammedan countries on the Mediterranean and procured the liberation of the enslaved Christian captives and restored them to their native countries. The Trinitarians had one time 250 houses; the Christians redeemed them, from first to last, numbered over 1,000. The order of Mercy was at first a military order, but in 1218 it put off its military character, and devoted itself wholly to the charitable work of redeeming the captives.

There seemed to be now a sufficiency of religious orders to satisfy all needs. But at this very time, the beginning of the 13th century, new orders were instituted—and that by Pope Innocent III. who in the Lateran Council procured the enactment of a decree forbidding the creation of new monastic orders. The new institutes were the order of the Friars Minor (Franciscans) and that of the Friars Preachers (Dominicans); and to these very soon were added two more—the order of Austin Friars (Augustinians) and that of the Carmelites. These are the four mendicant orders, so called because by their rule they renounce all property and all endowments and exist on the alms of the faithful.

The membership and the establishments of these mendicant orders increased with astonishing rapidity throughout the whole of Europe. Dominican and Franciscan friars were soon the great lights of the theological schools—Albertus Magnus, the Doctor Universalis, as he is styled by his contemporaries, and Thomas Aquinas, the Angelic Doctor, being the foremost of the Dominican divines, and Duns Scotus, the Doctor Subtilis, and Roger Bacon leading the first rank among the Franciscans. The friars were also effective missionaries both among the poor and the rural populations at home and among the heathen and the infidels.

The Company of Jesus is the latest of the great religious orders; it was founded in 1534 and its mission was to resist the onward march

of Protestantism, directly by combating the Protestant assault on the Catholic Church and indirectly by instructing the Catholic populations in the soundness of their religious faith and practice; directly by organizing a system of higher education for Catholic youth, and offering educational advantages superior to those afforded by Protestant universities and academies. The Company of Jesus took also as its special field of labor the evangelization of the heathen.

Nearly all the later religious orders and in-

stitutes have had for their object the Christian education of the young, the reformation of the fallen, or the relief of the poor and distressed; among the orders established for these ends are those of the Nuns of the Good Shepherd, the Sisters of Charity and of Mercy, the Brothers of the Christian Schools, and numerous other congregations.

The Reformation was hostile to monasticism, and in those countries where it obtained, the monasteries were suppressed and the monastic life disappeared. Henry VIII seized upon the monastic properties throughout his realm and applied them for his own religious or secular purposes. In Protestant Germany, Scandinavia and Switzerland, the monastic institution ceased to exist shortly after the triumph of the Reformation. In the 18th century a concertedly hostile movement against monasticism took shape in all the countries under Bourbon rule. The governments of Portugal, France, Spain, Sicily and some of the Italian principalities expelled the Jesuits and brought such political pressure to bear upon the Papacy that Clement XIV reluctantly signed the decree suppressing that famous Society in 1773. Pius VII restored the Society in 1814. During the latter half of the 19th century a recrudescence of hostility on the part of the governments of the Latin countries against the religious orders manifested itself. In Spain, France, Italy, Mexico and some of the South American republics expulsion for some orders and hampering restrictions upon freedom for others have contributed to retard their growth and development. The reasons usually alleged for these coercive measures by these governments are political and economic, the merits of which it would be out of place to discuss here. In the opening decade of the 20th century the French government aimed a deadly blow at monasticism in that country in its Associations Law. Germany admits all the religious orders except the Jesuits. In Great Britain full freedom is now given in the establishment and development of monastic institutions. In the United States, where there are absolutely no legislative restrictions upon the freedom of monastic life, the religious orders are in a flourishing condition. In this country there are 8,400 male and over 50,000 female members of religious orders.

In the Church of England within the last 50 years there has been a revival of the monastic idea with no inconsiderable results. Dr. John Mason Neale and Canon Carter promoted the establishment of sisterhoods (of Saint Margaret and of Saint John Baptist), in which life vows of poverty, chastity and obedience were taken, and a mother house of the Sisters of Saint John Baptist was founded in New York as a branch of the central house in England. There is also the Protestant Episcopal sisterhood of Saint Mary and many others in the United States. Among the male orders of Protestant monasticism must be mentioned the Cowley Fathers, founded by Dr. Benson, and in the United States the Order of the Holy Cross, a preaching order founded by J. O. Huntingdon, son of Bishop Huntingdon. An order of monks was also founded by Rev. Joseph Leycester Lyne in 1870 at Llanthony Abbey, Wales, and the strict rule of Saint Benedict was adopted. It is no exaggeration to say that the

monastic movement is now flourishing, both in the Church of England and in its daughter church, the Protestant Episcopal Church in the United States. For further details see the articles on the various orders, also ABBEY; AUGUSTINE, St.; BASIL, St.; BENEDICTINES; CISTERCIANS, etc.

C., *Christian Monasticism* (New York 1925); Ryan, J., *Irish Monasticism* (New York 1931); Moorman, J. R. H., *Church Life in England in the Thirteenth Century* (New York 1945).

MONASTIR, mōn-ās-tīr' (ancient RUSPINA), seaport town, North Africa, in northeastern Tunisia, on the Gulf of Hammamet. It is strongly fortified with surrounding walls surmounted by towers and has a castle, 13 mosques, a high school for the natives and beautiful gardens in the vicinity. Its chief industries are soap-making and the oil trade. Pop. (1946 est.) 11,000.

MONAZITE, mōn'-ā-zīt, a rare earth mineral, comprised essentially of an anhydrous phosphate of ceria, lanthana, neodymia, praseodymia (formula: Ce, La, Nd, Pr) PO₄, and usually thorium (ThO₂). It occurs in certain granitic and gneissic rocks but the most concentrated deposits are of an alluvial nature. It crystallizes in the monoclinic system, most of the crystals being the size of sand grains, though some as long as five inches occur in the Ural Mountains and Norway. The crystals, usually yellowish to reddish-brown, are about 5 to 5.5 in hardness, with a specific gravity of about 4.9 to 5.5. Monazite is found in many parts of the world, but the monazite sands of the seacoast of Brazil, India, Indonesia, and to some degree the South Mountain region of North Carolina, have provided the chief commercial supply. Monazite, which first came into commercial use about 1886 as a source of supply of thoria required for the manufacture of the Welsbach incandescent gas mantle, is used in the manufacture of radio and X-ray equipment, highly refractory crucibles, sun lamps, and sparking flints; also for stabilizing the arcs in carbon arc lamps, coloring topaz-yellow glass, mothproofing fabrics, opacifying enamels, etc.

MONBODDO, LORD (JAMES BURNETT). See BURNETT, JAMES.

MONCLOVA, mōng-klō'-vā, town, Mexico, in Coahuila State, 110 miles northwest of Saltillo. Monclova dates from the 17th century and was formerly the capital of the dual state of Coahuila and Texas. It has railroad works, copper, silver, zinc, and lead mines, coffee plantations, stock raising interests, and a trade in the agricultural produce of the region. Pop. (1940) 7,181.

MONCRIEFF, mōn-krēf', SIR Alexander, British ordnance expert, inventor of the disappearing gun system: b. Edinburgh, April 17, 1829; d. Pandirran, Aug. 3, 1906. He was educated at Edinburgh and Aberdeen; apprenticed to a civil engineer; served in the Scottish Royal Artillery; during the Crimean War planned the Moncrieff ordnance system, also called the protected barbette, or the disappearing system, for the invention of which he received \$50,000 from the British government. The important point in this system

is that the recoil of the gun is utilized to drop it out of sight after firing and to raise it again when necessary, a contrivance which did away with the cumbersome and expensive system of steel-plated forts. It substituted for them the simple, inexpensive Moncrieff pits, mere slight excavations for the masking of coast batteries. He received the honor of knighthood in 1890.

MONCTON, mūngk'tūn, city, Province of New Brunswick, Canada, a railway and industrial city in Westmorland County, on the Petitcodiac River which after an easterly course here bends sharply to the south and flows into Shepody Bay, the latter an extension of Chignecto Bay at the northeastern end of the Bay of Fundy. Moncton has a harbor of 30-foot depth at high tide equipped with Dominion government and private docks. One of the "sights" of the locality is the "bore," a wall of water sometimes 5 feet high which periodically rushes up the river from the tides of the Bay of Fundy. Railways and highways connect Moncton with all parts of the Maritime provinces and beyond. It is also on the Trans-Canadian highway and has a Trans-Canada Air Lines and Maritime Central Airways airport. The principal local industries (only very partially based on the lumbering and agricultural resources of the neighborhood) are a large railway and rolling stock industry, closely followed by slaughtering and meat packing. Biscuit and miscellaneous plants (steel products, chemicals, paints, woolens, aerated waters, etc.) make up the remainder of establishments. There are 11 churches, 3 parks, the Hotel Dieu and the Moncton Hospitals, a public library of 10,000 volumes, 3 daily newspapers (one French) and a semi-weekly newspaper, 7 banks, a Board of Trade and a junior Chamber of Commerce. Pop. (1941) 22,763; (1950 est.) 25,000.

MOND, mōnd, Ludwig, German industrialist and chemist: b. Cassel, Germany, March 7, 1830; d. London, Dec. 11, 1909. He was educated at the Cassel Polytechnic and the universities of Marburg and Heidelberg; went to England in 1862. He became a naturalized British subject in 1867. He entered the employ of the Leblanc soda works where he introduced his method of recovering sulphur from alkali waters. In 1872 (with Sir John T. Brunner) he started the alkali works, Brunner, Mond, and Company, which introduced the Solvay process of manufacturing ammonia soda into England; and continually improved this process. His alkali works at Northwich are the largest in the world. He invented a means of manufacturing chlorine as a byproduct of the ammonia soda process, and devised new gas batteries, new processes for manufacturing nickel based upon his discovery of nickel carbonyl, and a new method of producing gas for power and heating, ammonia being a byproduct. In 1896 Mond endowed the Davy-Faraday Research Laboratory at Royal Institution. He also formed the Mond Nickel Company with mines in Canada. His remarkable collection of paintings, bequeathed mainly to the National Gallery, London, has been described by J. P. Richter in *The Mond Collection, an Appreciation*, 2 vols. (London 1910).

MONDAY (moon and day; Saxon, *Monandæg*; German, *Montag*; Latin, *lunae dies*), the second day of the week, formerly sacred to the moon. See also CALENDAR.

MONDOVI, môn-dô-vê', commune, Italy, in the Province of Cuneo, Piedmont, 58 miles by rail south of Turin. Its chief building is the 15th-century cathedral of San Donato crowning the steep height of the upper town. Paper, pottery, machinery, etc., are among its manufactures, and it has a school of industrial arts and handicrafts. Near the city the Sardinians were totally defeated by Napoleon, April 22, 1796. Pop. (1943) 19,621.

MONER, mō'nēr, the simplest form of protozoan, regarded as the simplest known animal organism, and included among the rhizopods in the order Lobosa.

MONET, mô-ně, **Claude**, French painter: b. Paris, Nov. 14, 1840; d. Giverny, France, Dec. 5, 1926. He opened a new road to landscape painting by application of scientific principles deduced from the laws of light. His work, a magnificent verification of the optical discoveries made by Hermann Helmholtz and Michel Chevreul, forms the very basis of the impressionist movement with all its chromatic demonstrations of light and color. Suppression of local color and the study of reflections by means of complementary colors and division of tones by the process of pure, juxtaposed colors are the essential principles of impressionism. Monet's first luminous studies date from about 1885. For years he remained unknown.

Light is the real subject of his pictures. He often treated one and the same site in a series of pictures painted from nature at all hours of the day. The most famous of this series are the *Hayricks*, the *Poplars*, the *Cliffs of Etretat*, the *Little Juan*, the *Coins of Riveière*, the *Cathedrals*, the *Water Lilies*, and the *Thames*. Monet painted his series from nature. He noted, for example, from 9 to 10 o'clock the most subtle effects of sunlight upon a hayrick; at 10 o'clock he took up another canvas; and so on from hour to hour, he followed step by step the modifications of the atmosphere. He finished almost simultaneously the whole series. He painted a haystack in a field times over and the haystacks were all different; and when this series is exhibited the beholder can follow, led by the magic of his brush, the history of light playing on one and the same object, a dazzling display of luminous atoms, a presentation of atmospheric vitality. The shadows, true to nature, are lights where certain tones—blue, purple, green or orange—predominate exactly as happens in optic science.

Usually his subjects or motifs were simple; a hayrick, some slender trees, a cluster of shrubs or group of rocks. No one knew better than he how to place a rock amidst tumultuous waves, how to construct an enormous cliff or how to give the sensation of a group of pine trees blown and bent by the wind. Most unexpected tones play in the foliage and on the ground. On close inspection the beholder sees the canvas striped with orange, red, blue, and yellow touches of the brush, but seen from a distance the freshness of the green foliage appears as in nature. The eye of the beholder recomposes what the painter's brush has analyzed and dissociated. Monet is considered one of the greatest of all landscape painters. He understood and depicted with equal facility the true character of every soil and the true character of every kind of vegetation. Monet was also able to turn like all great artists from demonstra-

tions of power to displays of tender charm. His studies of the austere rocks of *Belle-Isle en mer* where heavy waves and blinding spray dash with fury over the granite rocks are unparalleled, while his series of *Water-lilies* express the melancholy and quiet beauty of sequestered pools where the water is thick with tangled stems and sleepy blossoms. Monet also painted the woods in autumn where the sunlight plays on tones of bronze and gold and red; chrysanthemums, dazzling sunflowers, tulip gardens in Holland; sailing boats on sunny rivers; and many portraits and other studies.

The series called *The Cathedrals* is famous. It consists of 17 studies of the west front of Rouen Cathedral, the towers of which fill the whole space of the picture. The gray stone, worn by time and blackened for centuries, is for 17 times made the theme for the painter's vision. Pale and rosy at sunrise and differently rosy and glowing at sunset, purple at midday, shrouded in mist or ethereal under the moonlight, the superb façade is reconstructed in the boldest way, yet producing the effect of its thousand details of architectural beauty and exhibiting the most dazzling and poetic atmospheric harmonies.

MONETARY COMMISSION OF THE UNITED STATES CONGRESS, a commission appointed in August 1876, by the 44th Congress, to inquire into the causes and economic effects of the decline in silver, the best means for resuming specie payments and other national monetary questions. The commission consisted of three senators, three representatives, and three monetary experts. Meetings were held in Washington and New York, during a period of six months. The results of the conferences were published by the government in monographs issued by the Treasury Department.

MONETARY CONFERENCES, INTERNATIONAL, meetings between nations for the purpose of reaching international agreements on monetary and banking problems.

In addition to the successful international monetary conferences held in 1865 and 1873, which respectively resulted in the Latin Monetary and the Scandinavian Monetary unions (see **MONETARY CONVENTIONS**), numerous less fruitful monetary meetings have been held. Encouraged by the success of the Latin Union (q.v.), of which she was a member, France in 1867 invited all the powers to participate in the First International Monetary Conference at Paris, for the purpose of relieving problems of international exchange, and possibly to attract further membership in the Latin Monetary Union. Eight meetings were attended by representatives of 18 European nations and the United States. One of the principal topics of discussion involved the question of establishing uniformity of coinage. Two important decisions were reached: (1) that it would be more practicable for the nations involved to adopt as a uniform standard some already existing monetary system than to invent a new standard; and (2) that gold was the only standard which was adapted to international money. However, no formal treaties involving conference recommendations were contracted, and little was actually accomplished except to open the way to further discussions.

Throughout the 19th century the struggle between gold and silver constituted a major fiscal problem, in connection with which the United States government solely or jointly initiated three international monetary conferences. The first of these, called the Second International Monetary Conference, was launched by an act of the United States Congress on Feb. 28, 1878, which directed the president to invite European nations to join in a "conference to adopt a common ratio between gold and silver for the purpose of establishing internationally the use of bimetallic money, and securing fixity of relative value between those two metals." Behind the conference lay the need to offset a potentially serious depreciation in the value of silver, caused, among other factors, by the increasingly large production of silver in the United States. Twelve nations participated in the conference, held in Paris. The United States submitted proposals calling for the unrestricted coinage of silver and its use as legal tender, and advocated a bimetallic standard on the basis of a fixed ratio between gold and silver. The attending European nations rejected the American requests by insisting that conditions within individual nations should determine the monetary functions of both silver and gold, and that the selection of either currency or both "should be governed by the special position of each state or group of states." The discussions ended without mutual agreement respecting American proposals.

In the next few years England and France met with seriously diminished gold reserves; the United States was being forced to import gold, which upset the European market; and Germany was unable to find a satisfactory means of disposing of her stocks of silver. To handle the problems posed, the French and American governments joined in calling the Third International Monetary Conference, which 19 nations attended in Paris in 1881. The nations recommended the establishment of a $15\frac{1}{2}$ to 1 ratio of silver and gold and then adjourned to allow the various nations to consider the proposition before reconvening on April 12, 1882. The conference was not reassembled.

The Fourth International Monetary Conference was called by the United States to consider what measures might be taken "to increase the use of silver as money in the currency system of nations." Twenty nations were represented at sessions held in Brussels during November 1892. Lengthy discussions produced various schemes for a bimetallic standard and for the wider circulation of silver through a cooperative system. The conference finally adjourned without formal agreements, although a subsequent meeting was set for May 30, 1893, but was never held.

In 1922 another international monetary conference was held at Genoa to combat postwar inflationary trends. It accomplished little, primarily because of the effects of unstable monetary conditions in Germany. However, it was followed by a London conference, beginning on July 16, 1924, which involved 10 nations in discussions regarding monetary difficulties, particularly in Germany. The conference agreed on the so-called Dawes plan (see DAWES, CHARLES GATES), which had earlier been accepted on April 16 by Germany and was later signed on Aug. 16, 1924.

From June 12 to July 27, 1933, the famous London Monetary and Economic Conference was held, at which American Secretary of State Cordell Hull (q.v.) presided. The conference sought

to reach an agreement on currency stabilization but virtually disregarded the equally important problems of war debts and reparations. On July 3, President Franklin D. Roosevelt issued his unexpected "bombshell" message, which expressed disapproval of the course of action taken by the conference. After this setback, the meetings wavered on for a few weeks, but ended in failure.

Before the conclusion of World War II, the United States, in planning to meet postwar reconstruction needs, called a monetary and financial conference which met in June 1944 at Bretton Woods, N. H. This meeting differed from earlier monetary conferences in emphasizing international banking rather than international currency agreements. Here plans were made for the creation of the International Monetary Fund and of the International Bank for Reconstruction and Development.

R., *International Monetary Issues* (New York 1937); Hahn, G., *International Monetary Cooperation* (Chapel Hill, N. C., 1945); Morgan, C., *Bretton Woods: Clue to a Monetary Mystery* (United Nations 1945).

MONETARY CONVENTIONS, conferences between European nations for the regulation of their coinages. Two such conventions have been held which resulted in the Latin Monetary Union (see LATIN UNION) and the Scandinavian Monetary Union. The former included France, Belgium, Italy, and Switzerland, by an agreement of December 1865, under which these nations' coinages became of uniform weight and fineness. Greece joined the union subsequently. Spain, Austria, Finland, Rumania, Bulgaria, and other European nations later also coined large amounts of either or both gold and silver money, which were identical in weight, fineness, and value with the standards established by the Latin Union.

MONETITE, mōn'ê-tit, a native acid phosphate of calcium, CaHPO_4 , occurring in massive and in small, triclinic crystals, in the islands of Moneta and Mona, in the West Indies. The mineral is found in limestone, beneath a deposit of guano.

MONEY. In an economic sense, money is any medium of exchange which is widely accepted in payment for goods, services and debts without reference to the standing of the person offering it in payment.

In our highly specialized modern economy with its extreme division of labor, money is as necessary in the exchange of goods and services as language in the exchange of ideas. It is truly indispensable; in fact, if it does not function properly production, distribution, employment, and our very standard of living and well-being are directly affected. Because of this great importance, authorities in many fields have devoted much study to the nature, functioning, and phenomena of money with the result that views and definitions are legion—and vary as widely as the divergent aims and different backgrounds of their sponsors.

Some authorities maintain that use of the term *money* should be restricted to whatever serves as

he standard of value; others insist that "money is what money does," therefore, they say the term should encompass all the instrumentalities, especially the obligations, which affect exchanges, such as checks, notes, drafts, mortgages, charge accounts, etc. Admittedly, it is very difficult to differentiate a complex concept such as money from all other economic and social concepts but it can be fairly said that all monetary concepts stress the aspect of standard of value, or that of medium of exchange, or both.

Relation of Money and Credit.—One of the main difficulties in getting a clear-cut concept of money is the overlapping of *money* and *credit*. Practically all modern money has an element of credit—in fact, a great deal of it is 100 per cent credit. This characteristic and the indiscriminate use of the words *cash*, *money*, and *credit* compound the confusion. In view of this, it is important to develop a workable (if not absolutely perfect) concept of credit, which will differentiate it from money.

The term *credit* is used in many different connections and with many different meanings. For the purpose of an understanding of money, however, credit may properly be defined as a promise to pay money. It must be immediately admitted, however, that most such promises are redeemed with credit rather than with money. This is understandable, as in an important sense credit is merely a postponed payment of money; that is, it is the term applied to a common and important use of money, namely, that of deferred payment.

Relation of Money, Credit, and Prices.—In the first half of the 20th century, the relation of money, credit, and prices was by far the most active field of economic inquiry. The "dance of the dollar," as the fluctuating price level was sarcastically characterized, became the preoccupation of economists, bankers, and politicians alike. Pressure groups were organized, books written, and political campaigns fought on different theories of eliminating the upward and downward swings of prices and business activity. The social injustice of the transfers in purchasing power from debtors to creditors, and vice versa, through changes in the price level, became generally recognized. The wide variations between minimal purchasing power and *real* purchasing power became more fully comprehended through development and wider usage of index numbers. Steadily the conviction developed that the price level should be made to serve man rather than the contrary. Laws were passed and policies developed in an effort to make money a *means*, rather than an *end*, or *result*, of economic activity.

A clear idea of the terms *price* and *value* will be helpful in securing a better understanding of the relation between money and credit and price behavior. The *value* (exchange value) of a thing is its purchasing power over all other goods and services. In this sense, value is measured by the quantity of other things for which a thing can be exchanged. For example, a bushel of wheat is exchanged for two bushels of rye, or three bushels of corn, or ten gallons of gasoline, or two hours of common labor, and so on. These and countless other ratios measure the value of wheat, in the limited sense (exchange) in which value was used above; so, the complexity of value determination—even of such simple value as exchange value—is obvious.

The price of a thing is its purchasing power

over money, that is, the amount of money for which it can be exchanged. In other words, price is value expressed in terms of money. Money, therefore, has no price—it has only value. It follows that a general rise or fall in prices merely reflects a change in the value, or purchasing power, of money. The value of money falls as the general price level rises, and rises as the price level falls. This behavior pattern is summarized by the economist in this fashion: "The value of money is inverse to the level of prices."

There are many theories of the relation between money and price behavior. The boom of the 1920's, and the great depression of the 1930's, with their vast monetary experiments, conclusively demonstrated that all such theories leave much to be desired. The imponderability of the so-called human element, in fact, the perversity of human reaction, is so great that the relation between money and prices cannot be reduced to the comforting certainty of a principle or law. The explanations are still very much *theories*.

The *quantity theory of money*, which holds that the value of money (that is, the general price level) depends on its quantity and that *ceteris paribus* (other things being equal) prices will vary directly with the quantity of money in circulation, has the virtues of seniority, simplicity, and surface logic. It also enjoys the widest acceptance of any of the theories. Nonetheless, in its simplest form it leaves much to be desired. In particular, through the *ceteris paribus* device, it overlooks the basic importance of *demand*.

Irving Fisher's mathematical presentation of the factors which affect the general price level is a much more comprehensive and acceptable concept of monetary and price behavior. His basic formula is: $MV + M'V = PT$. In this statement, *M* is the quantity of money, *V* is the velocity of its circulation (turnover), *M'* is the total of demand deposits subject to check, *V'* is the velocity of such deposits, *P* is the price level and *T* is the volume of trade.

Although frequently called the mathematical statement of the quantity theory of money, Fisher's formula is more properly the *equation of exchange*. It is, in fact, a mathematical statement of any theory of money, since it is a truism. This equation clearly indicates that an increase or decrease in velocity, or an increase or decrease in goods may affect prices just as much as a change in the quantity of money. Thus, it would be just as logical to call this the goods theory of prices or the velocity theory of prices. Moreover, it obviously does not explain why people decide to change from money to goods, in the first place—from an economic standpoint, it is an after-the-event presentation.

This overemphasis on quantity was at the bottom of the government "pump-priming" of the 1930's; but it failed, as it disregarded the basic fact that velocity (turnover) is largely controlled by the public. In fact, as the government increased the quantity, the public decreased the *velocity*.

The overemphasis on quantity inherent in the quantity theory causes people to overlook the great effect of prices on the quantity of credit (*M'*) in the modern economy. In fact, the amount of *M'* brought into existence by the banker is determined by the price level rather than the opposite. As a practical matter, the amount of a loan (quantity) is calculated by multiplying the number of units desired by the

market price of each unit. To be sure, after the credit is brought into existence, it will probably affect prices; but not necessarily: the public may commensurately slow up velocity or even increase the quantity of goods.

Kinds of Money.—Basically, there are three kinds of money: (1) commodity money, (2) credit money, and (3) fiat money.

Commodity money is money the monetary value of which approximates the value of the material it contains. Its value as a commodity is substantially the same as its value as money. Thus, with gold at \$35.00 an ounce, a five-dollar gold coin containing one seventh of an ounce of pure gold would be commodity money. By the same token, with the market value of silver at seventy-five cents an ounce, a silver dollar containing one and one third ounces of silver would be commodity money.

Commodity money is usually, although not necessarily, metallic money. As a result of their widespread usage for this purpose, gold, silver, and copper are known as the monetary metals.

Because of greater convenience, and resulting public preference, commodity money usually circulates in representative form. For example, instead of a heavy silver dollar, a piece of paper giving title to the same amount of silver kept in the United States Treasury circulates. The same is true of gold if a country is on a gold basis. By means of *representative money*, commodity money circulates, it might be said, by proxy.

Many writers treat *representative money* as a distinct kind of money. In view, however, of the almost universal modern practice of keeping the monetary metal in one common pool (reserve) and having it circulate by proxy, it seems more realistic to consider representative money as the form in which commodity money generally circulates.

Credit money is the term used to designate all credit instruments widely accepted in payment for goods, services, and debts without reference to the standing of the person tendering them. Credit money, being itself a promise to pay money, presupposes the existence of another kind of money in which it may be redeemed. This money of redemption is known as standard money whereas credit money is frequently termed fiduciary money because of the element of trust.

Quick and easy redemption is the key to the general acceptability of credit money. So long as no barriers are placed in the path of redemption its value will naturally be the same as that of the money in which it can be redeemed, even though redemption never takes place. Any restriction on redemption will cause credit money to depreciate in terms of standard money to the extent of holders' estimates of the extent and duration of the limitation.

It should be noted, however, that complete loss of all faith in ultimate redemption will not necessarily mean that the inconvertible money will lose all of its value. This is because the monetary use itself creates a demand for the money and thus gives it a value. This is especially true if the quantity of credit money is controlled so that there is a scarcity of it relative to the demand for it for monetary purposes. The value of such inconvertible money is often further increased by the willingness of the government to accept it in payment of taxes at face value or some relatively high percentage of such

value. In addition, the government may further bolster its value by making it *legal tender* for private debts, that is, by requiring creditors to accept the money at par in payment of all debts and claims.

Credit money is ordinarily paper money, although, as will be seen in the next section, not all paper money is credit money. Much of the paper money issued by governments and all bank notes are credit money.

It should be added that the subsidiary coins are usually made with a disproportionate weight or of a cheaper metal than the standard money so that the express, or implied, promise to redeem them contributes to their value. To the extent that their value derives from the promise rather than the silver, copper, nickel, etc. they contain, these subsidiary coins are credit money. This is true of all our minor coins (such as pennies and nickels). It is also true of our silver coins as they contain less silver by weight than the ratio of their fractional value to the unit indicates. In short, a half-dollar does not have one half as much silver as a silver dollar, nor does one quarter have one fourth as much silver as the silver dollar. This reduction of weight, of course, affects the value but the overvaluation of silver for coinage purposes causes an even greater spread between its value as a commodity and its monetary value. The reasons our coins are credit money are thus quite obvious.

Fiat money is the term used to designate money by government command. The name pointedly indicates this as the Latin word *fiat* means: let it be done. Since it becomes money only through fiat, it must be issued by government, or under the specific order and protection of sovereignty. For example, when a government takes a piece of any material and stamps or prints on it that it is so many units of money, regardless of its value as a commodity, and without making it redeemable, or convertible into other money, then forces such pieces into general circulation, that is fiat money. The essential feature of all fiat money is that its value is independent of the material from which it is made, as well as independent of any promise of redemption in other money.

Fiat money usually starts out as credit money issued under varying degrees of good faith. As redemption or maintenance of other promises becomes burdensome, increasing limitations and restrictions are introduced until repudiation is a tacit, even though not admitted, fact. Because of custom, tradition, and social inertia, such money will continue to circulate, although at a lower value. The value it will have will be affected by the extent to which it has been made legal tender and by its acceptability by the government for public dues. In addition, of course, its value will be affected by the quantity issued relative to the demand for it for monetary purposes, as that is the most important determinant in the value of all inconvertible, or fiat monies.

Paper Money.—In its narrow, and correct, sense, paper money is merely the *form* in which most of the other kinds of money circulate. In the public mind, however, it is more closely associated with fiat than with either credit or commodity money. This may well be a folk memory, as the history of "paper money" is more interesting than reassuring!

Although paper is supposed to have been invented in China in the year 177 B.C., the Chinese

did not get around to using it for money until more than a thousand years later. In the early part of the 9th century, what is thought to have been the first issue of true paper money was put out for the ostensible purpose of avoiding the difficulty of carrying around the heavy iron and copper coins used in the trade of that day. Since that time the evils, abuses, fraud, and economic dislocation flowing from the unprincipled and unwise use of paper for money have caused even more suffering than that other famous Chinese invention, gunpowder.

It is the indisputable lesson of history that sooner or later, and usually sooner, all paper money declines in quality—representative money becomes credit money, credit money becomes fiat money, and fiat money becomes the epitome of worthlessness. Even to this day, the "not worth a Continental" term which arose from the extreme depreciation of the Continental currency of revolutionary times, indicates complete lack of value. The final destruction of value, of course, comes from the excessive issue of the paper "money."

In paper money, the evil of overissue must be fought continuously. It is so tempting and so easy to print more unsupported "paper" money that it is fed into circulation in such excessive amounts that sharp depreciation, and even utter collapse of value, become inevitable. Overissue, or currency inflation, as it is commonly known, is easily recognized by those honest enough to face facts; and the remedy is well understood. But it is like a narcotic; those that should stop the inflation lose all desire to do so. The artificial economic well-being engendered by the expansion causes men to act as if the millennium had arrived until the day of reckoning descends upon them and their economic world collapses.

Some 150 years ago the French blazed such a spectacular downward trail with their *mandats* and *assignats* that it should have served to end currency tinkering for all time; but not so. Since then the nations of the world have trod this trail into a well-beaten downward road. To mention but a few outstanding cases, the Confederate money of Civil War days, and the German mark, Italian lira, French franc, and other currencies, too numerous to mention, of the post-World War period conclusively demonstrate that it requires more than *fiat* to make money out of paper. Yet nations continually try to do so, even though history indicates that the ultimate consequences are foredoomed.

The great tragedy of currency inflation is that it is practically impossible to reverse the depreciation process. Once a nation sets its feet upon the economic primrose path, of "easy money," it finds the descent ever steeper, the going ever more slippery, and the downward rate ever faster and faster. Because of this, paper money has been bitterly assailed as the greatest affliction ever visited on mankind. But such criticism is misdirected. It is the abuse, not the use, of paper money which causes the suffering. Properly used, paper money is undoubtedly the greatest convenience ever devised by the wit of man. It should be treasured as one of our blessings and protected from those who would misuse it, for whatever purpose.

Deposit "Money."—Demand deposits (those subject to check) are considered as money by many modern authorities. Certainly, they constitute by far the most important medium of ex-

change, especially in the more advanced countries. Economists estimate that more than 90 per cent of the dollar volume of all monetary transactions in the United States and Canada is through the medium of bank deposits, so they truly do a large part of the medium of exchange work of money. But it also must be admitted that checks, the form in which they do this money work, do not pass from hand to hand as does money. Checks can, of course, and do frequently, continue to pass from hand to hand by *endorsement* (they could be drawn to *bearer* and pass by delivery but this is rarely done) but generally they are deposited in a bank at the first opportunity. In fact, if not promptly presented, payment may be contested on the equitable ground of *laches* (delay in exercising rights). They not only do not circulate freely by delivery as does true money, they are also not accepted without reference to the credit standing of the issuer. Checks and bank deposits are thus credit, and not money, even though they do the major part of our exchanging and even though bank deposits constitute the largest store of liquid value in a country with a modern banking system like that of the United States or Canada.

Functions of Money.—The many services rendered by money may be grouped under four functional headings: (1) standard of value; (2) medium of exchange; (3) standard of deferred payments; and (4) store of value. Although these are basic functions, they vary greatly in relative importance from time to time and country to country. For instance, during the 1930's in the United States, it was thought necessary to restrict certain functions so that a managed money could be introduced.

In reading the following explanations of specific functions, the dynamic nature of money should be kept in mind. Money is dynamic; its functions are dynamic. This is necessarily so as the economy it serves is highly dynamic.

Standard of Value.—It is as a common denominator of value that money renders its greatest service. Without such a pecuniary language device, modern business would not be possible. Record-keeping, accounting, and finance stem from this function of money.

As can be readily seen by referring to the article on CURRENCY, man's standards of value down through the years have been legion, in fact, almost infinite. It is difficult to find anything in common usage in the past which has not served some time, some place, as the standard of value. Why a particular thing was used at a particular time is for the anthropologist and sociologist to determine; sufficient for the student of money is the fact that it was so used.

The necessity of a standard of value, even in the earliest times, is apparent because of the utter inconvenience of barter (exchange of one good for another good). The difficulty of finding the necessary double coincidence of demand and supply made it imperative to devise a separate standard so that the division of labor with its many benefits could develop.

In its earliest forms, money was a commodity with such scarcity and such utility (whether for adornment, as in the case of shells, or for further production, as in the case of the cow) that it was generally desired. The fact that some commodity became the standard of value does not mean that it did not change in value. On the contrary, crop failure, wars, and other disasters fre-

quently caused great changes in the value of the standard itself. In addition to the changes in value flowing from physical factors, even greater changes frequently came from psychological factors. Without apparent "rhyme or reason" people sometimes just decided they did not like a thing as well as they did before. They still do this at times, so it is fair to say that there never has been, and conceivably never will be, any standard of value which will be immutable and unchangeable. At least, as long as people can change their minds, the so-called standard of value will fluctuate in purchasing power. The problem is people; not the standard.

Even though no perfect standard of value seems possible, the evils of severe or violent changes in the price level make it highly desirable to use the most stable money substance and, in addition, to do everything possible to keep upsetting psychological pressures to a minimum. Admittedly it is well-nigh impossible to keep people from acting "bullish" when they feel "bullish" and from acting "blue" when they feel "blue"; but the attempt must be made; and if it fails, the blame should be placed where it belongs.

In modern times the standard of value has often been separate and distinct from the medium of exchange. In other words, the unit used for the standard of value need not be used widely, nor even at all, as a medium of exchange. Accounts may be kept in any money specified by law or dictated by tradition. A good example of the complete separation of the "money of account" and the medium of exchange is the United States gold dollar. Other than for memorial and exposition purposes, the gold dollar has not even been coined since 1889, much less freely circulated. Nonetheless, it is the unit in which all records are kept and calculations made.

It has been said sarcastically that it is as a standard of value that money functions most poorly, yet that is the only function which has not declined markedly in importance in recent years. The evils of severe and catastrophic changes in prices are not as great as those of attempting to function without a common denominator of value. Truly, this is the indispensable function of money.

Medium of Exchange.—Through its function as the medium of exchange, money made possible the "division of labor" with its tremendous increase in production. In this respect alone, money has rendered incalculable service to mankind. In our time, as was explained above, this function has largely been taken over by checks, or "deposit money."

From the money side itself, the use of gold, or even gold certificates, as a medium of exchange in the United States was prohibited by Executive Order on April 5, 1933. This was done even though the gold dollar then, and thereafter, was declared by law to be the standard of value. In particular, the Gold Reserve Act of 1934 provided that all gold coin should be withdrawn from circulation and melted into bars and prohibited further coinage of gold in the United States except for foreign account.

Money is thus no longer the medium of exchange in the United States; in its true form it is no longer even a medium of exchange; it is, however, in its credit form a minor factor as a medium of exchange. But even though this is the case, this function should not be "written off." Economic disorganization, banking difficulties, or

any other factor which reduces public confidence would make the medium of exchange services of this credit money an extremely important function again.

Standard of Deferred Payments.—Modern man differs from his ancestors in increased ability to plan ahead and increased ability to borrow. The pledge of anticipated income to secure goods and services for immediate use and enjoyment is characteristic of business and individuals. The ability of the active, enterprising members of society to command the capital and credit they need for their ventures is an outstanding advantage of our competitive capitalism. It is made possible by several factors, but the basic one is the existence of a standard of deferred payment.

Such a standard permits planning and encourages saving. All manner of contracts extending far into the future can be made in confidence if the deferred portion of the performance can be put on a standard basis. Prior to 1933, in the United States, such contracts were usually made payable in "gold dollars of the present standard of weight and fineness" and sometimes even a gold as a commodity by weight without reference to the monetary unit. Now all of this has been changed by Joint Resolution of Congress, approved June 5, 1933, which forbade the use of a "gold clause" and provided that "every obligation heretofore or hereafter incurred," whether or not it contains a gold clause, "shall be discharged, upon payment, dollar for dollar, in any currency which at the time of payment is legal tender for public and private debts." This means that the money of circulation will be the money of payment in the future. The extent to which that will be a standard from one period to another period remains to be seen.

Store of Value.—The other three functions of money naturally lead to its use as a store of value. As deposit banking has developed to a high degree in many countries and as hoarding has been made illegal in most countries with positive steps taken by governments to keep it at a minimum, the store of value function has declined in importance in recent years. It has, also, declined because in most countries money no longer has commodity value, nor can it with certainty, and under all circumstances, be changed into the money commodity, or other commodities, at a specific rate.

In ordinary times, individuals keep on hand comparatively small amounts of "pocket money" for small purchases, carfare, etc. Likewise, business organizations keep small amounts on hand as petty cash and for making change. Larger amounts are needed for payroll purposes if a cash payroll is used but that usually comes directly from the bank to the payment window. Banks of course have to keep substantial amounts of money on hand to cash checks and otherwise serve their depositors.

The demand for money, or currency, varies with the swings of the business cycle, with the ups and downs of public confidence, and with the seasons. Thus, the need for additional money during the Christmas shopping season is well known. Nonetheless there really was little excuse for the wide swings and the great increase in money in circulation in the United States which characterized the period after World War II, as demand deposits were freely convertible into money and more than half of the assets back of these deposits were government bonds.

In fact, as stated earlier, bank deposits constitute the principle store of liquid purchasing power in the United States. As they ordinarily total some six times the amount of money in circulation outside of the banks and the Treasury, they have, for the reasons enumerated, largely taken over the store of value function formerly rendered by money.

Qualities of Good Money.—By definition, general acceptability is a prerequisite quality of money. Relative stability of value is also extremely important. Serious maladjustments between debtors and creditors, savers and enterprisers, pensioners and organized workers, and between the many other classes in society arise when the purchasing power of money fluctuates sharply or changes permanently. Complete stability is, of course, unattainable as that would mean that the effective supply (actual units multiplied by the turnover) would have to vary sensitively and perfectly with each change in the demand for it for monetary or any other uses to which it is put. The necessary exact adjustment between supply and demand has never been achieved in practice. Many promising theoretical plans to achieve the desired stability have been advocated but, so far, none has succeeded.

The other qualities of good money apply primarily, or solely, to coins, which are treated elsewhere, so they will only be briefly mentioned here. Portability, or relatively high value per unit, is an important quality. Divisibility, or the ability to divide the monetary commodity into exact fractions without waste or difficulty and then recombine them, is another essential quality. These divisions must be equal in all respects or *homogeneous*. (Metals such as silver and gold have the qualities of divisibility and homogeneity in high degree; cows and diamonds do not.) The money substance must be malleable enough to be shaped properly, easily recognizable, and sufficiently durable to hold its design during long periods of use.

Summarizing, the eight more important qualities of good money are: general acceptability, stability of value, portability, cognizability, divisibility, homogeneity, malleability, and durability. In practice, gold has demonstrated that it possesses these qualities in higher degree than any other substance although it must be admitted that it has proved distressingly unstable in value.

Monetary Standards.—The expression monetary standard refers to the money in which credits are ultimately redeemable in a country. If gold is the money of redemption, the country is said to be on a gold standard. *The standard money must be either commodity money or fiat money; it cannot be credit money because it is, itself, redeemable in some other kind of money.*

Although various metals have been used as standard money, the special qualities of gold and silver have made them preferred above all others since the beginning of the Christian era. In more recent times increased production and economies in its monetary use have enabled gold to outstrip silver as a monetary base. The way in which the monetary commodity is utilized is an integral part of the monetary standard. The relative scarcity of the monetary metals has caused considerable ingenuity in their utilization. In the following explanations of the physical details of the various standards, gold will be used for the single metal standards, as it is the conventional monetary base; but it should be un-

derstood that silver, platinum, copper, or any other metal could be similarly used if public preference focused on it.

Gold Coin Standard.—The essentials of a full gold coin standard are: (1) adoption of a definite quantity of gold of a certain fineness as the unit; (2) full legal tender for the gold coins; (3) all legal tender money redeemable on demand in gold coins at par; (4) unlimited and free coinage of gold (with no more than nominal seigniorage, that is, deductions); (5) unrestricted exportation and importation of gold in any form.

Disregard or violation of any of these essentials limits the full gold coin standard by just that much. Because of the danger of public hoarding, nations in recent times have so restricted this standard that in its true form it has become merely a historical curiosity.

Gold Bullion Standard.—This monetary standard, which is the one used by most of the advanced countries, is exactly the same as the gold coin standard except that coinage is dispensed with, that is, the gold is kept in bars. In practice, however, the gold bullion standard is always modified by restrictions on the minimum amount of bullion which will be issued for other forms of money. This is often put quite high to "economize in the use of the gold"! In addition, nations usually specifically reserve the right to determine whether a particular use of the gold is in "the public interest." Thus, on the specious basis that gold is not needed by the domestic population as either a medium of exchange or a store of value, it may be released only to fill the demonstrated needs of industrial users and only for exportation. Although all such limitations constitute a departure from the full gold bullion standard, they are inherent in this standard, in practice. After all, the purpose in adopting a gold bullion standard, rather than a coin standard, is to remove all gold from internal circulation and reserve it solely for use in meeting the needs of industry and in settling international balances.

Gold Exchange Standard.—This standard is the same as the gold coin standard except that, instead of coin or bullion, gold exchange (a demand draft on a country on a gold standard) is used for the redemption of legal tender money. The gold exchange standard was quite popular among the "have not" and politically dependent nations for a while after World War I; but the wholesale departures from the international gold standard in the 1930's gave this monetary device a blow from which it will probably never fully recover.

Bimetallic Standard.—In this system the monetary standard is defined as either of two metals, a definite quantity and fineness of each being stipulated as the unit. It has the same features as the gold coin standard with respect to redemption, legal tender, free coinage, and unlimited exportation and importation. Although the bimetallic standard could be on either a coinage or a bullion basis, so far only coinage has been tried. The results have, in general, been unsatisfactory. Rather than enumerate the theoretical advantages and disadvantages, the heretofore insuperable problem in the actual operation of a bimetallic system will be explained. This fatal handicap is the tendency for cheap money to drive dearer money out of circulation. This is commonly known as Gresham's Law, after Queen Elizabeth's master of the mint, Sir Thomas

Gresham, who was one of many to call attention to the phenomenon.

In a bimetallic system Gresham's Law operates in this fashion: After the mint ratio of the two metals is fixed, any change in the world market value of one with relation to the other would cause the metal with the higher value to begin disappearing from circulation. This is so because of the obvious fact that people will hold the more valuable money and pass on the less valuable whenever they have a choice. The fixed mint ratio gives them exactly such a choice. This was conclusively demonstrated on a vast scale in the American experience with the bimetallic standard through the 19th century. One or the other of the metals was always disappearing from circulation. Thus, during the first period of legal bimetalism in the United States (1792-1834), gold went out of circulation, but in the second period (1834-1873) silver went out. Following 1873, however, the political power of the silver bloc was so great in legislative halls, that silver was usually overvalued, so it circulated while gold "did the disappearing act"!

Symmetrical Standard.—In this proposed system, the monetary standard would consist of a definite quantity of a combination of two or more metals. Redemption would be in symmetrical coins or bars, or in all of the component metals separately; likewise, issue would require presentation of definite quantities of all the component metals. Although this method would reduce the hazards of Gresham's Law to a minimum, it has so many obvious disadvantages that it has never been tried in practice.

Compensated Standard.—This new term for Irving Fisher's "stabilized dollar" is another scheme to secure more stability in the standard of value. The method proposed is that of periodically varying the quantity of metal in the unit, which would, because of this variation, be kept on a bullion basis. The proposal has the virtue of simplicity: as the unit becomes more valuable and prices decline, its metallic content would be decreased; as the unit becomes less valuable and prices rise, its metallic content would be increased.

The reduction of the gold content of the United States dollar from 25.8 grains of gold .9 fine to 15 5/21 grains .9 fine in January 1934 and the temporary permission given the president to further alter the gold content within certain limits is an instance of a passing "flirtation" with the compensated dollar idea. An important part of this "flirtation" was the gold buying activity through the Reconstruction Finance Corporation in the months before the approval of the Gold Reserve Act on Jan. 30, 1934. This is as near as the compensated standard has ever come to being adopted. It should be added that although the proposal has been made only in connection with gold, it would be equally adaptable to any of the other metallic standards.

Fiat Standard.—A fiat standard is whatever the government makes it. The essential difference between it and any other standard is that the monetary value must be substantially higher than that of the material contained in it and it must not be a promise to pay some other kind of money, that is, no assurance is given on redemption. In short, a substantial portion of the value of the standard must flow from the power of government. The characteristics and defects of such a monetary unit are given in the section on

fiat money; those defects are likewise inherent in a fiat monetary system. In passing, it should be noted that Gresham's Law outlined in the section on bimetalism, operates in this field, too, as some fiats are worse than others.

Managed Money.—A large degree of management or control is attempted in practically all modern monetary systems. In a country like the United States, where bank deposits are freely interchangeable with money, such management is, in reality, credit management. Money behavior in this country is almost entirely corollary to developments on the credit side. The monetary authorities, therefore, concentrate their attention on credit control and, in general, permit the "chips to fall where they may" on the money side. Unfortunately, "money management" carried to the extreme, as has been the case in many countries, usually forces a country downhill to a fiat basis.

In a narrower sense, the establishment of exchange stabilization funds and similar direct government intervention may be termed money management.

Monetary System of the United States.—The unprecedented outpouring of monetary legislation and executive orders in the 1930's changed the basic character of the United States monetary system. Gold was "nationalized"; contract calling for payment in gold were abrogated, the weight of the dollar was drastically reduced and many other things were done with the result that it could be fairly said that a new monetary system was inaugurated.

In essence, this new monetary system is based on a highly restricted, international, administrative, gold bullion standard. Gold is no longer coined; nor is it available for domestic monetary use. Moreover, no currency is redeemed in gold for any purpose except such as the treasury may permit by regulation or special license. The Federal Reserve banks no longer own gold; they have instead "gold certificates" which in the language of the law "shall be redeemed at such times and in such amounts, as in the judgment of the Secretary of the Treasury, are necessary to maintain the equal purchasing power of every kind of currency of the United States."

The automatic regulation features of the old gold standard have thus been abandoned. In its place, there has been substituted government discretion and expediency. Inherent in such a system is the possibility, even probability, of tremendous inflation. As a practical matter, control of the monetary system has been given to the executive branch of the government instead of the central bank authorities. Only the future can tell whether such a "managed" money can be managed.

were all, in point of fact, used as money, in different ages and different countries; but they have long ceased to be so used, by commercial nations. The high estimation in which the precious metals have been held, in nearly all ages and all regions, made it practicable to use them as money. The scarcity of gold and silver, the need of bills of exchange and the want of a money more convenient for the individual to carry, and lastly, the issuance of government credits forced on bankrupt nations, brought about the use of paper money in European countries, and Colonial America early adopted this medium of exchange from the English.

Provincial Paper Money.—In the earliest days of America paper money was first issued by Massachusetts in 1690. The object was not to supply any supposed want of a medium for trade, but to satisfy the demands of some clamorous soldiers. Other issues were subsequently made, partly with a view of defraying the expenses of government and partly with a view of making money plenty in every man's pocket. The ill-judged expedition of the Carolinas against Saint Augustine, in 1702, entailed a debt of £6,000 on that colony, for the discharge of which a bill was passed by the provincial assembly for stamping bills of credit, which were to be sunk in three years by a duty laid upon liquors, skins and furs. For five or six years after the emission the paper passed in the country at the same value and rate as the sterling money of England. To defray the expenses of an expedition against the Tuscaroras and to accommodate domestic trade the legislature of South Carolina established a public bank in 1712 and issued £48,000 in bills of credit, called bank-bills, to be lent out on interest on landed and personal security, and to be sunk gradually at the rate of £4,000 a year. Soon after the emission of these bank-bills the rate of exchange and the price of produce rose, advancing in the first year to 150 and in the second to 200 per cent. By the year 1731 the rate of exchange rose to 700, at which it continued with little variation upward of 40 years. In the year 1723 the province of Pennsylvania made its first experiment of a paper currency. It issued in March £15,000 on such terms as appeared likely to be effectual to keep up the credit of the bills. It made no loans but on land security or plate deposited in the loan office; obliged the borrowers to pay 5 per cent for the sums they took up; made its bills a tender in all payments, on pain of confiscating the debt, or forfeiting the commodity; imposed sufficient penalties on all persons who presumed to make any bargain or sale on cheaper terms in case of being paid in gold or silver, and provided for the gradual reduction of the bills by enacting that one-eighth of the principal as well as the whole interest should be annually paid. These early specimens of provincial paper money were large notes, printed from copper-plates, having engraved borders on three sides. The inscriptions on the bills were in type, with arms or motto engraved in the left side centre. The signatures of the province officials were signed in red ink.

Continental Money.—The first issue of paper money under the authority of the Continental Congress was dated 10 May 1775, but the notes were not actually placed in circula-

tion until the August following. On 31 May 1781 the continental bills ceased to circulate as money, but they were afterward bought on speculation at various prices, from 400 for one, up to 1,000 for one. The value of continental paper was not the same in different parts of the country. The exchange was, for example, at 35 for one in New England, New York, the Carolinas and Georgia, and at 40 for one in Pennsylvania, New Jersey, Delaware, Maryland and Virginia. An account taken from the books of merchants in Virginia shows that the depreciation there regularly followed that in Philadelphia, though, toward the close, it sometimes lagged a month or more behind. Thus when exchange was in Philadelphia at 100 for one, in January 1781 it was in Virginia at 75 for one. As late as May 1781 speculations were entered into at Philadelphia to purchase continental money at 225 for one and sell it at Boston at 75 for one. It is worthy of remark that the depreciation of continental money never stopped the circulation of it. As long as it retained any value at all it passed quickly enough, and would purchase hard money or anything else as readily as ever when the exchange was 200 for one, and when every hope or even idea of its being ultimately redeemed at nominal value should have entirely vanished. The facility of raising ways and means, in the early part of the Revolutionary War, by issues of paper, led to much extravagance in the commissary department and prevented the establishment of a sound system of finance. It is said that when a proposition was before Congress to establish a regular revenue system one member exclaimed, "Do you think, gentlemen, that I will consent to load my constituents with taxes, when we can send to our printer and get a wagon load of money, one quire of which will pay for the whole!"

Connecticut.—Under date of 4 March 1762, Connecticut issued a series of colonial notes of the following values: 9 pence, 1 shilling, 2 shillings and 6 pence, and 10, 20, 30 and 40 shillings. There were 19 regular issues, the last being dated 1 July 1780. There were also three single bills in the nature of treasury notes, the last dated 26 Jan. 1791. Over 100 different bills were issued by this colony. The smaller values were for 2, 3, 4, 5 and 7 pence, issued 11 Oct. 1777. In Connecticut the 6 shilling bill was not infrequently raised by clever counterfeiters to the value of 10 shillings.

Delaware.—In this colony paper money was issued in 1735. One value only of these notes has been preserved; the denomination is 10 shillings. The designs of the early issues are all about the same, a type body with a border of the same and wood cut of the royal arms. On 28 Feb. 1746 a new series was issued of the same general design, but noteworthy from having been printed by the celebrated Benjamin Franklin and his partner D. Hall. On bills of this colony we first get the information that "To Counterfeit is Death," which is repeated in every possible form. The 2 shilling 6 pence bill of January 1776 issue is adorned with pillars, and probably to show that the edifice supported can stand any sort of usage, one is placed upside down. The last series issued, May 1777, contains bills from 3 pence to 20 shillings, and changed the cut of the royal arms

for that of the State. Sixty bills emitted by this colony are known.

Georgia.—The earliest bill printed in Georgia was of the value of 2 shillings 6 pence and was dated 7 March 1749. The Georgia bills were printed on one side of white paper and were usually made attractive by copper-plate vignettes printed in various colors. The vignettes represented figures of liberty, soldier, deer, hog, rattlesnake, palmetto tree, etc. The last issue was dated 16 Oct. 1786. There are over 110 varieties from 3 pence to £5.

Maryland.—The first bill of this colony is dated 1740 and of the value of one shilling. This was followed by a series of five values in 1748 and from then a regular succession of issues until their final extinction in 1781. The design of the early issues may be described as the arms of Lord Baltimore supported by two men in the costume of the day, one with a fish and the other with a spade. This is differently placed on the various bills. The lettering or form of contract is in the following words, "This indented Bill of Eight Dollars shall entitle the bearer to receive Bills of Exchange payable in London, at the Rate of Four Shillings and Six Pence Sterling per Dollar for the said Bill, according to Directions of an Act of Assembly of Maryland, Dated in Annapolis, this 1st day of January, Anno Domini 1767," followed, of course, by two signatures. The quaint idea of scalloping the end of a legal document to show that it has been prepared with due care and thought and not cut off in a hurry is carried out on these bills. In some values even the word "indented" is printed in a wavy line, and that there should be no mistake as to what is meant by a dollar a minute representation of a Spanish dollar is inserted in the text. The values of the Maryland bills were 3, 4, 6 and 9 pence, and so on up to £3. There were over 100 varieties issued.

Massachusetts.—Prior to 1775, some 13 examples of paper money were issued in this colony. One of these is a copper-plate engraving said to have been the work of the noted patriot, Paul Revere, of Boston. The series was issued by order of the general assembly of the Colony of Massachusetts Bay, 7 Dec. 1775. The reverse of these bills bear the figure of a man in continental dress, with a drawn sword in one hand and a copy of the Magna Charta in the other, above "Issued in defence of American Liberty," below in Latin, "He seeks by the sword calm repose under Freedom." The series of 16 Oct. 1776 repudiates the title of Colony for that of State. Coin must have become scarce, as more than half of the denominations are under one shilling. The codfish was the principal design on these bills. The next issue of eight values was of interest-bearing notes which are guaranteed by the United States. Upward of 135 bills were issued by Massachusetts.

New Hampshire.—The design of the New Hampshire bills was usually the British arms with inscriptions in elaborate frames. The earlier issues were type-set. About 60 varieties are known.

New Jersey.—The issues in this colony began in March 1724 and continued regularly to May 1786. In shape the bills were a small, narrow oblong. The high value notes were printed in blue and red. In 1781 the royal

arms became the arms of the State, the type reading as follows: "State of New Jersey, Five Shillings, This bill shall pass for Five Shillings agreeably to an Act of the Legislature of this State, passed the ninth day of January, One Thousand Seven Hundred and Eighty-one." An entire collection of New Jersey bills would number 185.

New York.—The first bill issued was in 1709, and then followed a series of four dated 18 Dec. 1737. In the next issue the form reads "By a Law of the Colony of New York this Bill Shall Pass current for Three Pounds New York the 20th April 1756." A set of United States guaranteed notes appeared 15 June 1780.

North Carolina.—The earliest notes were dated 1748, and upward of 120 varieties were printed up to 1780. The most of the North Carolina bills bore motto inscriptions such as "Virtuous Councils the Cement of States"; "A Righteous Cause the Protection of Providence"; "A Lesson to arbitrary Kings and wicked Ministers"; "Liberty and Peace the Reward of Virtuous Resistance"; "Persecution the Ruin of Empires"; "Union of Hearts the Strength of Interests"; "American Virtue Triumphant," etc.

Pennsylvania.—The earliest known bill was dated 10 Aug. 1723 and was printed by Benjamin Franklin. The general style of the notes is the same as used in Delaware, bearing the royal arms, or in 1756 those of William Penn, with his motto, "Mercy Justice." In 1764 a curious notion was adopted of spelling the name of the colony differently on each bill, thus on the series we find Pennsylvania, Pensylvania, Pennsilvania and Pensilvania. This was perhaps designed as a protection against counterfeiting. On some of the notes issued in 1771 is the signature of Francis Hopkinson, and on the bills of April of the following year that of John Morton, both signers of the Declaration of Independence. In 1777 the shape of the bill changed to the oblong form, and the arms of Pennsylvania took the place formerly devoted to those of Great Britain. This series are found both in black and red with black type. In 1780 a set guaranteed by the United States, of the same design as issued for other States, was put in circulation, and on 16 March 1785 the last of the series saw the light, the denominations running from 3 pence to £4, 16 values in all. The varieties issued by this colony were over 250. —

Rhode Island.—The paper money of Rhode Island was similar in design and value to that of Connecticut. The first issue was in 1715 and the last in 1786. There were about 75 varieties.

South Carolina.—There were various notes issued in this colony from 1712 to 1770. The bills dated 6 March 1776 were supposed to have the value of silver, equivalent in currency is given thus, 6 Spanish milled dollars = £9 15s currency. In 1779 appeared the handsomest notes heretofore used in the country, the backs of the \$50, \$70 and \$90 bills representing Atlas, Prometheus and Hercules being especially noteworthy. The total number of bills for South Carolina was 105.

Vermont.—In this colony there were but two series, the first issued in February 1781 is an ordinary type-printed note, with engraved border on three sides with the State seal about the centre. This consists of a pair of scales

and a chain of 14 links (the only instance where the number is carried above the original 13) enclosed in a circular band inscribed "Vermont Calls For Justice." The second issue is in the form of treasury notes, the amounts being filled in with ink.

Virginia.—The first issue for this State was in 1755. The notes are of two varieties, the first a fine, large bill after the English style, and then something between a draft and a bank-bill, being probably made to fill a pressing want. The bills are copper-plate engravings filled out in ink. On the issue of 1775 are the royal arms of Virginia in an engraved frame. The lettering reads "Three Pounds Current Money of Virginia Pursuant to Ordinance of Convention Passed 17 July 1775." The following year introduces the "sic semper tyrannis" in place of the arms.

Bank Notes.—From the Revolutionary period to the days of the Civil War and to the present time many issues of paper money have been made by the government and by national, State and local banks. See BANKS AND BANKING.

Confederate Paper Money.—During the Civil War the Southern States in secession issued millions of dollars in paper money, beginning in July 1861, with bills of from \$5 to \$100. On these were designs of the Confederate flag, a train of cars, cotton bales, etc. In September 1861 appeared at least 50 varieties of bills in value from \$5 to \$100. They were of various designs. A \$20 bill showed a head of Alexander H. Stephens in one corner; a \$10 bill pictured General Marion offering a breakfast of sweet potatoes to a British officer. Portraits of Davis, Hunter, Memminger, Stephens, Mrs. Pickens, Mrs. Davis, Benjamin, General Jackson and others appeared on the high value notes. There was an issue of \$1 and \$2 bills in 1862 and in April 1863 appeared a series in value from 50 cents to \$100. Some of these bore designs of the capitol buildings at Richmond, Nashville, Montgomery, etc. The last issue of bills from 50 cents in value to \$500 appeared 17 Feb. 1864. Many of these are still in existence, and in 1917 some one with an accumulation sold them on the streets of downtown New York at five cents a bill.

Postal Currency.—The United States government printed a paper money as a substitute for fractional currency during the Civil War, owing to the scarcity of silver. This was the suggestion of General Spinner, United States Treasurer under Lincoln, and was commonly known as "shin-plaster" money. The issue was in small scrip of the denominations of 3, 5, 10, 25 and 50 cents. It disappeared from general circulation about 1870.

Greenbacks, Silver and Gold Certificates.—The more recent issues of American paper money in circulation at the present day are printed at the Bureau of Engraving and Printing at Washington. The engravers are specialists, and the figures and intricate designs of their work are often marvels of artistic skill. Portraits of living persons are never put on the notes, and all the figures, vignettes, borders, lettering, etc., are engraved separately before they are put on the plates. First the engraver works out his design and after transferring it by hand to a plate of soft steel the plate is hardened and a soft steel roller takes the im-

pression from it. After this roll is chilled another impression is taken on another steel plate and after this latter has been hardened it is ready for use. The geometric lathe which makes the border is a complete and wonderful piece of mechanism. The lines for the borders, backs and other conventional designs seen on the notes are made by this machine. The paper for printing the bank-notes is manufactured under the supervision of government officials. It has various lines of short, uneven colored silk threads running through it.

Foreign Paper Money.—The notes of the Bank of England are five by eight inches in dimensions and are printed in black ink on Irish linen water-lined paper, plain, white with ragged edges. The notes of the Bank of France are made of white water-lined paper, printed in blue and black, with numerous mythological and allegorical pictures. South American currency is about the size and appearance of the American, but is commonly inferior in appearance and easier to counterfeit, being produced by a cheaper lithographic process. The German notes are printed in green and black. The Chinese paper money is in red, white and yellow, with gilt lettering and various devices. Italian notes are printed on white paper in pink, blue and carmine and ornamented with a vignette.

MONEY ORDER SERVICE. See POSTAL MONEY ORDER SERVICE.

MONEYWORT, CREEPING CHARLEY, CREEPING JENNY, or HERB-TWOPENCE, are popular names for *Lysimachia nummularia* of the primrose family. The plant, which is a native of Europe, is a perennial with roundish leaves and axillary flowers borne from early summer until autumn. It is very popular for planting in rookeries, vases, hanging-baskets and shady situations, and has become naturalized in the eastern United States. Propagation by seeds or cuttings is very simple, and the plants seem to thrive in any moist, shaded garden soil, cool greenhouse, or window. Several other plants are sometimes called moneywort; for example, *Anagallis tenella*, *Dioscorea nummularia*, and *Thymus chamædrys*. See LOOSESTRIFE.

MONGE, mōnz, Gaspard, French mathematician and physicist: b. Beaune, France, 10 May 1746; d. Paris, 18 July 1818. He was educated at Beaune and Lyons and at 16 was a teacher. He made rapid progress and some valuable discoveries in engineering, and in 1783 was called to the professorship of hydrodynamics in the Paris Lyceum. He was a supporter of the French Revolution, became Minister of Marine and was temporary Minister of War and one of the signers of the death warrant for Louis XVI. He resigned soon after the king's death and was engaged in manufacturing arms and gunpowder for the army. He founded the Ecole Polytechnique under the Directory and was professor of mathematics there, but was later sent to Italy to assist in the removal to France of the art treasures captured by French

armies, and there gained the friendship of Napoleon whom he accompanied to Egypt in 1798, continuing his scientific researches. He resumed his position in the École Polytechnique upon his return to France and in 1805 was elected senator. Napoleon gave him an estate in Westphalia, and the title of Count of Pelusium, but the downfall of the emperor resulted in reverses for Monge who was expelled from his positions in 1815. He is renowned principally as the founder of descriptive geometry, and one of the earliest scientists in modern geometry. He published *Traité élémentaire de statique* (1788); *Leçons de géométrie descriptive* (1795).

MONGOLIA, a vast tableland region in east central Asia, covering an area of about 1,000,000 square miles, south of Siberia and north of China Proper. Geographically, it comprises former Outer Mongolia, the Gobi Desert (Shamo), and former Inner Mongolia. The Gobi Desert (q.v.), occupying the central portion (nearly a fourth of the entire area), is a sandy plateau with a few spots of pasture and brushwood. The region as a whole is intersected by lofty granite mountain ranges, including the Altai, Tien Shan, Khingan, and Yinshan (Inshan). Only the north has large rivers—the Selenga, the Orkhon, and the Kerulem. The climate presents extremes of intense winter cold and summer heat, and sharp variation between day and night temperatures. The whole population does not exceed 8,000,000. Yet despite its unfavorable climate, the region has been for centuries a strategic trade transit area between China and central Asia, and is now an important link between the Chinese Republic and the Soviet Union. The various nomadic tribes which lived in the northern border regions of China up to the 13th century came to be known collectively as Mongols; but the name Mongol is much older than the time of Genghis Khan (q.v.), under whose leadership the nomads were united to form the first Mongol kingdom. The rise of the Mongol Empire is inseparably associated with his name and that of Timur (q.v.).

Early in the 13th century the Mongols established a world empire which included a great part of Russia, part of eastern Europe, and China. From 1260 to 1368 the Mongols ruled China under what was known as the Yuan dynasty. After the Chinese drove the Mongols back to their homeland, Mongolia came under Chinese suzerainty. The Mongols spread over a number of regions, from what later became the provinces of Kirin and Heilungkiang in the east, to the Ili and Altai regions in Sinkiang in the west, and over all the territory north of the Great Wall and south of Siberia. Their lands became divided into two political units—Inner and Outer Mongolia. Today the former Outer Mongolia is divided into the Mongolian People's Republic and Tanna Tuva or Urianghai, which has become part of the Soviet Union. After the establishment of the Chinese Republic in 1912, Inner Mongolia was divided into four provinces: Jehol, Chahar, Suiyuan, and Ningsia, and the term Inner Mongolia disappeared from the map of China. Following the outbreak of the Chinese-Japanese war the Japanese set up a puppet Inner Mongolian regime in November 1937, which was called the Mongolian Federated Autonomous Government in 1939, with Prince Teh Wang, a lineal descendent of Genghis Khan and leader of

the Young Mongol Movement, as president. Prince Teh Wang's government collapsed immediately after Japan's surrender in August 1945. Subsequently the Chinese National Government and Communists both sought to control the provinces of former Inner Mongolia.

Prior to World War I both Outer and Inner Mongolia were subject to Czarist Russia penetration. Taking advantage of the international situation, the Mongols in Outer Mongolia proclaimed their independence from China when the Chinese overthrew the Manchu dynasty in 1911. As a result of the negotiations between China and Russia and Outer Mongolia, the latter was recognized as autonomous under Chinese suzerainty in 1933. In 1921, after the defeat of a German-led White army which had used Urga (now Ulan Bator Khoto) as its base, a separate government was set up under Soviet auspices. In January 1924 the Soviet Union sent its first diplomatic representative to the Mongolian People's Revolutionary Government. On the death (in July 1924) of the Living Buddha (Hutuktu), the hereditary theocratic ruler, at Urga, the Mongolian People's Republic was proclaimed. In 1936 its representatives and those of the Soviet Union signed a protocol under which the two states pledged mutual military assistance in the event of an attack upon their territories by a third party. An important development since the close of World War II has been the separation from China of the Mongolian People's Republic, which under the name of Outer Mongolia had formerly comprised about one sixth of China's total area. After the Yalta and Potsdam conferences in 1945, at which China was not represented, China and the Soviet Union signed, in conformity with the Yalta decision, a treaty of friendship and alliance whereby China promised to recognize the independence of Outer Mongolia if a plebiscite of the people of that region confirmed this desire. The plebiscite was held in October 1945 and only a few negative votes were registered. In January 1946 China formally recognized the independence of the Mongolian People's Republic. The latter applied in the summer of 1946 for membership in the United Nations. China supported its application but the United States and United Kingdom voted against it. On June 5, 1947 an armed conflict between the Mongolian and Chinese forces took place in Peitashan in Sinkiang, nearly 100 miles from the border. When the Committee on the Admission of the New Members of the United Nations discussed again in the summer of 1947 the application of the Mongolian People's Republic for membership, the Chinese delegation opposed it on the ground that the Mongolian Republic is not a peace-loving state. On the other hand, the Soviet delegation which supported the application stated at the Committee on the Admission of the New Members that it was China who invaded Outer Mongolia in order to divert world attention to her northern border. The application was again rejected.

The Mongolian People's Republic has an area of about 622,744 square miles, with a population (roughly estimated in 1946) of about 1,000,000. The most important resource is livestock. Minerals include coal, antimony, copper, gold, iron, quicksilver, and sulphur. Major exports are livestock, wool, hides, meat, furs, and animal hair; major imports are flour, petroleum, metal goods, tobacco, cotton goods, and tea. Trade re-

lations of the Mongolian People's Republic are largely with the USSR.

HUNG-TI CHU

Former Head of Information and Research Department, Chinese News Service, New York City

MONGOLS, a general name originally applied to the different nomadic tribes which lived in the northern border regions of China. According to some historians, the name Mongol was derived from the Chinese word *Mong* meaning brave. It was believed to have been given to the tribes under the control of Genghis Khan. Under his leadership they were united and formed the first Mongol kingdom. However, because of the unparalleled Mongol conquest under Genghis Khan and Kublai Khan, the name has been liberally but inaccurately applied to a majority of the people of Asia. This is also due to the classification of human races by Johann Fredrick Blumenbach, the German scientist and the founder of modern anthropology, who on the basis of the distinction of color, hair, and descriptive features of skull and face, first distinguished about a century ago five races of man: Mongolian, Caucasian, Ethiopian, Malayan, and American. Therefore, it is traditionally maintained that the physical features of the Mongolian race are distinctive. The head of the Mongolian is square; the face flattish, nearly as broad as long; the parts not well distinguished from each other; the eyelids narrow, obliquely turned up at their outer angle; the space between the eyes flat and broad, the nose flat, the cheeks projecting, the chin somewhat prominent. The hair is straight, the color black, that of the face and body yellowish (sometimes inaccurately called olive, which implies an admixture of green).

The Mongols have their own language, which is classified as one of the Altaic languages. Generally speaking there are three Mongol dialects and they differ only slightly. Roughly these dialects correspond to the geographic distribution of the Mongols in the three regions: the Northeastern Mongols (Khalkhas), the Western Mongols (Kalmuls), and the Central Mongols (Buriats). As the large part of Mongolia lies in the Gobi and the rest of it is made up of barrier mountains to the north and west and since the majority of the Mongols are wandering nomads, the Mongol literature is comparatively undeveloped. Truly native literature is in the colloquial. During the Mongol rule of China the Chinese language incorporated many Mongolian vocabularies, and when the whole of Mongolia was a part of China under the Manchus the Chinese language was used as an official language in Mongolia. Since the declaration of the independence of Outer Mongolia many Mongols have learned the Russian language.

The prevailing religion of the Mongolian region, aside from the sects of the immigrant Chinese, Japanese and Russians, is Lamaist Buddhism, closely resembling that of Tibet. Lamaism developed originally from Indian Buddhism, and was introduced to the Mongols when they still ruled in China. Lamaist Buddhism, which dominated the thinking and life of the Mongols, is declining. The castes in Lamaism are divided into: (1) Fuyeh Lama, the head of all the Lama monasteries, generally known as the living Buddha; (2) Jassab, the religious and political head of a district; (3) Da Lama, the head of a

temple or monastery; (4) Miu Lama, an ordinary Lama; (5) Hue, widows and widowers before they become Lama. Generally there are ten Lama monasteries in every banner.

The Mongols had traditionally been divided into many units called banners, and these are grouped into tribal leagues, chief of which are: (1) the Khalkhas, the Mongolians proper; (2) the Ordos, and (3) the Tsaktar, both of Mongolian blood; and (4) the Ouryanti and Darkhat, who are Mongolized Turks. The basic unit of a banner was the *bak*, ruled by an elected elder, and a number of *baks* were united under an hereditary prince in a banner, several banners forming a confederacy or league under an hereditary princely house, or occasionally in more recent times, under an elected prince. In 1933 various Mongolian leagues in Inner Mongolia petitioned for the right of self-government and since then they have been directly under the control of the Executive Yuan of the Chinese National Government instead of the provincial governments. The impact of Soviet influence in Outer Mongolia, of Japanese penetration in Eastern Inner Mongolia before and during the Chinese-Japanese War of 1937-1945, and of Chinese cultural influence in the Mongol region, has shaken the foundations of the Mongol social system.

The main population element in former Outer Mongolia (now the Mongolian People's Republic) is the Khalkhas, who have had less contact with the Chinese than the other Mongols, and remain the core of the Mongol people. The Khalkhas are largely nomadic, periodically shifting their quarters in search of new pastures for their cattle, camels, horses, and sheep. They live under the *vourte* (yurt), a tent dwelling with a domed top, consisting of a light circular framework covered with pieces of felt, which stands about 10 feet high. The fireplace is situated in the center, the household gods being placed usually opposite the door, and the housekeeping utensils along the walls. Around the fireplace are spread pieces of felt, for which the well-to-do substitute carpets. The princely *yourtes* are furnished with board floors and are decorated with silken hangings. Since the Soviet influence extended to Outer Mongolia, the nomadic life of the Mongols there has been diminishing.

MONGOOSE, an ichneumon (*Herpestes griseus*), common in many parts of India, and closely akin to the Egyptian species ichneumon (q.v.). The mongoose is a burrowing, nocturnal, weasel-like animal, tawny yellowish-gray, 16 or 17 inches long, and with a long thick terete tail. It kills numerous birds, sucking their blood and leaving the body uneaten. It also with great adroitness seizes and kills many snakes, the formidable cobra included, usually avoiding the serpent's stroke by its quickness. Its excitement and ferocity in these encounters is almost indescribable. Mongooses have been imported into many regions where the climate is suitable, in America notably in the Antilles, for the purpose of exterminating poisonous snakes.

MONICA, Saint, mother of Saint Augustine (q.v.): b. Africa 332; d. Ostia 387. A Christian who, in accordance with the wishes of her parents, also Christians, married a pagan. She devoted nearly all her life to the conversion of her husband and son Augustine. Her self-

sacrifice was at last rewarded; her husband, Patricius, became a Christian, and Augustine, seeing the error of his ways, reformed. After the baptism of Saint Augustine at Easter, 387, she set out with her two sons for Africa. Arriving at Ostia she became ill and here died. A friend asked her in Ostia if she were not afraid to be buried in a place so far from her own country. She replied: "Nothing is far from God." Her eminent son preserved many of her holy sayings which he often repeated in his sermons. In the Roman Catholic Church she is regarded as the model and patroness of wives and mothers. Her feast is 4 May. In 1430 her relics were brought to Rome, and were later deposited in the Church of Saint Augustine. Consult 'Saint Augustine's Works' edited by Tillemont; Butler, 'Lives of the Saints.'

MONIER-WILLIAMS, Sir Monier, English Sanskrit scholar: b. Bombay, 12 Nov. 1819; d. Cannes, France, 11 April 1899. He was a son of Monier-Williams, surveyor-general. He was educated at Oxford, and was for a short period a student at the East India College, Haileybury. He was professor of Sanskrit at Haileybury from 1844 to the extinction of the college in 1858, and in 1860 became Boden Sanskrit professor at Oxford, a post which he held till his death. Among his numerous works are 'Practical Sanskrit Grammar' (1846); 'English-Sanskrit Dictionary' (1851); edition with notes, translations, etc., of the *Sakuntalā* (1853); 'Introduction to Hindustani' (1858); 'Indian Epic Poetry' (1863); 'Sanskrit-English Dictionary' (1872; 2d edition 1899); 'Indian Wisdom' (1875); 'Hinduism' (1877); 'Modern India and the Indians' (1878); 'Religious Life and Thought in India' (1883); 'The Holy Bible and the Sacred Books of the East' (1886); 'Brahmanism and Hinduism' (1889); 'Reminiscences of old Haileybury College' (1894). He traveled extensively throughout India in order to study the native religions, and to further his scheme of an Indian institute, which he succeeded in getting established at Oxford.

MONISM, a philosophical term which may be briefly translated by "doctrine of unity." The word was coined by Christian von Wolff, a German philosopher of the first half of the 18th century, and is derived from the Greek monos which means "single; alone; lonely; unique; existing in only one copy." Wolff, the inventor of many happy terms that acquired currency in philosophy, introduced the word to characterize such philosophies as recognized the

existence of one ultimate form of reality only, be it spirit or matter, and he contrasted it with "dualism," that is, doctrine of duality, held by all those thinkers who believe that both spirit and matter are ultimate forms of existence. Monism is also opposed to a view like that of Leibnitz, which maintains the existence of many substances; the latter is called pluralistic. The word "monism" has come to be applied to views maintaining a unity of a non-substantial nature. It has been adopted as the label of a certain type of positivistic theory that emphasizes the oneness of things. (See DUALISM and PLURALISM). Consult Haeckel, E. H., 'Riddle of the Universe' (New York 1900); Walker, W. L., 'Christian Theism and Spiritual Monism' (New York 1906); Worsley, A., 'Concepts of Monism' (London 1907). Discussions of monism will also be found in any of the numerous introductions to metaphysics.

MONITEUR, mō-nē-tēr, Le, French journal, established 5 May 1789 by Panckoucke under the name *Gazette Nationale, ou le Moniteur Universel*. Under the title of *L'Ancien Moniteur* the issues for 1789-99 were published in 32 volumes by Gallois (Paris 1840-45). In 1800 the *Moniteur* published the official Actes du government. The name in 1811 was changed to *Moniteur Universel*. Four years later the government publications were omitted from the paper and printed separately in the *Journal Officiel*. Its policy again changed and it continued as the government organ until 1868, when the *Journal Officiel* was again published separately.

MONITITE. See MONETITE.

MONITOR, The, an ironclad, the first of a class of naval vessels designated as monitors (see WARSHIPS). It was designed and built for the United States government in 1861-62 under direction of the engineer John Ericsson (q.v.), who adopted as the most essential feature of its construction the revolving gun-turret devised by the American inventor, Theodore Ruggles Timby (q.v.). The *Monitor* was launched at Greenpoint, L. I., 30 Jan. 1862, only 100 days after the laying of her keel. She put to sea 6 March following, under command of Lieut. John L. Worden (q.v.), arriving on the night of the 8th at Hampton Roads, Va. Extraordinary energy had been displayed by the builders to meet a grave emergency of the government, then weak in naval resources, for making effectual the blockade of Southern ports

Theodore R. Timby's Model sent to China by Caleb Cushing in 1843, which suggested to J. Ericsson the Low Freeboard.

which President Lincoln had proclaimed, as well as for aggressive action and coast-defense. This emergency soon became a dire peril which threatened the destruction of the Union through superior sea power acquired by the Confederacy with foreign aid or connivance. How this danger was first averted is shown in the account of the famous action in Hampton Roads (see MONITOR AND MERRIMAC).

The *Monitor* was built by a company of men, John F. Winslow and John A. Griswold of Troy, N. Y., and their associates, who were actuated by patriotic motives. With T. R. Timby, who had taken out patents "for revolving towers for offensive or defensive warfare whether placed on land or water," they entered into a contract for the use of his inventions covering the revolving turret, paying him \$5,000 as royalty on each turret constructed by them. They built the *Monitor* at their own risk, Winslow and Griswold furnishing 90 per cent and S. Bushnell of New Haven, Conn., 10 per cent of the cost. Ericsson, for his services as engineer, received 5 per cent of the gross sum paid to the company for the *Monitor* and kindred vessels built by them. A contract with the government was made by the company and Ericsson, and the government paid for the *Monitor* \$275,000, the actual cost being \$195,000.

Ivory model of the turret made by T. R. Timby in 1841; now in possession of the Patriotic League of the Revolution.

The contract with the government provided for the building of "an iron-clad, shot-proof steam battery of iron and wood combined," and the hull of the *Monitor* was of iron with wooden deck beams and side-projection. Her dimensions were:

Extreme length.....	172 ft.
Extreme breadth.....	41 ft. 6 in.
Depth of hold.....	11 ft. 4 in.
Draft.....	10 ft. 6 in.
Inside diameter of turret.....	20 ft.
Height of turret.....	9 ft.
Thickness of turret.....	8 in.
Thickness of side armor.....	5 in.
Thickness of deck-plating.....	1 in.
Diameter of propeller.....	9 ft.
Diameter of steam cylinders (two).....	36 in.
Length of stroke.....	2 ft. 2 in.
Displacement.....	1,255 tons
Armament, two 11-in. shell-guns, each 15,668 pounds.	

In all the models, drawings and plans of his invention made by T. R. Timby himself, the pilot-house or "lookout" was placed on top of the turret. "For some inexplicable reason," he has said, "the *Monitor* had her pilot-house placed upon the deck, forward of the turret, in the way of her own guns."

The success of the *Monitor* aroused much interest in all maritime nations, and was the direct cause of many modifications in the construction of vessels in the navies of Europe,

though nowhere except in the United States navy was the monitor adopted as a distinct type of warship. During a gale off Cape Hatteras, 31 Dec. 1862, the *Monitor* was sunk.

JOHN H. CLIFFORD.

MONITOR LIZARD, the type of a family of pleurodont lizards (*Varanidae*). They are found in Africa, the Eastern Archipelago, etc., and are the largest of modern lizards, some species attaining a length of six or eight feet. The skin is covered with very small juxtaposed scales and tubercles dorsally, while ventrally the scales are square and arranged transversely. The tail is long, cylindrical in the terrestrial, but compressed laterally in the aquatic forms, and possesses a sharp underridge or keel. The limbs are well developed and the toes provided with claws. Most of these great greenish-gray lizards inhabit rivers and ponds, and are active and fierce enemies of all lesser aquatic life. They feed upon eggs and young of crocodiles, turtles and aquatic birds; and on fishes, amphibians, swimming-birds, anything in fact, small enough to be mastered. There is one genus and nearly 30 species. The most familiar species, probably, is that of the Nile and other African rivers (*Varanus niloticus*), upon which the English name "monitor" was first fastened by a ridiculous misinterpretation of the Arabic word *ouaran* (lizard); it is aquatic and frequently exceeding five feet in length. An equally well known kind is the East Indian monitor (*V. salvator*), which is to be met with from Ceylon and western India to the Philippines, and is equally at home in the water, on land or in trees. Its rapacity is great and varied; and it is connected with many extraordinary rites and superstitions among the natives, some of which are given in Fennell's "Sketches of the Natural History of Ceylon" (1861). Australia has a large species (*V. gouldi*).

MONITOR AND MERRIMAC. The contract for the construction of the *Monitor* was entered into by the Navy Department in the hope that she could be completed before the *Merrimac*, then building by the Confederates at the Norfolk navy yard, could be finished, and that the *Monitor* would be able to cope with this formidable ironclad. The *Merrimac*, called by the Confederates the *Virginia*, was being reconstructed upon the hull of the United States frigate *Merrimac*, of 3,200 tons, which had been sunk, when the Norfolk navy yard was abandoned, by the Union forces, and was subsequently raised by the Confederates. Her armament was two 7-inch rifles, two 6-inch rifles and six 9-inch smooth-bores.

Each side was aware of the effort of the other to be first ready for active service. The Confederates won by a day. At noon 8 March 1862, the *Merrimac*, attended by two gunboats, *Raleigh* and *Beaufort*, each one gun, was discovered coming out of the Elizabeth River into Hampton Roads (q.v.) and standing toward the Union fleet off Newport News and Fort Monroe, composed of the steam-frigates *Minnesota*, *Roanoke* and *Congress*, each 50 guns; the sailing-frigate *Saint Lawrence*, 12 guns, and the sloop *Cumberland*, 24 guns. Their armament was mainly 8-inch and 9-inch guns, with several 10-inch pivot guns. These vessels had the

heaviest batteries which the government had been able to assemble to watch the *Merrimac*. The latter bore down directly upon the *Congress* and *Cumberland*. At less than a quarter of a mile the *Congress* delivered her broadside, her heaviest shot making no impression. The return-fire of shells crashed through her sides with terrible effect. Passing the *Congress* at 300 yards, the *Merrimac* received the fire of the heaviest guns of the *Cumberland* without the slightest harm resulting, and without replying she drove her iron prow through the side of the Union frigate, crushing it, and at the same time pouring in a fire of shells. Leaving the *Cumberland* rapidly sinking, the ironclad steered for the *Congress*, which had been run ashore, and from a point 150 yards astern raked her decks with shells which caused general destruction and set the ship afire. The *Congress* was obliged to surrender. The *Cumberland* fired a broadside as the water reached the gun-deck, and went down with her flag flying. As she sank, the Confederate steamers *Patrick Henry*, 12 guns, and the *Jamestown*, two, came out of the James River and joined the *Merrimac*. The *Minnesota* had grounded where the *Merrimac* could not approach within a mile, and her firing was so bad that only one shot struck the frigate. The other Confederate vessels were finally driven off after inflicting much damage with their rifled guns. After several hours' ineffectual attempts to reach the *Minnesota*, the *Merrimac* and attending gunboats returned to Norfolk. Several shore-batteries which had attempted to help proved as useless as the batteries of the frigates had been. The *Congress* continued to burn, and finally blew up. Over half the crew of the *Cumberland* were lost. The crew of the *Congress* were made prisoners, but, with the exception of the officers, were released. The total loss was some 250, the Confederate loss was nominal. The battle of an afternoon had ended the day of wooden navies.

The reports of the destruction by the *Merrimac* caused consternation at Washington, and in the coast cities and, indeed, throughout the North. Secretary Stanton ordered all preparations made for obstructing the channel of the Potomac far below the capital, and warned those in charge of coast-defenses to use every means that could be devised for protection.

Meantime the *Monitor*, in command of Lieut. John L. Worden, had left New York and after a rough voyage entered Hampton Roads at 9 o'clock the night after the battle. At 2 o'clock on the morning of the 9th she had anchored alongside the *Minnesota*. At 6 o'clock the *Merrimac* appeared bearing down on them, but at first passed by, gained the channel in which the *Minnesota* lay, and then steamed directly toward her. The *Monitor* swept in between the two and steered for the *Merrimac*. At close quarters the latter brought her bow-guns to bear and missed. There was little to fire at except the low turret with a cross-section of 20 feet. The first reply of the *Monitor* was a solid 11-inch shot which shook the *Merrimac* from stem to stern. The answer was a broadside, some of the shot of which struck the turret, either glancing or falling as harmless as the shot of the frigates the day before had proved against the *Merrimac*. Then followed broadside after broadside without producing the

slightest effect on this "cheese-box on a raft," as spectators described it. At every opportunity of maneuver the *Monitor* closed in and smote with her 11-inch solid shot, bending the heavy armor and straining the timbers of her adversary. Finally the *Merrimac* left the *Monitor* and crowded steam for the *Minnesota*. Upon reaching point-blank range she received broadside, and a shot from a 10-inch pivot gun, without suffering the slightest damage. In reply she raked the *Minnesota* with a shell, set her afire, blew up a tug alongside and but for the *Monitor*, which had followed under full steam, and now swept in between the two, the *Minnesota* would have shared the fate of the *Congress* and *Cumberland*. In changing position to meet the *Monitor* the *Merrimac* grounded, and the *Monitor* continued her hammering with 11-inch shot. As soon as the *Merrimac* was floated she started rapidly down the bay, pursued by the *Monitor*. Suddenly she turned and attempted to run the *Monitor* down. The blow she struck with her prow glanced, and the *Monitor* was unharmed. The *Merrimac* then started for the *Minnesota* for the purpose of ramming her; but when within ear range the *Merrimac*, with all the Confederate ships, changed course at noon headed for Norfolk. Her officers subsequently gave as reason that in attempting to ram the *Monitor* her iron prow was broken, and their vessel was leaking. The armor was reported damaged, the stem twisted, the muzzles of two guns shot away and the steam-pipe and smoke-stack riddled. The casualties were only two killed and 19 wounded. The consternation of the day before at Washington and the North was transferred to Richmond and the South. Preparations were hastily made by the Confederates for blocking the channels in the Elizabeth and Nansemond rivers, and to obstruct the channel of the James.

The *Merrimac* did not again engage the *Monitor*, and after the evacuation of Norfolk which occurred 9 May, she was destroyed by the Confederates.

The *Monitor* had hurried direct from the shipyard to Fort Monroe and fought without previous trial-trip, and before she had been accepted by the government. Her five-hour battle settled many questions, and once again American history had been fired a "shot heard round the world."

MONITORIAL SYSTEM. See LANCASTERIAN SCHOOLS.

MONK, mŭnk, or MONCK, George, DUKE OF ALBEMARLE, English general and naval commander; the restorer of the Stuart dynasty; b. Potheridge, Devon, 6 Dec. 1608; d. Newnham, Essex, 3 Jan. 1670. At 17 he enlisted and served in the Cadiz expedition under Sir Richard Grenville, a relative; then entered the Dutch army; and returned to England in 1626 fought brilliantly in Scotland and after in Ireland, and on the outbreak of the Civil War kept his commission in the king's army. But in 1644 he was captured by the Parliamentarian forces, and after two years' imprisonment in the Tower, joined the victors, for whom he went to Ulster as governor. Accused of exceeding his powers by arranging a truce (which was almost an alliance) with Owen O'Neill, he was recalled to England in 1649 and reprimanded.

landed at the bar of the House of Commons. At the victory of Dunbar in 1650 he did good service; a year later he was made lieutenant-general of ordinance and in Cromwell's absence was commander-in-chief of Scotland. In 1652 he was made a general of the fleet. He introduced the elements of land tactics into naval formation and administered two crushing defeats to the Dutch, Maarten Tromp being killed in the latter battle. In 1654 he again was sent to Scotland on the Royalist rising as commander of the army, and acted there with much more prudence and success. After Oliver's death and Richard Cromwell's resignation Monk set himself to effect the Stuart Restoration, quietly shifted the forces in England until all was so arranged that there was no chance of armed resistance, and then (1660) brought back Charles II—a bloodless revolution meeting with general favor. He was made Duke of Albemarle, received other high honors, maintained order and showed rare courage in London during the Plague, but with an empty treasury in 1667 could not keep the Dutch from burning the shipping in the Thames. Short, fat, fair and wrinkled, Monk was not a winning personality, being cold, prudent past a virtue and rather unprincipled; but he was a wonderfully able general, with technical skill rare in one so lacking in theoretical training. His life was written by his chaplain, Dr. Thomas Gumble (1671).

MONK. See MONASTICISM.

MONK SEAL, a seal of the genus *Monachus*, the species properly so called is that (*M. monachus*) of the Mediterranean; but the West Indian seal (*M. tropicalis*) is very similar to it.

MONKBIRD. See FRIAR-BIRD.

MONKEY BREAD, the fruit of the baobab tree (q.v.).

MONKEY FLOWER, any of many plants of the genus *Mimulus* (figwort family), so called because the face of the fox-glove-like corolla suggests that of a cheerful monkey. They are erect, tall herbs, with opposite, clasping, lanceolate dentate leaves, which bear in late summer solitary, axillary irregular blossoms of showy colors. The genus contains some 50 North American species, of which the most familiar is the square-stemmed of the Eastern and Central states (*M. ringens*). Its flower is violet. A common species in California and on the Pacific Coast (*M. guttatus*) has the corolla yellow, often blotched with red or purple.

MONKEYPOT, the fruit of a forest tree of the genus *Lecythis* of Brazil and British Guiana. See BRAZIL NUT; SAPUCAIA NUT.

MONKEYS comprise all the tailed members of the Anthropoidea. Perhaps it should be stated that the Anthropoidea, as a great suborder of the order Primates, is much more inclusive than the term "anthropoid apes," or the family Pongidae, as it includes all monkeys, apes and also man. It might be supposed that the monkeys could form a unified natural group; but such is not the case. The American or New World monkeys and the Old World forms constitute two separate groups, with many significant differences which are obscured by more obvious gen-

eral likenesses of less diagnostic importance. The Old World monkeys are actually closer zoologically to the great apes and even to man, than they are to the American monkeys. As early as 1820, American monkeys were designated as *Platyrrhina* (flat nosed), in reference to the fact that their nostrils are widely separated and open laterally, while in all Old World monkeys, as in apes and man, the nostrils are closely approximated and are directed downward; hence all these forms were grouped as *Catarrhina* (downward nose). The terms *platyrrhine* and *catarrhine* are still in common use, but usually as descriptive terms rather than as taxonomic group names. Today all *platyrrhine* monkeys are grouped as a superfamily *Cebioidea*, while all Old World *catarrhine* monkeys are placed in the superfamily *Cercopithecoidea*. To mention a few of the features common to the two superfamilies, attention may be called to the general humanlike appearance, especially of the face, which everyone must have noticed; also the use of the hands and the habit, in most monkeys, of sitting erect; also their alertness and apparent intelligence. It may also be noted that nearly all monkeys are adapted to arboreal life. The fore and hind limbs are not greatly unequal in length. The fore feet are obviously "hands" in structure, with a more or less well-formed thumb or pollex. The pollex is reduced or lost in a few cases to be mentioned below. The hind feet have a widely divergent great toe, or hallux, which, in most cases, is capable of opposing the other toes to form a grasping foot which is functionally almost a hand, and of great service in grasping branches of trees. As this type of foot characterizes not only the monkeys, but practically all members of the order Primates except man, the nonhuman forms were grouped by Johann Friedrich Blumenbach in 1791 as *Quadrumania* (four-handed), while man was made the sole representative of the *Bimana* (two-handed). But any likeness of a monkey's grasping hind foot to a hand is functional, not structural, and "*Quadrumania*" and "*Bimana*" have long been obsolete in zoological literature. Other common features of both groups of monkeys are a single pair of mammary glands located on the thorax, a tail, often long, sometimes short, and entirely lacking in one species. There are always four incisor teeth in both upper and lower jaws, and the canines are frequently of great length, especially in the males, and, except in one family (Marmosets), there are three molars in each half of both jaws. The eyes are directed forward so that monkeys, like apes and man, have binocular vision, and careful studies of the visual mechanism and behavioral experiments on living monkeys have shown that they have true stereoscopic vision and color perception, which are lacking in other mammalian orders. The brain is surprisingly similar in both groups of monkeys. Formerly it was believed that the Old World forms were superior in intelligence to their American relatives, but experimental laboratory studies have shown the American *Cebus* monkey to be able to solve problems which were previously believed to be beyond the mental capacity of any animal below the manlike apes.

To contrast some of the features in which the two groups differ: in the *Cebioidea*, including the two families, *Cebidae*, the "typical" American monkeys, and the *Callithricidae* (*Hapalidae*) or the marmosets and tamarins, there are three pre-

molar teeth, while the superfamily Cercopithecoidea have only two. The American forms have no bony auditory meatus to the tympanic bone, while Old World monkeys have. The number of chromosomes in the cells in the two groups is also different, though it must be admitted that they have been counted in very few genera. In the rhesus monkey of India the diploid number was found to be 48 as in the chimpanzee and in man, whereas in an American Cebus it was 54. In their blood chemistry also the Old World monkeys are closer to apes and man. Old World monkeys are also essentially similar to apes and man in the menstrual function of the females. This has been studied with great care in the rhesus monkey. In the Ceboidea menstruation is usually considered to be absent, though something of the sort has been asserted to occur in some cases. Thus in all the comparisons here cited it is seen that the Asian and African monkeys have a closer likeness to the superfamily Hominoidea than to Ceboidea.

To consider first the family Cebidae, which include all American monkeys except the marmosets, they inhabit the tropical forest regions of South and Central America, and some extend into southern Mexico. Many of them spend their entire lives in the trees. In none of them is the pollex, or thumb, actually opposable to the other fingers. Some of the smaller Cebidae, such as the titis, the sakis, and night monkeys which have nonprehensile tails, feed largely on insects, birds' eggs, and small birds, in addition to fruit. The night monkeys are the only thoroughly nocturnal monkeys. The best known genus is *Cebus*, formerly familiar as the companion of itinerant organ grinders. Its tail is somewhat prehensile, though far less so than in the large howling monkeys, woolly monkeys, and spider monkeys, in which the tail is often compared functionally to an extra hand. The spider monkeys have lost the thumb. The howlers have a remarkable expansion of the hyoid bone and the thyroid cartilage of the larynx, which function as a resonance apparatus for the animal's vocalization. The diminutive marmosets and tamarins of the family Callithricidae (= Hapalidae), have sharp curved claws on all the digits except the hallux, which bears a flat nail. See also MARMOSET.

The superfamily Cercopithecoidea, the Old World monkeys, are in general larger than the Ceboidea. They are widely distributed in Asia, Africa, and the Malay Archipelago. Most of them have cheek pouches for temporary storage of food, and all have ischial callosities or seat pads on the buttocks. The tail is never prehensile. The baboons are large ground-living monkeys with elongate doglike heads, inhabiting Africa and Arabia. The Colobidae, a family represented by the langurs of Asia and the Malay Archipelago, and the guerezas of Africa, lack the cheek pouches and have sacculated stomachs, which apparently represent adaptations to leaf-eating habit. In the guerezas the thumb is reduced to a small vestige or absent entirely, thus paralleling the condition in the American spider monkeys. Noteworthy examples of the langur group are the snubnosed monkeys of northwestern China and Tibet, but the most remarkable of all is the large proboscis monkey (*Nasalis larvatus*) of Borneo, in which the nose, in adult males, attains grotesque proportions and hangs down over the mouth. The color of the face,

including the proboscis, is a reddish brown flecked with white.

Fossil material of monkeys is sparse and fragmentary, but there is strong reason to believe that the American and Old World groups evolved separately from tarsoid ancestors in the Eocene or Paleocene time, and that the striking similarities in the two groups of monkeys represent parallel evolution. In America the oldest fossil monkeys are from the Miocene of Argentina, too late to throw light on origins, and in 1949 others were found in Colombia. In Egypt fragments of jaws and teeth from the Lower Oligocene seem to indicate that both Cercopithecoidea monkeys and small anthropoid apes flourished at that time. See also BABOON; PRIMATE.

Consult Elliot, D. G., *A Review of the Primates* (New York 1913); Zuckerman, S., *The Social Life of Monkeys and Apes* (New York 1932); Boulenger, E. G., *Apes and Monkeys* (New York 1937).

JAMES H. MCGREGOR,
Professor Emeritus, Department of Zoology, Columbia University.

MONKFISH, or **ANGELFISH**, a broad flattened fish (*Squatina angelus*), closely allied to the sharks, but more like a ray in appearance, five or six feet long, having enlarged, wing-like pectoral fins which are separated from the head by a notch. It is found near the coast in the warm seas of Europe and North America, usually stays near the bottom, is slow in motion, dull, voracious and useless, except that some shagreen may be obtained from its skin.

MONKHOUSE, mŭngk'hous, William Cosmo, English author, poet and art critic; b. London, March 18, 1840; d. Skegness, Lincolnshire, England, July 2, 1901. He received his education at St. Paul's School in London and in 1857 became a junior clerk in the Board of Trade office with which he was connected with advancement for the remainder of his life. Although not a great poet his work enjoys a high reputation among the works of the minor poets and as an art critic he won considerable attention. His work for the *Dictionary of National Biography* taken within its scope practically all of British art. He published *A Question of Honor*, novel (1868); *The Works of John Henry Foley* (1875); *The Italian Pre-Raphaelites* (1887); *British Contemporary Artists* (1899), etc. Among his poetical works are *A Dream of Idleness* (1865); *Corn and Poppies* (1890); *The Christ upon the Hill* (1898); and *Passions of the Elder*, published after his death.

MONKSHOOD. See ACONITE.

MONLUC, mŏn-lŭk', or **MONTLUC** SEIGNEUR de (BLAISE DE LASSERAN-MASSEN COME), French marshal and military writer; b. Sainte Gemme, near Auch, 1501?; d. Estillac, near Agen, July 1577. He entered the army as an archer, fought (1525) at Pavia, accompanied the campaign of Francis I against Charles V and aided much in the outcome by improvements in tactics and in the artillery and engineering. His defense of Siena (1555) was brilliant, but he became hated, as governor of Guienne, for his severity against the Protestants. He was first to recommend the introduction of caring for the wounded and the testing of officers. His *Commentaires*, which takes in from 1521 to 1577

and Henry IV, and often called the "Soldier's Bible" have considerable value in the history of warfare. The standard edition of the *Commentaries* (*Commentaries de Messire Blaise de Montluc*) is that of the Société de l'Histoire de France, edited by A. de Ruble, 5 vols., and published in 1865-1872; another edition, with critical comments, was published by P. Courteault in 1911-1914. Both editions were published in Paris.

Consult Courteault, P., *Blaise de Montluc, historien* (Paris 1908); de Broqua, J. J., *Le Maréchal de Montluc, sa famille et son temps* (Paris 1924).

MONMOUTH, mön'müth, DUKE OF (JAMES SCOTT), royal pretender and claimant to the English throne: b. Rotterdam, Holland, April 9, 1649; London, England, July 25, 1685. He was the natural son of Charles II and Lucy Walters, as seems certain from the king's open recognition of him, although he so closely resembled Robert Sidney, whose mistress his mother had been, that Sidney has been supposed his father. Placed under the guardianship of Lord Crofts, he assumed the name of James Crofts and was brought up in France under the care of Henrietta Maria, the queen dowager. He was recognized and summoned to England by his father after the Restoration, married to Anne Scott, heiress of Buccleuch, and made duke of Monmouth; and served in Holland in 1673.

His Protestant sympathies, his clemency to the Scottish covenanters whom he defeated at Bothwell Bridge (1679), and a story persistently circulated (and denied before Privy Council by the king) that Charles had secretly married his mother in Holland, made him popular with the Protestant party; and Lord Anthony Shaftesbury repeatedly urged the king to legitimize him and insure a peaceable Protestant succession.

After the Rye House Plot he escaped to Holland. Thence after the accession of James II he invaded England, possibly with the complicity of William of Orange, called the people to arms, raised a large force of Protestants, was proclaimed king at Taunton, but was defeated by the earl of Feversham (Louis Duras or Durfort) at Sedgemoor. Taken prisoner he begged for his life from the king to no purpose, and was executed at the age of 36. He was handsome, weak, fickle, and in his claims to the throne no doubt entirely under the control of political plotters. See the diaries of John Evelyn and of Samuel Pepys for the setting of Monmouth's career. Consult Roberts, G., *Life of Monmouth* (London 1844); and Fea, A., *King of Monmouth* (New York 1902). The latter work outlines the popular legend that Monmouth was not executed, a substitute having taken his place, and tells how the country people long expected his return.

Consult article in *Dictionary of National Biography*, "Scott, James," vol. 17 (London 1937-38).

MONMOUTH, city, Illinois, and Warren county seat; altitude 762 feet; 14 miles west-southwest of Galesburg; 27 miles east of Burlington, Iowa. It is served by the Burlington; Rock and Southern; and Minneapolis and St. Louis roads, and has an airport. The surrounding country is principally agricultural, specializing in cultivation of soybeans and grain, dairying and livestock. There are coal mines and deposits of clay nearby. The city's industrial products are pottery, sheet metal specialties, farm machinery, and furnaces. The county maintains its library, and Monmouth is the seat of Monmouth

College. First settled in 1831, Monmouth was incorporated as a town in 1836, and in 1852 as a city. It has mayor and council government. Pop. (1940) 9,096; (1950) 10,193.

MONMOUTH, Battle of, in American history, a celebrated engagement between the American and British forces, the former commanded by General Washington and the latter by Sir Henry Clinton, which took place at Freehold, Monmouth County, N. J., June 28, 1778. On June 18 Sir Henry Clinton, acting under peremptory orders from the British Ministry, evacuated Philadelphia, which had been occupied by his army since the preceding September, and proceeded across New Jersey toward Brunswick, with a view of embarking on the Raritan. On hearing of this movement, Washington broke up his camp at Valley Forge, and having sent forward some light troops to harass the enemy started in pursuit. Excessive heat slowed the march of both armies.

At Allentown, Clinton turned to the right by a road leading through Freehold to Sandy Hook, to embark at the latter place; and Washington, who had hitherto been deterred by the advice of his officers, and particularly of Gen. Charles Lee, from attacking the enemy, determined at once to give him battle. The evening of the 27th found the main body of the enemy encamped on high ground near Monmouth courthouse, while the American advance, about 4,000 strong, under Lee, was posted at Englishtown, five miles distant, with the main body about three miles in the rear.

The command of the advance had originally been given to General Lafayette, with the consent of Lee; but the latter subsequently applied for and obtained it. Early on the 28th Lee engaged the rear division of the enemy, his orders being to hold it in check until the main body under Washington could come up. The Americans were at first successful, but owing to causes which have never been satisfactorily explained, the whole body soon after fell into a confusion and commenced a disorderly retreat, closely followed by the British. Washington, who was advancing hastily with the main body, received the first intimation of this movement in the crowds of fugitives who poured along the road. Exasperated at the failure of Lee to execute his orders he rode up to that general and reprimanded him. Then he re-formed them, and hastened back to bring up the main body. Lee, resuming his command, held his position with spirit until compelled to retire and brought off his troops in good order. The main body, which had meanwhile taken a favorable position on an eminence, with a morass in front and a wood in the rear, opened an effective cannonade upon the British. The latter, after an ineffectual attempt to turn the American left under Lord William (Alexander) Stirling, directed their chief efforts against the right commanded by Nathanael Greene, where Anthony Wayne, under cover of an orchard, was harassing their center by a severe fire. To dislodge him Colonel Moncton advanced with a column of royal grenadiers, but fell at the head of his troops, who were repulsed with considerable loss. The enemy at length fell back to the ground occupied by Lee in the morning, whither Washington was preparing to follow them when the approach of night and the exhaustion of his men induced him to defer the execution of his plan until the morning. During the night Clinton effected a

noiseless retreat, and at daybreak was many miles away from the scene of battle. The excessive heat of the weather and the fatigued condition of the troops rendered a pursuit impracticable, and the royal army was suffered to proceed unmolested to the place of embarkation. The American loss in this engagement was 69 killed and 160 wounded; the British 300 killed and 100 prisoners including wounded. Their total loss by desertions and the casualties of battle during their march through New Jersey has been estimated at 2,000. For his conduct in this battle Lee was court-martialed and suspended for one year from his command. Consult Carrington, H. B., *Battles of the American Revolution* (New York 1876); Dawson, H. B., *Battles of the United States* (New York 1858).

MONMOUTH COLLEGE, in Monmouth, Ill., a coeducational institution, under the auspices of the United Presbyterians. It was founded in 1856. At present the college is under control of the Presbyterian Synods of Illinois and Nebraska, the second Presbyterian Synod (Ohio and Indiana), the Presbytery of Keokuk, Iowa, and the Alumni Association. The college courses lead to the B.A. and B.S. degrees. There are some 45 scholarships, various prizes, and four endowed professorships. The endowment fund of the institution is definitely given as \$1,750,000. Enrollment in 1947 was 835 students.

MONMOUTHSHIRE, a county in England, bounded on the west by Wales, on the north by Herefordshire, on the east by the river Wye, and on the south by the river Severn (q.v.). The Monnow River which rises in the Black Mountains flows into the Wye at Monmouth (q.v.) and forms the northeast boundary. The Wye then joins the Severn at Chepstow (q.v.). The Usk River begins in the Breconshire hills and flows into the Severn below Newport (q.v.). Geologically, the county is divided into two divisions, the sandstones and the limestones. Old Red Sandstone is the predominant formation, but there is a small central portion of Silurian rocks, and a western section of Carboniferous stratum. The alluvial soil near the mouth of the Usk and the Severn and the eastern half of the Usk Valley are rich agricultural districts. Coal mining and ironworks near the seacoast facilitate transportation for export. Other industries include limestone quarrying and brick-making.

Monmouthshire was occupied by the Romans and formed the division *Britannia Secunde*. In 43 A.D. Aulus Plautius established a Roman colony at Camalodunum (now Colchester), and in 47-50 Ostorius Scapula advanced across England to conquer Wales. For sometime Caratacus (q.v.) son of Cunobelinus (Cymbeline), king of Trionobantes, successfully opposed these Roman invasions, but in 78 A.D., Julius Frontinus finally conquered Wales. During the three centuries of Roman rule, military roads and fortresses, such as those at Caerwent and Caerleon (q.v.), were constructed. In 408 A.D. the Roman legions withdrew and took with them many young Britons. The Anglo-Saxons invaded the country before the close of the 6th century, and in the 8th century, Offa's Dyke (q.v.) was built. The Danes made their appearance in the 9th century and in 976 destroyed Caerleon where the mythical King Arthur is credited with having built his dominion.

In 1034, Canute (q.v.) overran Gwent, as Monmouthshire was then named, and in 1063, Harold conquered the district in order to put an end to Welsh incursions along the border. After the Norman conquest under William, duke of Normandy, the barons governed the country under the name of the Lords of the Marches and erected many castles, many of which are still standing today. The famous Tintern Abbey (q.v.) was built in 1131.

In 1535, Monmouthshire was joined to England by Henry VIII, but was considered a Welsh county for administrative purposes until the reign of Charles II. The lords marchers' legal authority was ended by an act of William and Mary in 1689. The county has still retained many Welsh names and customs, and church services are frequently performed both in English and Welsh.

According to the latest (1931) census, the administrative county including the associated County Borough of Newport has an area of 349,569 acres (as constituted June 30, 1930), and a population of 434,958.

MONN, Georg Matthias, Austrian musician: b. Austria, 1717; d. Vienna, Oct. 3, 1750. He was the organist at the Karlskirche and later became known for his compositions which inaugurated the transition from the classic to the modern style which was perfected by Johann Wenzel Anton Stamitz.

MONNA VANNA. In 1902 Maurice Maeterlinck, who for a dozen years had been composing tenuous dramas of the imagination, expressive of vague fears, and symbolic of the coming of death, turned in *Monna Vanna* a more usual type of play. In place of an air plot but half suggested, he developed a close-knit story; in place of shadowy figures uttering childlike phrases and implying as much by their silence as by their talk, he presented living figures engaged in rhetorical debate; and in place of the merest impressionism of mood, he displayed a sudden practical interest in problems of conduct. Two such problems, in particular, he considered: first, as to whether a woman might ever honorably sell her honor, and, second, as to whether her husband's disbelief in the purity of her motives might ever justify her leaving him for one who could understand her. *Monna Vanna*, in order to save the lives of 30,000 starving Pisans, besieged by the Florentines, consents to yield her honor to the commander of the enemy. But the latter, her boyhood lover, refuses to profit from the advantage he has taken of her and, assailed by the state he serves, returns with her to Pisa as her guest. Her husband, who has raged against her decision to go to Prinzevalle in the first place, refuses to believe that this warrior has spared her. She can rescue him from death only by falsely proclaiming his guilt and her own desire for vengeance, thus gaining possession of the keys to his dungeon, from which she will flee with him at the earliest opportunity. Thus Maeterlinck, like Shakespeare in *Measure for Measure* and Phillips in *Pietro of Siena*, though he raises the question of a woman's right to barter her honor for the life or lives of others, does not venture to exact of her the price. Such is his procedure also, in two other plays, *Joyzelle* and *Marie*.

Magdeleine. Neither of these has been so successful upon the stage as *Monna Vanna*, which may be read in the English versions of A. I. du Pont Coleman (1903), Charlotte Porter (1904) and Alfred Sutro (1907). The piece is discussed in the monographs on Maeterlinck by Gerard Barry, M. J. Moses, Edward Thomas and Una Clark.

FRANK W. CHANDLER.

MONNIER, Henri Bonaventure, French author and caricaturist: b. Paris, June 8, 1805; Paris, Jan. 3, 1877. He is best known for the creation of the characters Mme. Gibou and M. Prudhomme. He illustrated Béranger's *Chansons* (1828) and La Fontaine's *Fables*. In 1831 he became an actor for a short time and excelled in his own plays. Later he wrote and illustrated *Scènes populaires* (1835-62) and *Mémoires de Joseph Prudhomme* (1857).

Among his other works are *Les Compatriotes* (1849), *Grandeur et décadence de M. Prudhomme* (comedy, 1853), *Le Roman, chez la portière* (1855), *Le Bonheur de vivre aux champs* (1855), *Peintres et bourgeois* (1855), *Joseph Prudhomme chef de brigands* (comedy, 1860).

MONNIER, Marc, French author: b. Florence, Italy, Dec. 7, 1829; d. Geneva, Switz., Apr. 1885. He became a professor and rector at the University of Geneva, and was best known for his books on Italy, although he also wrote some poetry.

Among his books are *Lucioles* (poetry, 1853), *L'Italie estelle la terre des morts?* (1859), *Gari-baldi: Histoire du brigandage* (1863); *La amorra* (1863), *Poésies* (1878), *Récits et Monophtones* (1880), *Gian et Hans; le Charmeur* (1882), and *Histoire générale de la littérature moderne* (1884).

MONO, mō'nō, a lake or "sink" in Mono County, Calif., on the eastern slope of the Sierra Nevada, in a gold and silver mining region, about 150 miles southeast of Sacramento. The lake is circular in form, nearly 15 miles across; area, about 200 square miles, contains almost as a central point, Mono Island. Altitude 6,400 feet.

MONOCACY, Battle on the. A battle in the Civil War, July 9, 1864, at Monocacy River, Md., near Frederick, during the Shenandoah campaign in which 20,000 Confederate troops under Gen. Jubal Anderson Early defeated a small force of 2,700 Union troops under Gen. Lew Wallace. In order to thwart the Union successes in western Virginia and the Shenandoah Valley which had cut Gen. Lee's supply communications, Gen. Early had been ordered to defeat Gen. David Hunter and to move on to Washington. The great importance of the battle, which occurred during this drive, lies in the fact that despite a Union defeat, the day gained by delaying Gen. Early enabled the defenses of Washington to be strengthened. As a result, when the weakened Confederates reached the capital they were defeated and were pushed back into the valley across the Potomac. also WASHINGTON, EARLY'S ATTEMPT ON.

MONOCEROS, mō-nōs'ēr-ōs, or **UNICORN**, a constellation of modern origin located between Canis Major and Canis Minor and just to the east of Orion. Lying directly astride the Milky Way, it is a relatively inconspicuous aster-

ism, its brightest star, α Monocerotis, being of the 4th magnitude. It is a winter constellation, and is on the meridian at 9 P.M. on February 22.

MONOCHROME, mōn'ō-krōm (Gr., *monos*, single, + *chrōma*, color), in ancient art, a painting executed in a single color. The word is generally applied to painting in the various shades of the same color. The first specimens of the art of painting were of one tint only, which most commonly was red, made either with cinabar or minium. Instead of red, white paint was sometimes used. The first four plates in the first volume of the paintings of Herculaneum contain several monochromes upon marble. The most numerous monuments existing of this kind of painting are on terra cotta.

MONOCOTYLEDONS, mōn-ō-kōt-ī-lē'-dūn (Monocotyledonae, sometimes called Alter-nifoliae), representing the smaller of the two subclasses of the flowering plants (Angiospermae), including about 2,000 genera and some 40,000 species of mostly herbaceous (lilies, grasses, sedges, and orchids) and less commonly tree-like plants (such as palms, dragon's blood, and yuccas). As the two subclasses do not differ in the structure and development of their gametophytes (sexual generation) and early embryology, monocotyledons are distinguished from dicotyledons by the following outstanding characteristics: a single, terminal cotyledon that remains usually within the seed (hypogeal) and absorbs nutritive materials from the surrounding copious endosperm; primary root short-lived, soon replaced by adventitious roots; stems without central pith and annual-layers, as the vascular bundles are closed (without cambium) and irregularly scattered; secondary growth in thickness rare and different in mode from that of the dicotyledons and attained either by enlargement of cells or occasional formation of a secondary cambium in the bark; branching habit of above-ground stems poorly developed except in inflorescences; leaves mostly parallel-veined with simple cross-veins, often with broad base and without petiole; flowers frequently 5-whorled with the parts in twos, threes, fours, or sixes, never in fives. Long regarded as more primitive, and placed ahead of the dicotyledons, monocotyledons are now considered as an offshoot coming from primitive types such as belong to the order Ranales (Dicotyledoneae), and placed after the dicotyledons. Fossil monocotyledons appear together with fossil dicotyledons during the Cretaceous period, but are undoubtedly of greater age, as suggested by the fossil palmlike leaf (*Propalmophyllum*) found in Liassic deposits in France. (See DICOTYLEDONS).

MONOD, mō-nō', the name of a French family, many of whose members were Protestant clergymen.

FRÉDÉRIC JOËL JEAN GÉRARD MONOD: b. Monnaz, Switzerland, May 17, 1794; d. Paris, France, Dec. 30, 1863. Ordained in 1818, he assisted his clergyman father in Paris, becoming (1832) titular pastor of the Oratorio. He was an orthodox Calvinist, and after the revolution of 1848, as he favored the separation of church and state, he founded the Église Libre or Free Church, which united the Protestant congregations who had left the state church. Frédéric Monod founded in 1824 the *Archives du Chris-*

ianisme au dix-neuvième siècle, which he edited until his death.

His brother ADOLPHE THÉODORE MONOD (1802-1856) founded an Evangelical congregation at Naples (1825-1827) and at Lyon (1828-1831). A professor at Montauban from 1836, he was also minister of the Reform Church in Paris from 1847. He was considered one of the foremost Protestant preachers of his time, and he published sermons for whose subject and delivery he was famous.

TWO other members of the family, GUILLAUME MONOD (1800-1896), and WILFRED MONOD (1867-) were also Protestant clergymen.

MONODY, mǒn'ô-dī (from the Gr. *monos*, single, + *ōidē*, song), a song or melody confined to a single voice (homophony) in contradistinction to the song of several or many voices (polyphony). The term has come down to modern times as conveying a sense of melancholy or sadness, as in a funeral song or dirge. Thus in literature a monody is a composition dwelling on some single emotional subject. Its most familiar use, however, is in music, applying to a solo song in recitative style and instrumentally accompanied. Introduced into Italy at the end of the 16th century, it was an attempt to return to the music of the Greeks. It flourished in the home of Giovanni Bardi, in Florence, and was adopted by such composers as Jacopo Peri (1561-1683), who introduced it in *Dafne* (1594), now considered the first opera. Giulio Caccini (1550?-1618) made a collection of monodies in *Nuove musiche* (1602). The operas of Claudio Monteverdi and Marco da Gagliano were early examples of the effect of monody on music.

MONOGAMY, mô-nōg'â-mī (from Gr. *monos*, single + *gamos*, marriage), that form of marriage in which the husband has one wife at a time, as contrasted with bigamy and polygamy, and also with polyandry, in which a woman has two or more husbands. Because the natural sex ratio of mankind never departs widely from a one-to-one relationship, there being almost an equality of male and female births, monogamy is more usual in simple primitive societies than polygamy. However, whenever there is a considerable excess of marriageable females over males, due to war or other causes, polygamy is frequently resorted to until the balance is redressed. In more complex societies, monogamy is customary in the lower classes, polygamy in the upper. The possession of more than one wife is in some societies a badge of social distinction. In modern secular states polygamous marriages are illegal. See also MARRIAGE, HISTORY OF.

MONOGRAM, mǒn'ô-grām, from the Latin *monogramma*, ultimately from Greek μόνος, single, and γράμμα, letter, is a character or cipher combining two or more letters (rarely a single letter) to represent a name. In Greek and Roman times monograms were extensively used on coins, medals, and public monuments. The most famous monogram undoubtedly is that which was incorporated in the Labarum (q.v.), that is, the intertwined letters chi and rho which are the first two letters of Greek χριστός, Christ. In medieval times there was a proliferation of monograms, especially as used by merchants who were not entitled to display coats of arms. The commercial trading monopolies, like the Dutch

East India Company, usually displayed monograms on their house flags. Perhaps the most famous of artist monograms are those of Rembrandt and Dürer. Among royal monograms may be cited those of Charlemagne, Hugues Capet, St. Louis, and the combined monogram of Henry II and Diane de Poitiers.

MONOLITH, mǒn'ô-līth, a stone block, usually monumental and of large dimensions. It may be an unhewn menhir; the capstone or support of a megalithic monument; a hewn obelisk; a sarcophagus; a sculptured temple; or a colossal statue. Stonehenge (q.v.) is an example of a monolithic monument. See also MENHIRS.

MONOLOGUE, mǒn'ô-lōg, a term traditionally signifying a dramatic recitation of considerable length in a stage performance by one actor uninterrupted by other performers on the scene. The convention of the monologue, used to acquaint the audience with the situation and the meaning of the drama, is very old. Sophocles used it in his monologue of the dying Ajax, and Shakespeare supplies a famous example in Hamlet's soliloquy, "To be or not to be." Other celebrated monologues are those of Auguste in Corneille's *Cinna*, of Sosie in Molière's *Amphitryon*, and Beaumarchais' Figaro. Victor Hugo used the device in *Hernani*, showing the Emperor Charles V meditating before the tomb of Charlemagne. The monologue and the soliloquy are often synonymous. However, in an extension of the term "monologue" the word is often used with a more limited meaning, to signify a dramatic recitation by one actor who may assume several parts or leave to the listener's imagination responses of an unheard as well as unseen member of a dialogue.

MONOMANIA, mǒn-ô-mā'nī-â (from the Gr. *monos*, single + *mania*, madness), that form of mental derangement which distinguishes itself by an abnormal conception or action on one subject only, leaving the mind sane on all other points.

MONOMETALLISM. See BIMETALLISM.

MONONA, Lake. See FOUR LAKES.

MONONGAHELA, mô-nōn-gâ-hē'lâ, city, Pennsylvania, in Washington County, 17 miles south of Pittsburgh on the Monongahela River. It is served by the Pennsylvania and the Pittsburgh and Lake Erie railroads, and has an airport. At an altitude of 754 feet, it lies in a coal and gas region with dairy, poultry, fruit, and truck farms. The chief manufactured products are commercial stokers, springs and axles, machinery, fire brick and other clay products, steam producing equipment, chemicals, and costumes. Many of the inhabitants work in the large steel mills near by at Donora and Clairton.

Joseph Parkinson settled here in 1792; and here, in August 1794 at Whiskey Point, Albert Gallatin made the speech that persuaded the men in the Whiskey Rebellion not to resist federal troops. Originally called Parkinson's Ferry, the place was incorporated in 1833 as the borough of Williamsport. Four years later the name was changed to Monongahela City. Monongahela, meaning "river with the sliding banks," is from the Indian word Menaungehilla.

The city was chartered in 1873, but in 1893 the word "City" was dropped from the official title. In 1951 it had a commission form of government. Pop. (1950) 8,922.

MONONGAHELA, river, West Virginia and Pennsylvania, which has its source in the northwestern part of West Virginia, and flows north into Pennsylvania, where it unites at Pittsburgh with the Allegheny to form the Ohio River. The headwaters of the Monongahela are in the Alleghany Mountains near the headwaters of the Potomac. The two headstreams of the Monongahela unite near Fairmont in Marion County, W. Va., and from the point of junction on the north become a swiftly flowing stream, furnishing water power for several manufacturing towns and cities. The whole course is very irregular; the length is about 300 miles. The river was made navigable about 106 miles from its mouth to Morgantown, in Monongalia County, W. Va., by a system of nine locks, and other locks above Morgantown now make the river navigable as far as Fairmont. See also PITTSBURGH.

MONONUCLEOSIS, mōn-ō-nū-klē-ō'sis also known as **GLANDULAR FEVER**, a disorder of unknown etiology, but probably of infectious origin. It is characterized by irregular fever, enlargement of lymph glands and spleen, and by the presence in the blood of an increased number of lymphocytes of a peculiar type. It has been recognized as a distinct disease entity only since 1935.

Occasionally it is observed in epidemic form in certain localities. The clinical picture depends somewhat upon the stage of the disease. In the prodromal period (3 to 6 days) symptoms are somewhat vague: chilliness, slight rise in temperature, sore throat, and swollen neck glands. In the middle stage (second week) cervical glandular enlargement is seen in 75 per cent of cases, with the enlarged glands somewhat tender. Soreness of the throat now becomes more pronounced, the mucous membranes being of a bright red color. The throat condition may resemble that of acute tonsillitis, Vincent's angina, or even diphtheria. The occurrence of jaundice is fairly common. After 20 days the stage of convalescence sets in, but recovery may be extremely slow. The patient is often greatly weakened, and relapses are by no means uncommon. The blood count shows a leucocytosis of from 10,000 to 15,000, the count being due to lymphocytosis. Since 1932 the most important laboratory test for this disease has been the heterophil antibody reaction, the clumping of sheep cells by the serum of infectious mononucleosis patients.

HAROLD WELLINGTON JONES, M.D.

MONOPHYSITES, mō-nōf'i-sitz (from Greek *monos*, single, and *physis*, nature), those followers of the opinion in the early Church which ascribes but one nature to Christ in contradistinction to the orthodox doctrine that he was both divine and human, true God and true man. The Monophysites were mainly confined to the Eastern Church and obtained no footing in the West. The edict called Henoticon, issued by the Emperor Zeno in 482, was not able to quiet the long and often bloody contests incident to this controversy, and the orthodox Church, by its sentences of excommunication, occasioned a formal secession on the part of the Monophysites. This separation took place in the first half of the 5th century. Nor did they remain united among

themselves. In 519 controversies arose among them respecting the question whether the body of Christ is corruptible or not.

About 560, a Monophysite, Askunages, and after him Philoponus, a noted Alexandrian philosopher of that century, conceived the idea of styling the three persons of the Deity three Gods. These Tritheists and their adherents, even in the eyes of the Monophysites, were heretics, and were the occasion of many Monophysites turning Catholics. In Egypt, Syria and Mesopotamia the Monophysite congregations, however, remained the strongest, had patriarchs at Alexandria and Antioch, existing without interruption by the side of the imperial orthodox patriarchs. After the Syrian, Jacob Baradaeus had, about 570, established their religious constitution, they formed the independent churches of the Jacobites and Armenians, which separated from the Greeks as well as the Romans, and have for that reason been able to maintain themselves since the 7th century, even under the dominion of the Mohammedans.

Excepting their doctrine of one nature in Christ, they coincide, in the main points of belief, with the Greek Church; their worship also resembles the Greek rather than the Roman, but has, from their national character and their superstition, received variations, which are most striking in the religious constitution of the Egyptian Jacobites. See also JACOBITE CHRISTIANS; ARMENIAN CHURCH.

MONOPLÉGIA, mōn-ō-plē'jī-ā, paralysis of a single limb, muscle, or muscle group. If it involves the face it is designated as *facial*, if the arm, *brachial*, and if the leg, *crural*. It is also termed *central* if arising from a lesion in the central nervous system, and as *peripheral* if occurring as the result of an injury to a peripheral nerve. A monoplegia of central origin is a poliomyelitis affecting the muscles of one leg. See also BRAIN, DISEASES OF THE; PARALYSIS.

HAROLD WELLINGTON JONES, M.D.

MONOPOLI, mō-nō-pō-lī, town, Italy, in the province of Bari, 26 miles east-southeast of Bari on the Adriatic Sea. Interesting for its historic remains and 12th century cathedral, it is a modern industrial center, manufacturing textiles, flour, macaroni, soap, lubricating oil, and exporting olive oil, wine, and olives. Pop. (1951) 22,600.

MONOPOLY, control by an individual, a business concern, a group or government that makes it possible to fix the prices or regulate the output of one or more articles or services. As it concerns price, monopoly means the power to fix the price of a product or a service by arbitrary methods, such as by controlling the supply. It is an exclusive right given to one or more persons to carry on some branch of trade or manufacture.

The most frequent monopolies formerly centered around the exclusive privilege to trade in certain foreign countries, to import or export certain articles, or to practice certain arts or trades. Such monopoly privileges were very common in Great Britain, particularly during the 15th and 16th centuries. Several British companies of an essentially monopolistic nature, such as the Hudson's Bay Company and the East India Company, created to exploit the resources of Great Britain's

far-flung colonial empire, continued to wield considerable influence until well into the 19th century.

In general, monopolies fall into two classes: (1) public, and (2) private. Public monopolies are those undertaken by the government and would include such economic activities as the federal postal service, or the operation of toll highways by the states, or electric power plants by a municipality. Private monopolies are those held by business organizations and individuals. They may originate either from (1) a privilege granted by the government, (2) the possession of superior skill or talent, or (3) from the ownership of capital.

Thousands of private monopolies exist as the result of a privilege granted by the government in the form of a franchise, a patent, or a copyright. A franchise may confer upon a business enterprise the exclusive right to operate an electric power plant, a bus line or a railroad in a given locality. Franchises need not be exclusive; nor are they always given in perpetuity. They are granted because from the point of view of society it is considered desirable to reduce or eliminate ruinous competition in certain lines of business activity.

A patent is a right granted by the federal government (United States Patent Office) to an inventor, giving him the exclusive privilege to manufacture and market his invention for a period of 17 years. A copyright gives an author the exclusive right to his literary efforts for a period of 28 years, and may be renewed for an additional 28 years. Monopolies in the form of patents and copyrights are considered socially desirable because they promote social and economic development by stimulating new inventions and works of literature.

Certain individuals endowed with superior talent in the arts are a monopoly unto themselves. A gifted musician or a talented actor can command large sums of money for a single performance because the absence of competition creates a monopoly for those so endowed.

Quite frequently, the ownership of capital tends to result in the creation of a monopoly. Relatively few people are free to engage in the business enterprise of their choice. In most instances the selection of a business is limited both by the capital resources of the individual and the capital requirements of the enterprise. It is evident, for example, that the amount of capital necessary to organize an automobile manufacturing company or a steel company is so large that the average individual would be prevented from entering either of these lines of endeavor. Thus, the established manufacturers of automobiles and steel need not be concerned, as a rule, over the possibility of additional competition resulting from new entrants into the field. While others are not restricted largely from entering, the lack of capital gives the established firms a partial or total monopoly.

Because monopoly prices usually are higher than competitive prices, it is sometimes assumed that when a monopolist is free to fix his price, he will charge the highest price possible. But such is not always the case. In the final analysis, the motive of the monopolist is identical with that of any other business man in a capitalistic society; namely, to obtain the largest amount of net profit from the operation of his business. To achieve this objective, it may be necessary to reduce the price as a means of broadening the

market for the product. Whether the monopolist decides to curtail or expand output depends upon which course of action will increase his profits. In this connection, the cost of production is controlling factor. Under certain circumstances where the monopolist can lower total unit costs by expanding output and thus spreading his fixed costs over a larger number of units of production he will do so. Fixed costs include such items as bond interest, real estate taxes and administrative salaries which remain constant in amount regardless of the level of production. Obviously, if production can be increased, the burden of fixed costs which must be borne by each unit of output is lowered. On the other hand, if an increase in production will be accompanied by higher fixed costs per unit, as sometimes happens, the monopolist is reluctant to expand output, unless other considerations alter his decision.

In addition to the profit motive and the cost of production, other factors which will influence the price charged by a monopolist are: (1) the development of substitutes, (2) the fear of competition, and (3) the fear of public regulation.

In addition to competition between goods of the same general type, a substantial degree of competition exists among different products which may be adapted to the same use. For example, shoes can be manufactured from a wide variety of materials other than leather. If a monopolist were to develop in the leather industry, and excessive prices were charged for the product, the consumer might be compelled to forego the purchase of leather shoes for those manufactured from other materials. Recognition of this principle of substitution would undoubtedly set a ceiling on the price that could be charged by the leather monopolist for his product.

If the monopoly is not protected by law, the fear of inviting competition might deter the monopolist from charging too high a price for his product. Potential competitors, attracted by the possibilities for large profits in the industry, might be encouraged to enter the field.

The monopolist readily recognizes the political dangers inherent in charging exorbitant prices. High prices and excessively large profits frequently are an open invitation to government control. The fear of public indignation which might erupt at any time in a demand for public regulation or public ownership often is sufficient to prevent a monopolist from fixing his price too high.

Although the states had sought to regulate monopolistic industries earlier, the first attempt at such regulation by the federal government occurred in 1887 with the passage of the Interstate Commerce Act. Strangely enough, the Interstate Commerce Act was not prompted by a desire to encourage competition among the railroads, but rather by a wish to eliminate the ruinous competition that threatened the solvency of the entire railroad industry. During this period it was possible to purchase a one-way coach ticket from New York to Chicago (a distance of about 900 miles) for twenty-five cents—meals included. The Sherman Antitrust Act of 1890 marked the first attempt on the part of the federal government toward blanket legislation aimed at curbing business trusts and other manifestations of monopoly. The Sherman Act declared illegal any business combination that was in restraint of trade. The Clayton Act of 1914 greatly expanded the government's authority to regulate

big business," particularly in the banking field; while the Public Utility Holding Company Act of 1935 imposed the "death sentence" upon certain types of holding companies in the public utility field.

PATRICK DE TURO.

MONORAIL, mŏn'ô-râil, a single rail arranged to serve a useful purpose, usually for the transportation of materials by a wheeled carriage truck. Many industrial monorails are used for the handling of relatively heavy pieces of material or equipment which are moved generally along the same routing and do not require more elaborate crane facilities. These installations frequently depend on hand power for horizontal movement although monorail may also be the basis of a power operated conveyor system.

Monorail has also been used for the transportation of people, and because of its inherent advantages is being seriously considered for mass transportation in the United States. In 1901 in the Ruhr Valley of Germany, a monorail transportation system was built between Barmen, Elberfeld and Vohwinkel in Wuppertal near Cologne. This installation was $8\frac{1}{4}$ miles in length and has operated satisfactorily since its original installation. Over the first 33 years of operation, this line carried an average of 13 or 14 million passengers per year. The supporting structure shown in Fig. 1, is a system of latticed longitudinal girders, one vertical and two horizontal, assembled into the form of an I section. The main girders form the web of the I, and the lateral girders, which give the requisite lateral stiffness, serve as the top and bottom flanges of the I. Diagonal tie rods extend from the upper panel points of the central girder to a connection with the chords of the bottom lateral girder. The last mentioned chords consist of steel I beams, and upon their upper flanges is laid the single T rail, from which the cars are suspended and on which the trucks run. The girders, which vary in span from about 69 feet to 108 feet, are carried upon supports varying in structural design with the locality where they are used. Where the railway is carried immediately above the Wupper River the A-frame style of support is used, while in towns through which the line passes the trusses are carried upon substantial inverted U frames, shown in Fig. 1b. The A frame consists of two rectangular latticed struts, which are united at the top by a rectangular plate yoke. The cars are 37.7 feet long, 8.5 feet high and 6.88 feet wide; are therefore fairly long and narrow, and are slightly tapered at the ends. They have a seating capacity of 50, are built with two side doors opening inwardly, and two auxiliary doors at the ends. The total weight of a car is 12 tons. Each car is freely suspended from two trucks spaced about 25 feet apart. The wheels, about 3 feet in diameter, are mounted in tandem to run on a single rail and are driven by two electric motors of 36 horsepower each, through the medium of gearing. The motor trucks receive power by means of a sliphoe and contact rail, which is carried on the bottom of the lateral girder, somewhat to the inside of the main supporting beam. The truck frames embrace the rail girders and the rails so closely that derailment is impossible. If a wheel or axle should break, the cars would be supported by the frames. The cars swing around the curve in a slightly inclined position and spontaneously re-

assume their normal vertical position when a tangent part of the rail is reached. To the passengers, the change in equilibrium is imperceptible.

The modern conception of Suspended Monorail for passenger service, called Monorailway, shown in Fig. 2, although none were in actual operation as late as 1951, has progressed considerably beyond the original design without the loss of any of the fundamental advantages. Many of the improvements have been adopted from progress in structure and equipment designs of analogous systems. The running rail is supported by a simple box girder of sufficient strength to obviate the necessity of cross bracing between the two rail supports of a double-track line. Thus, the lattice-work effect of the Barmen-Elberfeld-Vohwinkel construction has been eliminated.

The supporting structure may be an arch type bent, or where more suited to the conditions, a single column with suitable cantilever brackets. Any semblance to a floor above the street has been entirely removed. Except on extremely narrow streets, the supporting structures are simple columns approximately 36 inches in the cross-street dimension by 20 inches; or, as an alternate, of octagonal section 36 inches across flats. The first, or rectangular, columns supporting transverse brackets 20 inches wide by 30 inches deep are suitable for spans, or distance between columns, of 60 feet; while the octagonal type permits spans up to 78 feet by replacing the simple transverse bracket by a spider, having four arms 15 inches wide and 30 inches deep, set at 45 degrees to the street center line. Irrespective of the type of structure, the rail is carried on a sound and vibration-dampening member supported by a $15\frac{3}{4}$ -inch box girder 36 inches deep. The car body and electrical equipment are a logical adaptation of the PCC (President's Conference Committee) trolley car development.

Modern high strength, lightweight materials are used to the fullest extent found to be economical. All cars are equipped with four high-speed motors and operated in multiple from a single control point for each train. Motorizing all four axles per car makes the entire weight available for rapid acceleration and makes breaking rates within conservative values of adhesion. Balancing speeds as high as 50 miles per hour on level tangent track, and corresponding higher maximum safe speeds, are feasible. The car body, except in the case of the leading unit to which a streamline nose is added, is approximately 48 feet long and nine feet six inches wide. The weight, although dependent upon the materials used, e.g., stainless steel or aluminum, is approximately 15,000 pounds. The "inverted" construction presents a distinct advantage in design. The body is essentially a hollow, nearly tubular, beam suspended at two points on the top. Between these points the relatively heavy backbone, provided to absorb buffing stresses from couplers above the end doors, is in compression. The lower side being in tension can be relatively light. The seating arrangement provides for 48 seated passengers per car, 12 riding forward, 12 backward and 24 on longitudinal seats, together with a maximum of standing room. There is no aisle space subject to congestion between any seat and the nearest door. This arrangement is substantially the same as that found to be the most efficient in actual subway service in New York

City. Three large, double doors are provided in each side to facilitate the rapid loading and unloading essential to high-speed rapid transit. Communicating doors are provided in the ends of the cars. Each of the two trucks supporting a car has two 25-inch wheels and a wheelbase of approximately nine feet. In addition to the wheel, the short axle somewhat over two feet long carries a brake drum and the driving gear and gear box for one motor. The axle runs in two roller bearings carried by a sub-frame which in turn is restrained by pedestal guides and a driving link, and supports the main truck frame through springs.

The principle of the truck is similar to the PCC trolley car truck but adapted to two wheels instead of four. The wheelbase, somewhat longer than that of modern street car trucks, permits staggered tandem mounting of the motors with two drive shafts, one passing on either side of the center pin. It provides a long guiding arm leading to low flange pressures and good tracking characteristics. Another important result is the wide distribution of the car weight over the supporting structure. The motors are of conventional high-speed design driving through shafts and high-ratio, right-angle reduction gears on the driving axles. They are attached to the truck main frame by bolts and hook-shaped safety brackets. All motor weight is thus spring-borne. Their rating is dependent, of course, upon service requirements. The truck is designed to accommodate conventional clasp-type air brakes operating on a special brake drum with an individual brake cylinder for each axle, mounted on the truck frame. Alternately all-electric braking could be adopted, as on the latest projected PCC cars, eliminating compressed air entirely from the car. The supporting member between the truck center pin and the car body is one of the unusual parts of the equipment. First, by means of a vertical center pin, it provides for rotation, in a horizontal plane, of the truck relative to the car body, thus accommodating horizontal curves. Second, it also permits similar rotation of the truck in a vertical plane to pass through vertical curves of the track. This is accomplished on a cylindrical trunnion rather than by a rocking center bearing. Having only one running rail, there is no cross-track rotation for which provision must be made. The chances of truck derailment are extremely slight due to the easy guiding characteristics of the truck and the absence of an over-turning moment while the tendency of a flange to mount the rail on a curve is also reduced. Despite all this, the car hanger arm is carried over the rail and forms a safety hook designed to catch on the rail in case derailment should occur.

There have been many other attempts to create monorail systems of different designs. Among them the following have been most outstanding.

The first car run on a single rail, the invention of Charles Lartigue (1834-1907), was in practical operation for many years in Djibouti, a French-African post. The car is kept vertical by its attachment to a laterally placed horse, which balances the car as a hansom is balanced by attaching the horse in front. An early type of monorail was one where all the different resistances to a moving car or train, except the atmospheric resistance, were concentrated in the vertical plane of the center of gravity of the car or train because the car was suspended below the

track. The downward vertical force consisted of the weight of cars, trucks and load. This weight was delivered to, and directly sustained by, two centrally disposed bearing rails laid with precision as to alignment and surface, and closely gauged to each other, so as to constitute practically a single support.

The design of William B. Mack appears to have been awarded much consideration among engineers. As far back as 1872 a charter was granted in the State of New York for the building of a hanging railroad which had the general mechanical principles of hanging loads later exploited in Germany, France and Russia, but the Mack system was to be the only serious effort made at hanging cars on the side of the structure in place of underneath.

In 1888 the Enos Electric Railway of St. Paul, Minnesota, planned to build a suspended monorail, shown in Fig. 3, much like the Wuppertal system previously described, except with the track girders supported on single columns and cantilever arms, to enter the city on South Robert Street, proceed to State Street, to Greenwood Street, to East Delos Street, to Starkey Street, and to cross the Mississippi River at Cedar. It was actually constructed from the top of the hill at South Park, now South St Paul to Bryant Avenue. An ordinance, recommended by the Committee on Streets specified "the track must always be 20 feet above the ground, supported by steel and wooden posts set 42 feet apart."

Eben Moody Boynton (1840-1927) patented plans for a monorail which were approved by such experienced men as Austin Corbin. Several short test roads were built and operated. A modification of his plan was put into use in Tunis North Africa. Here the single rail was laid on the ground like the rails of steam roads and trolley lines. Over the single rail at fixed intervals were trusses, or bents, joined by cross pieces at the top and supporting the guides which prevented the car from toppling over. The car was balanced on the single rail, the wheels being of the grooved pattern. At first some apprehension was expressed that in going around curves the centrifugal motion of the car would impose too great a strain on the bents, but this fear proved wholly groundless. Allowing for the centrifugal force by inclination of the car toward the inner side of the circle, which is accomplished on ordinary railroads by superelevating the outer rail removed most of the loading from the bents.

The English monorail known as the Behr System after its inventor, Fritz Bernhard Behr (1842-1927), was in operation for a number of years at Ballybunion, Ireland, and was successfully tested by the Belgian government, securing a speed of 83 miles per hour with a car weighing 70 tons. In 1901 and 1902 the English Parliament granted Mr. Behr's company the right to construct a road between Manchester and Liverpool after the plans had been examined and approved by many eminent engineers. The monorail track was raised above the ground on an A-shaped trestle. Built in two parts, the trucks and car straddled the rail for balance and also had guiding wheels riding on rails on the ground on both sides of the trestle.

In May 1907, with a gyroscope monorail car Louis Brennan, C. B. (1892-1932), the inventor of the Brennan torpedo used by the British government, demonstrated before the Royal Society

MONORAIL

Two sections of the Ruhr Valley monorail transportation system built between Barmen, Elberfeld, and Vohwinkel in 1901, near Cologne

Fig. 1a (above) shows the A-frame style of support which is used where the railway is carried immediately above the Wupper River.

Fig. 1b (below) demonstrates the use of substantial inverted U frames as supports in towns through which the line passes. This scene was Barmen.

MONORAIL

Fig. 2 (above). This is a Monorailway, the modern conception of a suspended monorail for passenger service, although by the end of 1951 none was in operation.

Fig. 3 (right). In 1888, the Enos Electric Railway of St. Paul, Minnesota, planned to build a suspended monorail. However, only a section of it was actually constructed.

Great Britain that he had discovered a practical application of the gyroscope. The invention was, briefly, a system by which a car or a train of cars supported by a single row of wheels could travel on a single rail and maintain perfect equilibrium in motion regardless of the distribution of the load, wind pressure, etc. Automatic stability mechanism carried by the vehicle itself endowed it with this power. The mechanism consisted essentially of two flywheels rotated directly by electric motors in opposite directions at a very high velocity and mounted so that their action could be utilized. The model car, while running on a curved monorail, leaned and so automatically balanced the effect of centrifugal force.

In 1909 Froelich developed another type of gyroscopic car which did not pass beyond the experimental stage, and about two years later the system of P. P. Shchilovski was brought out in which the gyroscopic principle was also employed.

In 1930 George Bennie developed what was known as a Rail Plane which was essentially a suspended monorail but using two motor driven air propellers for the motive power for each car. A short section of the skeleton steel track was built near the Scotch city of Milngovie and cars were operated for demonstration purposes. The cars were prevented from swaying by a guide rail mounted on a part of the structure erected below the suspended car.

Late in 1952, Axel Wenner-Gren's technical staff built a $\frac{2}{5}$ th full scale model of a system called "Alweg" for demonstration on a mile-long track near Cologne, Germany. The model consisted of a streamlined, electric-powered three-car train with an inverted U-shape undercarriage. The inside of the inverted U rides on a flat steel plate having two side flanges and the two arms of the inverted U grip the side flanges from underneath. The steel plate is supported in the air by a series of concrete columns.

Vice President, Gibbs & Hill, Inc.

MONOTHEISM (Greek $\mu\acute{o}\nu\omicron\varsigma$ single $\Theta\epsilon\acute{o}\varsigma$ god), in religion, the belief that God is one or that there is only one God. The historical sources of monotheism are very ancient and involved; however, in the history of religious thought, three philosophical types of monotheism have developed:

The first type is exemplified in the later monotheism of the Israelitish tribes. The unity of God is derived from an ethical concept of the universe. God is one, holy and the righteous ruler of the world. He is the dispenser of justice, the giver of the law. He derives his power from the fact that he is the creator and, therefore, he enjoins upon his creatures ethical responsibility and heightened moral consciousness. Apart from the world, he sits in supreme jurisdiction over it.

In Greek philosophy we find the second type of monotheism, in which God as a unity or unifying principle is the source, the explanation of the order and rational coherence of the universe. According to Aristotle, he is at once the commanding general of the universe and the rational order of it.

The Hindu philosophy represents the third type. In its teaching, a distinction is maintained between the reality of the world and the

reality of God. The earth on which man lives and its phenomena are of the "stuff that dreams are made"; it is ephemeral, transitory, unreal. God, who is imminent in all things, is at the same time transcendental, superior—the ultimate reality. Knowledge of God cannot be obtained by intellectual reasoning alone. It must come as a direct revelation by insight to those souls who are best prepared to receive it. Therefore, the contemplative life is to be desired and commended in preference to the practical. Logically, this mysticism argues that, since knowledge obtained through sensuous experience is at best defective and limited, some comprehensive perfect reality partaking of the nature of all things must exist somewhere—and this is the one God.

These various types of monotheism did not exist as pure concepts practically, however. The continued study of the problem of the relation of the world to God brought about interesting syntheses of these several philosophies. The intellectualism of Greek monotheism which conceived the Logos or divine essence of things to be the ruler and the order of things at the same time, soon found its position besieged by ethical questionings. How establish the proper relationship between a remote, righteous God who orders all things and a lawless unjust world? How reconcile, in other words, the Greek rational and the Jewish ethical monotheism? The Neo-Platonic school turned to mysticism for the solution. Likewise, early Christianity found itself beset with similar problems, and in its answer also found recourse to transcendental philosophy necessary.

In Christian monotheism, a curious synthesis of all three monotheistic concepts is found, together with the doctrine of the personality of God. The ethical and mystical concepts predominate. The existence of a rational world is acknowledged to the point of fixing the ethical responsibility of human relationships. But beyond that, the things of the earth are untrue, imperfect, unreal. The whole truth is in God, of whom knowledge is obtained through insight and revelation. The concept of immortality solves the problem of injustice and evil, for in the after life all ethical readjustments are made. The Hellenistic concept of the universe as a well-ordered system capable of being fathomed by the intellect also survives in Christianity in the attempt to rationalize its doctrines and to build up a definite convincing system to establish the unity between the finite world and its infinite ruler.

Constant revivals of the third type of monotheism arise also out of the problem of synthesizing all three forms. The escape from the difficulties attendant upon the acceptance of any one of the three is generally in transcendentalism of some form or in scepticism. True monotheism must take into just consideration the ethical, rational and intuitional elements of religious philosophy.

MONOTHELETES, $m\acute{o}-n\acute{o}th'-\acute{e}-l\acute{e}t\acute{z}$, (more commonly, MONOTHELITES, -litz; Greek, *monothētaí*, from *monos*, and *thelō*, I will), a sect who maintained that though Christ had two natures coexisting distinctly in the unity of the person, yet these natures possessed or acted by but a single will—the divine, which so predominated over or absorbed the human as to deprive it of all action or efficiency. They have been regarded

as an offshoot of the Monophysites, though they themselves denied all connection with them. The doctrine originated with the Emperor Heraclius, who in 630, by adopting a middle course, attempted to reconcile the Monophysites to the orthodox church. The attempt was for a time successful. Heraclius consulted Sergius I, patriarch of Constantinople, on the new dogma, and he not only approved of it, but became its most active propagandist. At his instance, and mainly in consequence of his representations, Pope Honorius I addressed two letters to Sergius, which according to some interpreters would seem to favor Monothelism. The successors of Honorius condemned the Monothelites, and Martin I, in 649, issued a bull anathematizing them. For this he was sent prisoner to the Chersonesus by the Emperor Constans, who protected the Monothelites. The sixth ecumenical council, that of Constantinople (680), condemned this heresy, and with this the early controversies on the incarnation became gradually fainter, till they were forgotten amid the disputes between the Iconoclasts and their opponents.

MONOTREMATA, an order of mammals belonging to the subclass *Protothesia* (q.v.) and represented by the duckbill (q.v.) of Australia and Tasmania, and the spiny anteaters (see *ECHIDNA*), the range of which extends into New Guinea. In many respects they recall the *Sauropsida* and especially the birds, a fact reflected in the name *Ornithodelphia* sometimes applied to them. The most marked of these peculiarities are the obliteration of the sutures of the skull, the possession of a terminal canal (cloaca) into which both the digestive tract and the urogenital organs empty; the possession of a well developed coracoid bone; and the fact that they do not, like other mammals, bring forth living young, but lay eggs. After the eggs are laid they are transferred to a temporary pouch beneath the abdomen, where they hatch and the young are nourished by the mammary glands.

MONOTYPE. See **COMPOSING MACHINES**.

MONOXIDE, in chemistry, a compound consisting of one atom of oxygen united to one atom of another divalent substance, or of one atom of oxygen united to two atoms of some other monovalent substance. The word is used when it is necessary to distinguish two or more states of oxidation of the same substance. Thus CO is called "carbon monoxid," in distinction CO₂, which is called "carbon dioxid." Similarly Na₂O is "sodium monoxid," while Na₂O₂ is "sodium dioxid." See **OXIDE**.

MONREALE, mōn'rá-ä'lā, Italy, town in the Sicilian province Palermo, five miles southwest of Palermo city and connected with it by surface car tracks. It is the seat of an archbishopric, has a well-preserved cathedral (built 1174-89) with old bronze doors and beautiful mosaics, monumental graves of Norman kings; also there is a Benedictine abbey dating from the 12th century with a magnificent cloister of 216 mosaic pillars and large library. Among its other public edifices are a gymnasium and a lyceum. It has about 24,000 inhabitants.

MONRO, mōn-rō', Alexander, Scottish anatomist: b. London, 8 Sept. 1697; d. Edin-

burgh, 10 July 1767. He studied at Edinburgh afterward in London under Cheselden, and still further both in Paris and Leyden, at the former under Bouquet, and at the latter under Boerhaave. On his return to Edinburgh in 1719 he was made professor of anatomy and surgeon to the surgeon's company; in 1720, the first university professor of anatomy, though not inducted till 1725. He attended the wounded on the field at Prestonpans (21 Sept. 1745), and was an accurate observer, having studied the effect of the presence of solid bodies in the vermiform appendix, and otherwise anticipated later views. He resigned his professorship in 1764. His principal work is 'Osteology, a Treatise on the Anatomy of the Human Bones' (1726), once a popular textbook.

MONRO, Alexander, known as Secundus, Scottish anatomist: b. Edinburgh, 20 Mar. 1733; d. there, 2 Oct. 1817. He was son of Alexander Monro, called Primus (1697-1767) (q.v.). Educated at Edinburgh University (M.D. 1755), he also studied on the Continent and in 1759-1808 lectured at Edinburgh. In 1783 he described the communication between the lateral ventricles of the brain, known as the foramen of Monro. He published 'Three Treatises on the Brain, the Eye, and the Ear' (1797) and other medical works.

MONRO, Alexander, known as Tertius, Scottish anatomist: b. Edinburgh, 5 Nov. 1773; d. Craiglockhart, near Edinburgh, 10 Mar. 1859. He was the son of Alexander Monro (1733-1817) (q.v.). He obtained his M.D. at Edinburgh in 1797, was appointed conjoint professor with Monro Secundus of medicine, surgery and anatomy, and in 1817-46 was sole professor. His works include 'Observations on Crural Hernia' (1803), and other publications.

MONRO, Charles Carmichael, British general: b. 15 June 1860, entered the army in 1876 and served in India and South Africa with distinction. In 1914 he commanded the 2nd Division at Aldershot. The next year he was made lieutenant-general and in September succeeded Sir Ian Hamilton as Commander-in-Chief of the Dardanelles campaign.

Under his direction the Allied troops were withdrawn from their untenable position on the Gallipoli Peninsula without appreciable loss. Sir Charles was made commander of the 1st Army in France in 1916, and Commander-in-Chief in India the same year, serving until 1920. He received the rank of General in 1917. From Sept. 1923, until he retired in 1928, he was Governor and Commander-in-Chief at Gibraltar. He was created a Grand Commander of the Order of Bath in 1919, and 1st Baronet Monro in 1921. He died 7 Dec. 1929.

MONROE, Harriet, American author: b. Chicago, Ill., 23 Dec. 1860. She was graduated from the Visitation Academy, Georgetown, D.C., in 1879 and has since devoted herself to literature. In 1889 she wrote the text of the cantata given at the opening of the Chicago Auditorium and in 1891 wrote by request of the committee the 'Columbian Ode' which was sung at the dedicatory ceremonies at the World's Columbian Exposition in 1892. She has published 'Valeria and Other Poems' (1892); 'John Wilborn Root—a Memoir' (1896); 'The Passing Show—Five Modern

Plays in Verse (1903); *You and I* (poems) (1914); *The Difference and Other Poems* (1924); *Poets and Their Art* (1926); *Chosen Poems, a Selection from My Book of Verse* (1935). In 1912 she established and became editor of *Poetry*.

MONROE, James, 5th president of the United States: b. Westmoreland County, Va., April 28, 1758; d. New York, N.Y., July 4, 1831. He served as a youth of eighteen in the Revolutionary forces, but he withdrew from army service in 1780, and as a student of law formed a connection with Thomas Jefferson, then governor of Virginia. The bond between the two men became a close one, and it was as Jefferson's protégé that Monroe entered politics.

After a year in the Virginia legislature, Monroe was elected in 1783 to the Congress of the Confederation where he served for more than three years. There he made himself particularly conspicuous by his strong support of the interests of the West and by his vigorous opposition to John Jay's proposal to waive American claims to the navigation of the Mississippi in exchange for a commercial treaty with Spain. He did not participate in the great constitutional convention of 1787, and, when elected a delegate to the Virginia ratifying convention of 1788, he was one of the leaders of the opposition to affirmative action. When once the Constitution was adopted, however, Monroe accepted the result, and almost immediately entered national politics. In 1790 he was elected a senator of the United States; in the Senate he represented the anti-Federalist point of view.

Partisanship, and partisanship of a rather invidious and violent kind, is characteristic of Monroe's career at this stage. This is clearly demonstrated in his mission to France in 1795 and 1796. In 1794 the George Washington administration nominated John Jay as minister to London, with a view to a settlement of the many outstanding difficulties with Great Britain. Monroe opposed the mission, and the president, with a view to holding the balance even between the great European rival nations, named him as envoy to France. At the very least, he behaved in this mission with singular imprudence. He made speeches which went beyond the bounds of diplomatic discretion; he gave assurances to the French government that he had no right to give; he criticized in private letters the administration which he served; and he even went so far as to assure the Directory that matters might go better after the next presidential election. He was finally recalled.

Monroe's errors nonetheless never lost him the confidence of his Virginia constituency. In 1799 he became governor of his state, and he held this post until 1802. Then came the famous diplomatic mission to France that resulted in the purchase of Louisiana. Monroe's role, however, in this purchase was really a subordinate one. He went to France to negotiate, along with Robert R. Livingston, the regular American representative, a treaty which would assure to the United States the navigation of the Mississippi and the island of New Orleans. Before Monroe arrived in Paris, the astonished Livingston had been offered, not the island of New Orleans, but all the vast territory which had just been ceded to France by Spain, and had signified his willingness to negotiate on this basis. Monroe, however, not only participated in the details of negotiation but

was ready to transcend his instructions and to associate himself with this bold and wholly unauthorized purchase. He deserves credit for this fact.

There were diplomatic frustrations ahead of him. He was sent to Madrid, Spain, after the completion of the French negotiations, to negotiate with the Spanish government with regard to West Florida, the title to which was ill-defined in the Louisiana treaty. There he was made to cool his heels for months, and accomplished nothing. His next mission was to London. In association with William Pinkney, he negotiated a treaty which made numerous concessions to Great Britain on the pending issues of neutral trade and hence was repudiated by the administration of Jefferson. He returned to the United States at a low point in his career and his attempt to rehabilitate himself politically as a presidential candidate in the campaign of 1808, ended in stark failure.

It argues greater strength in Monroe than appears on the surface that he was soon active again. He was elected governor of Virginia in 1811 and was shortly thereafter called by President James Madison to the office of secretary of state, an office which he held for six years. He was one of those who shared the rising feeling of resentment against British arrogance at sea and he appears to have written the report to the House of Representatives, on which the declaration of war of June 1812 was based. But early in the struggle he was ready to accept Russian mediation and he deserves some credit for the very able peace delegation that was sent abroad in 1813. He cannot be said, however, to have played more than a subordinate role in the negotiations that ended the war.

In the congressional caucus of 1816 Monroe was nominated by the narrow margin of eleven votes over his rival, William H. Crawford, and in the fall of that year was elected to the presidency. He was to be re-elected to that office virtually unanimously in 1820 in a period of depression and to leave office at the very height of his prestige. Those who depreciate him (and there have been not a few) will have to take account of the extraordinary culmination of his long public career.

Monroe began his administration by drawing about him one of the strongest cabinets in the history of the country. He rose above sectional prejudice in choosing John Quincy Adams, the atrabilious New Englander, as his secretary of state; and Adams is considered by most students of diplomacy the greatest of the American secretaries. He named his rival, Crawford, as secretary of the treasury. The brilliant John C. Calhoun took the war department, and William Wirt, one of the most eminent lawyers of his day, the attorney generalship. This remarkable team served throughout the two administrations without a break.

Monroe's theory of the presidency, the prevailing theory at the time, circumscribed his role. He did not conceive of himself as a legislative leader. He left legislation very largely to the Congress. Yet, when legislative issues came up to him, he met them, and he showed both firmness and flexibility. In the great debate on the Missouri Compromise he facilitated the final agreement by making it clear that he would refuse to sign any bill which did not admit Missouri as a slave state. At the same time, despite

doubts as to the constitutionality of the measure, which excluded slavery from the territory north of 36°30', he permitted it to become law.

On the much discussed question of internal improvements, he began by arguing that the Constitution did not empower Congress to carry out such improvements. But he recommended an amendment to cover the point, and in 1822 he so far modified his stand as to declare that Congress could appropriate money for any purpose if such appropriations were for the purposes of common defense and of general, not local, national, nor state, benefit. He signed the first harbor act in 1823 and the far more important Survey Act of 1824 which laid out an elaborate program for the future.

The great achievements of his administration were in the field of foreign affairs. The acquisition of Florida from Spain in 1819 was, it is true, largely the work of Adams. But Monroe supported his secretary in the negotiations and, in particular, he stood with the New Englander against the rest of the cabinet when in 1818 the impetuous General Andrew Jackson invaded Florida, jeopardizing the discussions then in progress. Monroe refused to rebuke Jackson and gave his approval to the strong stand taken by the secretary in the note to Spain of November 1818. It may well be that this stand actually facilitated the final outcome by convincing the slow-moving Spanish government that it had better make the best of a bad business and cede Florida before that province was wrested from it.

In the question of the Spanish colonies Monroe played an important role. He was, from the first, very sympathetic with the movement for independence in these colonies. He wished to recognize the new states at an early date but held his hand in order not to jeopardize the negotiations with Spain over Florida. When these negotiations were concluded, he acted. And he went further. When word came in the summer of 1823 that there was some danger of intervention by the continental European powers in the interests of Spain, he prepared the great document which bears his name, the Monroe Doctrine. It was he, not Adams, who took the initiative in warning Europe that any interference on the part of Old World states would be dangerous to our peace and safety. While the form of the annual message of December 2, 1823, in which this principle was laid down, was influenced in part by the secretary—in particular in the clear line which it drew between Europe and America—the initiative in this matter was the president's.

It is true that the brave words then penned were in part modified in 1824 when, in an exchange of notes with the Colombian government, Adams qualified the stand of the United States and made it clear that positive action might depend on an understanding with Great Britain. But the message itself became one of the most fundamental documents in the field of American foreign policy and the source of many renewed assertions of the principle which it laid down. Given the circumstances, and having regard in particular to the limited physical power of the United States in 1823, it was a very bold pronouncement indeed.

At the expiration of his second presidential term, Monroe returned to Virginia. He presided over the constitutional convention of 1828 where he opposed the widening of the suffrage, and showed very little interest in the question of

slavery. Shortly after he went to live with his daughter in New York, and there he died on July 4, 1831.

Monroe was by no means regarded as commonplace by his contemporaries. The longer his term of service, the greater became the number of his admirers. Jefferson and Madison, Calhoun, Thomas Hart Benton and Adams, all spoke in praise of him, and perhaps it should be said of the last of these men that praise from Adams was praise indeed. Monroe was never a brilliant man. But he grew with responsibility, and his years in the presidency exhibited sound judgment and genuine statesmanship. No mere mediocrity could have left behind so many favorable judgments from so many persons of diverse views and temperament. Not, perhaps, a great president of the United States, he must be regarded as one of the most useful and successful. See also MONROE DOCTRINE, THE.

DEXTER PERKINS,
John L. Senior Professor of American Civilization,
Cornell University.

MONROE, Paul, American educator: b North Madison, Ind., June 7, 1869; d. Garrison, N. Y., Dec. 6, 1947. He graduated from Franklin College in Franklin, Indiana, in 1890 and received a Ph.D. degree from the University of Chicago in 1897, in which year he became a history instructor at Teachers College, Columbia University. He was professor of education there from 1902 to 1935, director of the School of Education (1915–1923), a founder and president of the China Institute in America, and president of Robert College and the American College for Girls in Istanbul, Turkey (1932–1935). A world renowned authority on the history of education, he edited the *Cyclopedia of Education* (5 vols., 1910–1913).

MONROE, mûn-rô, rural town, Connecticut, in Fairfield County, ten miles north of Bridgeport, on the Housatonic River. Settled about 1775, it was incorporated in 1823. Its government is by town meeting. Pop. (1950) 2,892.

MONROE, city, Georgia, in Walton County, 46 miles east of Atlanta; altitude 950 feet. It is served by the Georgia Railroad. The products of the surrounding agricultural area are cotton, corn, poultry, dairy and beef cattle. Manufactures include cotton cloth, work garments, fertilizer, cottonseed oil, and brooms. First settled in 1818, the city was incorporated in 1821. The government is by mayor and council. Pop. (1950) 4,560.

MONROE, city, Louisiana, and Ouachita Parish seat, altitude 82 feet, on the Ouachita River, 75 miles west of Vicksburg, Miss. It is served by the Missouri Pacific, Illinois Central, Arkansas and Louisiana Missouri railroads, and the Delta Air Lines. It is 97 miles east of Shreveport by rail. There is also water transportation via the Ouachita River.

With agricultural surroundings, the city stands also in one of the largest natural gas fields in the United States (discovered in 1916). Forests are nearby and lumber milling is an important industry. Manufactures include carbon black, chemicals, paper, paper bags, oak flooring, cooperative products, awnings, cottonseed oil, brick and tile.

The first settlement in 1785 was called Fort Miro. The name was changed to Monroe in 1818. Incorporated as a city in 1900, it is governed by a commission. Pop. (1950) 38,572.

MONROE, city, Michigan, and Monroe County seat, on Lake Erie at the mouth of the Raisin River, 41 miles southwest of Detroit, 18 miles north of Toledo, Ohio. It is served by the Detroit and Toledo Shore Line, the Michigan Central, New York Central, Pennsylvania, Chesapeake and Ohio, and Pere Marquette railroads. The harbor is one of the most modern on the Great Lakes.

Monroe is in a fertile farming region and is an important distributing point for a large section of the southeastern part of the state. Its manufactures are varied. They include paper products, fiberboard, auto parts, filing equipment, and beverages. There are limestone quarries, fisheries, and nurseries nearby.

When first settled (about 1784) by migrants from Canada, the place was known as Frenchtown, and here on Jan. 22-23, 1813, the Battle of Raisin River took place (see **FRENCHTOWN, MICH., BATTLE OF**). In 1815 the name was changed, in honor of President Monroe. It has been the county seat since 1817. The city was chartered in 1837 and the government is administered by a mayor and six commissioners, all elected officials. Pop. (1950) 21,467.

MONROE, city, North Carolina, and Union County seat; altitude 595 feet; 25 miles southeast of Charlotte; on the Seaboard Air Line Railroad. It is in a diversified farming area. Products include small grains, dairy and beef cattle, poultry, and cotton. Manufactures include small garments, cotton yarn, fertilizer, brick and tile, cottonseed oil, and hosiery.

Marshal Ferdinand Foch of France visited the city on Dec. 9, 1921, to decorate the colors of the 5th and 17th Field Artillery regiments from Fort Bragg with the fourragère of the Croix de Guerre. Settled in 1751, the city was incorporated in 1844. It has city-manager government. Pop. (1950) 10,140.

MONROE, city, Wisconsin, and Green County seat, altitude 1,040 feet, on the Chicago, Milwaukee, St. Paul and Pacific, and the Illinois Central railroads, 35 miles south-southwest of Madison. Located in the midst of a rich dairy-farming region, the city distributes for the farmers millions of pounds of butter and cheese annually, and ships quantities of condensed milk. Swiss immigrants, a colony sent out by the Canton of Glarus, brought to the Green County dairy-farm region the art of making Swiss cheese, and later comers introduced other varieties.

Monroe's notable buildings are the Masonic Temple, the courthouse, and the public library. Monroe was incorporated as a village in 1840, as a town in 1855, and as a city in 1882. It has mayor and council. The water supply system is municipally owned. Pop. (1950) 7,037.

MONROE DOCTRINE, The. The Monroe Doctrine was first enunciated by President James Monroe in his message of Dec. 2, 1823; but it owes its origin to ideas which go back considerably further in time, and in particular to the idea that the interests and ideals of the New World are different from those of the Old. This conception is to be found in some of the writings of the Revolutionary period; it is implicit and explicit in George Washington's famous Farewell Address which warns against close political association with European states, and again in the language of Thomas Jefferson's first inaugural; it possessed indeed a striking validity at a time when most of Europe was monarchical and reactionary, when American institutions represented, as they did, new tendencies toward republicanism and democratic liberalism, and when the breadth of a great ocean made for the separateness of the United States from Europe. What may be described as American isolationism was already well developed when Monroe sent to Congress his famous message.

The Monroe Message.—The message consisted of two different pronouncements. The first of these grew out of a controversy with Russia with regard to the northwest coast of America. The Russian government had in 1821 promulgated a ukase closing that coast to the commerce of other nations and forbidding the ships of such nations to approach within one hundred Italian miles of the shore. This decree was contested by the United States. In the course of the negotiations Secretary of State John Quincy Adams, who had long been a vigorous opponent of colonialism, declared that "the American continents, by the free and independent condition which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European powers." This phrase was taken over by the president and incorporated in his annual message of Dec. 2, 1823.

The second part of the message related to the former Spanish colonies in America. These colonies had revolted in the second decade of the century, and their independence had been recognized by the United States. In the summer of 1823 word arrived in Washington that the European powers might hold a congress on the colonial question, a congress which, if it followed previous European precedents, might result in armed intervention. At the same time the language of Czar Alexander I occasioned some concern. The British government had made overtures to Richard Rush, the American minister, suggesting a joint declaration on the whole problem. The matter was debated at length in the cabinet meetings of November 1823. Monroe, acting on his own initiative, drafted a statement in his message which declared, with regard to the former Spanish colonies, that "we [the United States] could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States." The warning, we now know, was unnecessary, since no aggressive designs existed. But it needed considerable courage to pronounce it, and to do so without waiting for any understanding with Great Britain.

The message of December 1823 was received with much acclaim in the United States, and with natural resentment and perhaps contempt (con-

sidering the meager basis of military and naval force on which it rested) by European powers. In the years immediately following 1823, the Monroe administration resolutely refused to transform it into an alliance with any South American state, though on four occasions appeals came to do so. Moreover, when in 1826 the question of sending delegates to the so-called Panama Congress arose, a congress projected by Simón Bolívar with regard to closer cooperation between the American republics, opinion in the United States was seen to be emphatically hostile to any political understanding. For a time, indeed, Monroe's message—after all, relating to a specific and immediate problem—seemed hardly likely to become a great American diplomatic principle. It was largely ignored for almost two decades. In the 1840's the situation changed.

Its Application in the 1840's.—The intrigues of Great Britain and France to prevent the annexation of Texas to the United States, the quarrel with Great Britain over Oregon, and the fear of British purposes in California led in the 1840's to the revival of the pronouncement of 1823. President James K. Polk gave the most striking, though by no means the first, expression of this revival in the message of Dec. 2, 1845, in which he warned not only against armed intervention but also against diplomatic intervention based on the principle of the balance of power, and at the same time stressed the special applicability of the Monroe Doctrine to North America.

The Polk message was well received, but like that of 22 years before, it was not accorded congressional sanction and produced little effect abroad. In 1848 the president reiterated his statement, suggesting that the Monroe principle forbade the assumption by England or Spain of a protectorate over Yucatan, and might lead to American control of that province. Here for the first time the dogmas of 1823 became the excuse for a proposed measure of expansion. No action was taken, however.

The president's proposal with regard to Yucatan led to a great debate in which John C. Calhoun, a member of the Monroe cabinet in 1823, took strong grounds against erecting into an absolute principle what he declared was a specific declaration aimed at an immediate and present danger a quarter of a century before. This tendency to avoid commitment to a doctrine was further exemplified in the attitude of the Whig administrations of Zachary Taylor and Millard Fillmore towards the British claims of sovereignty in Central America. In the negotiations which culminated in the Clayton-Bulwer Treaty of April 19, 1850, the name of Monroe was never mentioned, though the treaty bound the British government to abstain from further colonization in the area of Central America.

The Doctrine as National Dogma.—But such a position could not be long maintained. When new controversies arose under the pact, the Democrats proceeded to invoke the Monroe Doctrine, and in the negotiations of the 1850's, which terminated in new agreements at the end of the decade, the message of Monroe was gradually elevated, not into a partisan, but into a national dogma. It is in this period that the word "doctrine" first appears; and both parties now paid tribute to it. Moreover, it began to become known abroad; and though Lord Clarendon, the British foreign secretary, refused to admit its validity when it was brought to his atten-

tion, it was dealt with more respectfully by so eminent an Englishman as Benjamin Disraeli.

The period of the Civil War saw the Monroe Doctrine sharply challenged. In the spring of 1861, Spain reasserted its sovereignty over the Dominican Republic in the Caribbean. Secretary William H. Seward at once invoked the Monroe principle in a blustering note, and received a sharp rebuff. With the victory of Northern arms, however, and with the disastrous failure of Spanish arms in the new Spanish colony, the tone of the government in Madrid changed, and evacuation took place in 1865.

Still more dramatic and fundamental was the course of events in Mexico. Taking advantage of the divided Union, the Emperor Louis Napoleon managed to set up in Mexico an imperial government under the Austrian Archduke Maximilian. In this case Seward again left no doubt of the displeasure felt by the United States. But, taught by his earlier experience, he did not invoke the Monroe Doctrine by name, and indeed maintained a rather suave opposition until the victory of the North freed his hands.

With the close of the Civil War, the sentiment for the invocation of Monroe's dogma grew by leaps and bounds. The situation might have been a ticklish one, but Secretary Seward handled it with superb address. He was aware of the opposition in France to the Mexican enterprise, and of the strain which it imposed on French finances. He was aware, too, of the heroic resistance of the Mexicans themselves. In a series of skilful diplomatic notes, he raised his tone bit by bit, and at one and the same time succeeded in preventing any rash action at home while he increased the pressure on the government in Paris. By the end of 1865 it was apparent that the French would withdraw from Mexico. There can be no question that the attitude of the United States caused the French much anxiety, and contributed in some degree to the eventual decision. To the American people the outcome of the Mexican imbroglio was the vindication of the principles of 1823.

Once rooted as national dogma the doctrine was more and more liberally interpreted, often in ways which would have seemed strange to Adams and Monroe. Before 1870 attempts had been made to link the idea of non-intervention by Europe in American affairs with the principle that territories in the New World could not be transferred from one European power to another, but this principle was most definitely asserted and most closely connected with the Monroe Doctrine in the pronouncement of President Ulysses S. Grant in 1870 when urging upon the Senate the annexation of Santo Domingo. Thereafter it was repeatedly brought forward when cessions of territory were imminent, though it appears to have passed unnoticed at the time of the cession of the little island of St. Bartholomew by Sweden to France.

In the late 1870's and early 1880's the Monroe Doctrine was frequently cited as forbidding the construction by European powers of a trans-Isthmian canal across Panama, and still more as implying that any such a canal must be under the exclusive guaranty of the United States. Presidents Rutherford B. Hayes and James A. Garfield both insisted upon this point; and in the course of time American opinion compelled the repeal of the Clayton-Bulwer Treaty of 1850 (which looked towards joint British and American control of any canal constructed) by the signing of the

second Hay-Pauncefote Treaty (1901), by which Great Britain conceded the American point of view.

A still more extraordinary extension of the original doctrine was made by Grover Cleveland in his second administration when, in the name of Monroe, he demanded (1895) that the British government arbitrate a dispute with Venezuela over the boundary between that country and British Guiana, and threatened to appoint a commission to determine the line if the British did not accept his demand. This extreme position naturally provoked severe criticism across the seas, and for a time the situation was a touchy one. But on both sides of the Atlantic a more pacific sentiment prevailed, and the matter was finally settled by an arbitration agreement, the terms of which virtually conceded to Great Britain in advance much of what she claimed. It is to be noticed that in the course of this dispute Lord Salisbury, the British foreign secretary, flatly denied, in a note to the American government, that the Monroe Doctrine was, in any sense, international law.

The Venezuela Blockade of 1902.—The turn of the century saw a new and interesting development of the principles of 1823. Down to this time, these principles had never been invoked to prevent an Old World state from taking punitive action against a New World state considered guilty of wrongdoing. But in the Venezuela blockade of 1902 by Great Britain, Germany, and Italy—a blockade which, despite assertions to the contrary, may be said to have been undertaken without any thought of territorial aggrandizement—American public opinion asserted itself strongly. In the face of this public opinion British statesmen, both of the ministry and of the opposition, for the first time recognized the validity of the Monroe Doctrine. The German government was less adroit; it had to deal with its own nationalists, who were in general venomously antagonistic to the principles of 1823. It made no such obsequence as did the British, and this fact may well have had an influence over the future course of events and have helped to fix in the American mind a prejudice against the Reich which was to be a powerful factor when war broke out in 1914.

The Venezuela blockade had important effects in the United States. President Theodore Roosevelt had originally consented to the blockade by the allied powers for the purpose of collecting debts which Venezuela owed their nationals; but he became very nervous before an arrangement was made, and as a result he was soon to give a new twist to the Monroe Doctrine itself. Before commenting upon this it is worth while noting that the legend that Roosevelt compelled arbitration by threats of direct action directed against the German government has now been pretty well exploded. The dispute had hardly begun before it was put in the way of settlement.

The Roosevelt Corollary.—The area of major sensitiveness with regard to the principles of 1823 had always been the Caribbean and the Gulf of Mexico. Indeed, it is a striking fact that in every case where these principles were seriously invoked, a country in this particular area was involved. It is not strange therefore that what is now known as the Roosevelt Corollary to the Monroe Doctrine was first enunciated in regard to the Dominican Republic.

This little state had been a prey to almost constant internecine strife. It also had floated

various loans abroad, but had become bankrupt. There was thus a possibility that its distraught condition might provoke intervention by some European state. Anticipating such action, as early as 1904 in his annual message President Roosevelt stated that "chronic wrong-doing, or an impotence which results in a general loosening of the ties of civilized society" might, in the Western Hemisphere as elsewhere, lead to action by a strong power, and that, under the Monroe Doctrine, that power would have to be the United States.

Following out this theory, and perhaps bringing some pressure to bear upon the Dominican government, the president had negotiated an agreement for the control of the customs in the winter of 1905. The Senate balked, but Roosevelt went ahead on the basis of an executive agreement, and two years later the treaty was ratified. It set a precedent for others that were to follow.

The Roosevelt Corollary, in its first application, had resulted only in customs control. But it was soon to be carried further. The William Howard Taft administration negotiated a similar agreement and induced American bankers to make a loan to the Nicaraguan government. When its policy seemed jeopardized, marines were landed, and remained in occupation for more than a decade. In Haiti, where again American banking interests had been encouraged to take a part in the affairs of the republic, disorders and the fear of German or French action led towards intervention in 1915. In the Dominican Republic, the breakdown of government brought about American control in 1916. Thus the Roosevelt Corollary led on to direct military occupation of the territory of assumedly independent states.

The question of the Monroe Doctrine came up in connection with the drafting of the Covenant of the League of Nations at Paris in 1919. In order to placate domestic opposition President T. Woodrow Wilson found it necessary to incorporate in the Covenant itself an article declaring that nothing therein contained should affect the validity of "regional understandings" such as the Monroe Doctrine. The phrase used was a cloudy one, and it did not satisfy the president's American foes, who insisted upon further reservations to the peace treaty on the matter. That it was approved by the other signatories is, however, some indication of the increasing acceptance of the position of the United States.

The Doctrine had by this time become an object of suspicion and dislike rather than cause for gratitude in Latin America. As early as 1913, Hiram Bingham (the explorer) had suggested that it was an obsolete shibboleth. The statement was an extreme one, but it contained a germ of truth. The states of the New World were more afraid of interference on the part of the United States than they were of any action by Europe. American statesmen found themselves on the defensive in discussing the famous dogma. Secretary of State Charles Evans Hughes attempted to re-define it in terms that would remove apprehension and to justify American intervention, or interposition, as he preferred to call it, on other grounds. But the tide of opposition to American hegemony continued to swell throughout the decade of the 1920's, and it was particularly evident at the Pan American Conference of 1928. The course of events suggested a change in American policy.

The Clark Memorandum.—The withdrawal of the United States from the Dominican Republic in 1924 was a first step. But withdrawal from Nicaragua in 1925 was followed by a new intervention, and it was not until the Washington Conference on Conciliation and Arbitration in December 1928 that a really decisive move was taken in the famous Memorandum on the Monroe Doctrine (drafted by J. Reuben Clark) which definitely repudiated the Roosevelt Corollary. In January 1929 the Senate Committee on Foreign Relations, in transmitting the Kellogg-Briand pact for the outlawry of war, added a gloss, or separate report, in which the Monroe Doctrine was conservatively interpreted and based upon the principle of self-defense. In 1930 the Clark memorandum was transmitted to other governments, thus emphasizing the fact that it represented official policy.

But this was only the beginning, in a sense, for in 1933 at the conference of Montevideo, Secretary Cordell Hull put his name to a protocol which bound the United States not to intervene in the internal or external affairs of any American state. There was, indeed, a reservation to this pledge reserving the rights of the United States under international law. But in 1936 at Buenos Aires a new protocol was signed, this time without any qualification whatsoever. The connection of the principles of 1823 with a right of intervention was thus brought to an end.

The Doctrine and Collective Defense.—One hears relatively little of the Monroe Doctrine in the early 1930's. There existed in these years little danger to the status of the New World, and the prevailing tone of American policy, preoccupied as we were with internal concerns, reflected a certain indifference to questions of foreign affairs. But the rise of Adolf Hitler to power in Germany was to alter the situation materially. As a result there took place a process which has sometimes been called the internationalization of the Monroe Doctrine. The phrase is in a sense an inaccurate one, since there is no reason to believe that the American government would hesitate to assert alone and independently the principles of 1823 if it felt the necessity of so doing.

It is true, on the other hand, that measures were taken which looked to collective defense, and that these measures alter the context in which the doctrine would be invoked. Thus, for example, at the conference of Buenos Aires in 1936, an agreement was signed by the states of Latin America calling for consultation if they were threatened by any European power. In 1938, this agreement was supplemented by another, which provided for a meeting of the foreign ministers of the American states on the call of any one of them. Much more important measures were taken in 1940.

The fall of France naturally produced a strong reaction in the United States and led to the adoption of resolutions by both houses of Congress expressing opposition to the transfer of the European colonies of any power (France and Holland were of course meant) to any other power. The action of Congress was supplemented by the Conference of Havana, which drew up an elaborate scheme to meet the possible danger of any such transfer, and at the same time, going far beyond the no-transfer principle, declared that an attack on any one American power would be regarded as an attack on all. From these declarations were

deduced others. At Chapultepec in 1945, the principle of collective action in case of external attack was re-stated, and various measures enumerated which would be taken in case of aggression. At Rio de Janeiro in 1947, the Inter-American Treaty of Reciprocal Assistance stated unequivocally that aggression against an American state would, on the two-thirds vote of the representatives of the states, be met with sanctions of various degrees of severity. In the meantime, between the Chapultepec and the Rio meetings, the Charter of the United Nations had established a world organization based upon the idea of common action against a law-breaking state. The original purposes of the Monroe Doctrine had thus received a far wider than national sanction.

In the World War II period the Monroe Doctrine served a useful purpose in a way hardly thought of before. The establishment of a base for American troops in Greenland, a Danish colony, in the spring of 1941, for example, was related to the principles of 1823. Monroe would certainly have been surprised at any such application of his message.

Significant Generalizations.—What significant generalizations stand out with regard to the Monroe Doctrine? Fundamentally, in 1823 the president placed his warning to Europe on grounds of national security. Yet it is not easy to see that the safety of the United States would have been jeopardized by what took place, let us say, in Patagonia or in Chile. In extending his principle so far, the president perhaps might be said to have fallen a victim to that tendency to over-generalization which not infrequently has asserted itself in American foreign policy. In a sense, future statesmen were to recognize this fact. The practical application of the doctrine, as already mentioned, was almost invariably in the region of the Caribbean, where there were security interests of the most patent kind.

Were the dangers which the doctrine was designed to prevent real dangers? As already pointed out, there seems to have been no real peril in 1823. But British acquisitive instincts in the Caribbean in the 1850's did run counter to the interests of the United States. So, too, did Napoleon III's activities in Mexico. After the American Civil War there was never a moment when there was serious danger of European aggression with an eye to conquest against an American state. European colonial ambitions were satisfied elsewhere, especially in Asia or in Africa. There were Germans, no doubt, especially German naval men, who dreamed of bases in the New World and of the extension of German influence. But the German Foreign Office was extremely cautious in the first years of the 20th century, and the danger from Germany was temporarily extinguished by the events of World War I. In the 1930's and the 1940's Adolf Hitler had objects of ambition other than Latin America.

Was the Monroe Doctrine gratefully accepted by the states to the south? To some extent, and in some specific instances, yes. It was certainly invoked by some of them when it served their interests. But, after the end of the 19th century, it was as often associated with American hegemony as with American benevolence. In this context it was an object of concern rather than a matter for admiration. Yet the principle at its base was sound, and it has been more and fully recognized in the association of the states of the New World together in the war against Hitler.

and in the compacts which have followed that war. Were a real danger again to arise, in terms of actual physical aggression, it would undoubtedly once more figure prominently.

Finally, the Monroe Doctrine illustrates a general tendency that seems to inhere in American diplomacy. This tendency is towards large and sweeping generalization which captures the imagination of the mass of the people and has the advantage of being easily assimilated and of easily becoming a focus for popular support. The task of statesmanship is to relate such generalization to the actual interests of the United States. As this sketch demonstrates, the task has been well performed. In its various manifestations, the Monroe Doctrine has usually been wisely and profitably applied. It has given a broad popular and, in a sense, a broad moral basis to the specific objectives of American diplomacy. See also UNITED STATES—38. *United States Diplomacy Relations with Spain and the Monroe Doctrine*.

DEXTER PERKINS,
John L. Senior Professor of American Civilization,
Cornell University.

MONROVIA, mŭn-rŏ'vi-à, city, California, situated in Los Angeles County, at an altitude of 560 feet, 9 miles east of Pasadena, on the Atchison, Topeka and Santa Fe and the Pacific Electric railways. The surrounding area raises citrus fruit, poultry, and avocados, and the city has packing plants, as well as plants producing water heaters, lumber, paint, gloves, textiles, soap, and dairy products. Monrovia was named for W. N. Monroe, who laid out the city in 1886. It was incorporated in the following year. Government is of the city manager type, and the water supply system is municipally owned and operated. Pop. (1950) 20,186.

MONROVIA, seaport, Liberia, capital of the republic and seat of Montserrado County, situated on Cape Montserrado, just south of the mouth of the St. Paul River. The chief port of the country, it exports rubber, iron, palm kernels and oil, forest products, gold, and cassava. Industry is undeveloped. The town is the seat of Liberia College, founded in 1863, and of the College of West Liberia, and has Roman Catholic and Protestant missions and a general hospital.

Founded in 1822 by the American Colonization Society, Monrovia was named for James Monroe, fifth president of the United States. During World War II a harbor and submarine base were built on Bushrod Island; the harbor became a free port in 1948. Roberts Field, 30 miles east-southeast of the town, was also built during the war; it is used by United States, French, and Spanish airlines. Government is administered by a municipal board appointed by the president of Liberia. Pop. (est. 1952) 15,000.

MONS, môns (Flemish BERGEN), town, Belgium, capital of the province of Hainaut, situ-

ated on the Trouille River, 32 miles southwest of Brussels, at the junction of the Condé-Mons Canal and the Canal du Centre. To the southwest are the extensive coalfields of the Borinage, and the town is a shipping center for coal. It also processes sugar and produces leather goods, chemicals, and cotton and rayon textiles. The Collegiate Church of Ste.-Waudru was built in the Gothic style from 1450 to 1600. The town hall dates from 1443-1667, and a belfry with a large carillon from 1662.

Mons was made the capital of Hainaut by Charlemagne in 804. In the 16th, 17th, and 18th centuries it was often the scene of heavy fighting, and the battlefields of Malplaquet (1709) and Jemappes (1792) are nearby. In World War I, the British Expeditionary Force fought its first engagement here, on Aug. 23, 1914. Pop. (official est. 1948) 25,684.

MONSELICE, môn-sâ'lê-châ, commune, Italy, situated in Veneto, 13 miles south-southwest of Padua. It has plants producing shoes, jute, and agricultural implements and processing food. Overlooking Monselice are the ruins of a castle built by Emperor Frederick II in the 13th century, and there is a 13th century cathedral (restored in 1931). Pop. (est. 1951) 16,500.

MONSIGNOR, môn-sê'nyôr (Ital. *monsignore*, my lord), a title of honor given by the pope to domestic prelates of the Roman Catholic Church. It is abbreviated Msgr.

MONSIGNY, môn-sê-nyê' Pierre Alexandre, French composer: b. Fauquembergues, Pas-de-Calais, Oct. 17, 1729; d. Paris, Jan. 14, 1817. He went to Paris in 1749 and soon entered the service of Louis, duc d'Orléans, first as majordomo, and then as administrator of the duke's estates and inspector general of canals. After studying composition for a few months with Pietro Gianotti, he composed a series of 13 comic operas, the first of which, *Les Aveux Indiscrets*, was produced in Paris in 1759. During the French Revolution he lost his position and was impoverished, but in 1798 he was pensioned by the Opéra-Comique, and from 1800 to 1802 he served as inspector of instruction at the Conservatoire de Musique. In 1813 he became a member of the Académie des Beaux-Arts.

Monsigny was an excellent melodist, but his lack of training prevented him from being a great composer. Among his other works, all of which were highly popular, are *Le Cadi Dupé* (1761); *On ne s'Avise Jamais de Tout* (1761); *Le Roi et Le Fermier* (1762); *Le Déserteur* (1769), his best opera; *Le Faucon* (1772); and *Félix, ou l'Enfant Trouvé* (1777), his last work.

MONSON, mŭn's'n, Sir Edmund John, British diplomat: b. Seal, Kent, Oct. 6, 1834; d. London, Oct. 28, 1909. He was educated at Eton and at Balliol College, Oxford University, receiving his B.A. degree in 1855. In 1858 he was elected a fellow of All Souls College and received his M.A. degree. Entering the diplomatic service in 1856, he held various posts as attaché, under-secretary, and consul until 1876, when he was sent on a special mission to Dalmatia and Montenegro. He served as minister to Uruguay from 1879 to 1884, to Argentina and Paraguay in 1884, and to Denmark from 1884 to 1888. Monson was appointed arbitrator of the Butterfield claims be-

tween Denmark and the United States in 1888, Minister to Belgium 1892, Ambassador to Austria 1893, and to the French Republic 1896-1904. He was made a Privy Councillor in 1893. His decision in 1900, in favor of the action of the Danish authorities in 1854-55 at the island of Saint Thomas, disposed of the claims of the two American vessels belonging to Butterfield and Company. In 1903 he received the order of the G.C.V., and was knighted in 1905.

MONSOONS, mōn-soonz', in *meteorology*, are certain winds, operative from the tropic of Cancer to lat. 7° S., and from the coast of Africa through the Indian Ocean and the Bay of Bengal to Japan and the western Pacific. There are two monsoons, the southwestern and the northeastern. The latter prevails from October to April, and the former from April to October. Monsoons are caused by the unequal heating of the land and water and of the several land masses themselves in the regions which they affect. Independently of their great use in bringing rain to countries which otherwise would degenerate into deserts, they are useful for navigation. As in the case of the trade winds, navigators of sailing vessels plan their voyages to take advantage of the monsoons. Consult Ferrel, W., 'A Treatise on the Winds' (New York 1889).

MONSTERS. See **TERATOLOGY**.

MONSTRANCE (Lat., *monstrare*, to show), called also *ostensorium* or *expositorium*, the sacred vessel in which, in the Roman Catholic Church, the host is shown to the people, through a glass-covered opening, at benedictions, processions and other solemnities. Its use dates from the institution of Corpus Christi Day (1264) by Pope Urban IV. It was not until after the Council of Cologne 1452 that the consecrated wafer was exhibited to the people, having been previously deposited in the ciborium which enclosed and concealed it.

MONSTROSITY. In anatomy and physiology any deviation in form or function so great as to be noticeable may be termed a monstrosity by the extension of the term. But it is customary to consider as true monstrosities only such deviations from the normal as are excessive. Supernumerary fingers, toes, legs, arms, etc., or the absence of any or all of them from birth are not called true monstrosities. Deviations from the normal in form or function are almost limitless, the study of them being otherwise known as teratology. The subject of human teratology has been systematized by Saint Hilaire and slightly modified by Hirst and Piersol and is as follows: (1) Hemiterata are all abnormal developments which are not true monstrosities, lacking the element of excess, with the exception of excess in numbers referred to. They include, however, anomalies in size such as dwarfs and giants, anomalies in form of head, pelvis, etc., of color such as albinism or melanism, of position, including curvature of the spine, hernia, clubfoot, etc., of continuity, including imperforate esophagus, rectum or vagina. (2) Heterotaxes, which include the anomalous position of heart, liver, etc. (3) Hermaphrodites, which according to the definition of Ahlfeld are those individuals which possess sexual glands both masculine and feminine, but show all possible variations

of one sex organ upon the other. (4) True monsters, where there are either more or less than the normal number of legs, arms or there are no heads or rudimentary heads or two or more. This group also contains what are called omphalositic monsters which are embryos attached to an original foetus and depending on it for what nourishment and development they can get. The best-known type of monsters, those which have been frequently exhibited, are the composite monsters of which the Siamese Twins and the Tocci Brothers are examples. Other illustrations are of children with two bodies joined together at the pelvis but having no legs, and the bodies pointing in opposite directions. There are also terata with two heads and two faces or with one head and two faces like the ancient conception of the god Janus.

It is almost impossible to imagine any deviation in form, function or size which has not been recorded, since the curiosity of mankind has been such as to be attracted from time immemorial to anything in the nature of the marvelous. The composite monsters on record have shown almost all varieties of union of lower extremities and of reduplication of both lower and upper; and of the partial or total reduplication of the entire body, the climax being reached in the twins which are united by only a comparatively small cartilage. Double monsters are either parasitic or independently nurtured as was the case of the Siamese Twins, who lived to the age of 63 years. There are also known triple monsters, one case being recorded by Saint Hilaire of a three-headed child who was born in Italy in 1832.

The very unpleasant side of anatomic teratology has its more cheerful compensation in the records of extraordinary developments in vitality and fecundity and in the recovery of many persons who have suffered accidents or other misfortunes ordinarily found fatal, or who have shown remarkable abilities of adaptation to apparently impossible conditions. For not only do we see the monstrosities of fatness and leanness, the people with elastic skin, the bearded women, etc., but there have been recorded a large number of cases of extraordinary ability to function in spite of adverse circumstances. Examples of teratology of function are seen in suspended animation, a case being recorded of a man who could, apparently at will, cause his heart to stop beating. He succeeded once in prolonging this inactivity of the heart for about 30 minutes. The function appeared to be restored automatically. A post mortem examination of his heart showed nothing extraordinary. Other illustrations of purely physiological wonders without, however, showing any other abnormality are seen in very high temperature. One case is on record of a man whose temperature ran up to 148° and was between 120° and 125° for five days in succession.

Among anomalies of excess in function are to be included also mental prodigies such as extraordinary memory and other mental functions of which one of the most remarkable was Jacques Inaudi born in 1869 in Piedmont. He had an extraordinary mathematical ability which enabled him to perform mentally operations with numbers in the billions and trillions

MONT, *môn*, a French word meaning "mountain," found in many place names.

MONT-DE-MARSAN, *mônd-mâr-sân'*, town, France, capital of the Department of Landes, situated 66 miles south of Bordeaux, at the confluence of two small rivers, the Midou and the Douze, which here form the Midouze. The trade and shipping center of a lumbering area, the town produces furniture, pit props, turpentine, and wax, and has metalworks and meat-preserving plants. There are the ruins of a 14th century donjon. Once the seat of the viscounts of Marsan, the town became part of Béarn in 1256. It was united with the French crown in 1589, on the accession of Henry IV. Pop. (1946) 11,929.

MONT-DE-PIETE, *môn-dê-pyâ-tâ'* (from Ital. *monte di pietà*, bank of pity or piety), a public pawnbroking establishment which lends money on pledges at a low rate of interest, and whose primary aim is philanthropic. *Monts-de-piété* are found in France, Italy, and other Continental countries, but not in Great Britain or the United States, where pawnbroking is a private enterprise.

The development of *monts-de-piété* arose from the need of providing some means whereby poor persons could obtain loans at moderate charges on pledges for which private lenders exacted usurious rates of interest. The first such establishment was founded by the Franciscans in Perugia, Italy, in 1462. By the end of the 16th century the movement had spread to many other Italian cities, notably Turin (1519) and Rome (1539), as well as to Avignon (1577) in France, Nürnberg (1498) in Germany, and Bruges (1572) in Belgium. The sanction of the Roman Catholic Church was given to the new institutions by the 5th Lateran Council in 1515. The principal French *mont-de-piété*, that of Paris, was not founded until 1777. It was closed for a time during the French Revolution, but its monopoly was restored by Napoleon I in 1806. See also GOVERNMENT PAWNSHOPS IN FRANCE; PAWN-BROKERS.

MONT-DORE, *môn-dôr'* (also known as MONT-DORE-LES-BAINS and LE MONT-DORE), town, France, situated in the Department of Puy-de-Dôme, at an altitude of 3,445 feet, on the Dordogne River, 19 miles southwest of Clermont-Ferrand. The town lies at the foot of the Puy de Sancy in the Monts Dore of the Auvergne Mountains, and is a center of winter sports. Its thermal springs, known since Roman times, attract many summer visitors. Pop. (1946) 2,165.

MONT JOLI, *môn zhô-lê'*, town, Quebec, Canada, situated in Rimouski County, near the south bank of the St. Lawrence River, 18 miles east-northeast of Rimouski. It is served by the Canada & Gulf Terminal and the Canadian National railways, and has an airport. It is also the starting point and terminus of the scenic highway which runs around the Gaspé Peninsula. The distributing center for a mixed farming and lumbering district, the town has railroad shops and establishments producing aerated waters and metal, wood, and dairy products. Mont Joli has a high school, a college, a convent, and a sanatorium. Pop. (1951) 4,938.

MONT LAURIER, *môn lô-rî-â*, town, Quebec, Canada, seat of Labelle County, situated

at an altitude of 733 feet, on the Lièvre River, 164 miles by rail northwest of Montreal. It is the terminus of a branch of the Canadian Pacific Railway extending from Montreal. The town lies at the foot of Mount Sir Wilfrid in the Laurentian Highlands and is a center of winter sports. There are deposits of mica in the vicinity, as well as good agricultural land devoted largely to the raising of oats, hay, potatoes, and dairy cattle. Near the town is a provincial experimental farm. A large plywood and veneer factory and several sawmills are the leading local industrial establishments.

Founded in 1915, Mont Laurier is the seat of a Roman Catholic bishopric and has a seminary affiliated with Laval University, a classical academy, two convents, the Hôpital Ste. Anne, and a weekly newspaper. Pop. (1951) 4,701.

MONT-SAINT-MICHEL, *môn-sân-mê-shêl'*, rocky islet, France, situated in the Department of Manche, on the English Channel, 8 miles southwest of Avranches. A famous seat of learning and pilgrimage resort of Normandy as early as the 12th century, it is now an equally celebrated tourist resort. It consists of a collection of medieval houses, inns, ecclesiastical buildings, and fortifications, grouped on a conical rock 164 feet high and 3 acres in area, in the Bay of St.-Michel or Mont-St.-Michel, at the mouth of the Couesnon River, which here forms the boundary between Normandy and Brittany.

Once a lofty hill in the Forest of Scissy, which was submerged in the 7th century A.D. by a tidal cataclysm, the rock in prehistoric times was crowned by a Celtic temple. It was the Roman Mons Tumba and the *mons in periculo maris* (mount in danger of the sea) of the monastic chroniclers. The Bay of St.-Michel, 15 miles wide at its mouth and 8 miles long from north to south, is nearly dry at low water, but fills with treacherous rapidity at flood tide. In 1875 a dike nearly a mile long was built to connect the rock with the mainland.

Ramparts, towers, and bastions encircle the base of the rock, which has a circuit of about 2 miles, and entrance is made through a gate which opens on a single, narrow, winding street of a small village (pop. 1946, 149) built around the southern slope. The street leads by several flights of stone steps to a fortified abbey on the summit. Crowning the abbey is a church with a 12th century Romanesque nave, a Flamboyant Gothic choir built in 1450-1521, and a façade added in the 18th century. Capping its spire is a statue of St. Michael, which towers conspicuously 256 feet above the wide expanse of sandy bay and low-lying country around.

The abbey was founded in 709 by St. Aubert, bishop of Avranches, and his first chapel, which has been restored, stands on a rocky projection on the north side of the rock. In 1203 the abbey was destroyed by King Philip II (Philip Augustus), and the present buildings were erected between that year and 1264. Mont-St.-Michel was a strategic fortified post during the Hundred Years' War and during the religious wars of the 16th century. It was successfully defended against all assaults by the Order of St. Michael, which was founded in the Hall of Knights of the abbey in 1469. In the 18th and first half of the 19th centuries the fortress served as a prison for political offenders.

Mont-St.-Michel is now one of the protected

historical monuments of France. An elaborate process of restoration after 1863 renewed its ancient strength and beauty. Among the chief features of the Mont are the abbey church, elaborately decorated cloisters, La Merveille, "the marvel," or massive north wall of the abbey, the Salle des Chevaliers, the Châtelet or guardhouse, the crypts with their remarkable columns, the cellars, the dungeons, and the medieval elevator with its enormous hoisting wheel formerly operated by a donkey; and in the village, the ancient parish church, and museum.

MONTAGNA, Bartolommeo, môn-tă'nyă, Italian painter: b. Orzinovi, near Brescia, about 1450; d. Vicenza, Oct. 11, 1523. He settled at Vicenza in 1480, and worked in Padua and Verona; and from 1496 until his death he was again in Vicenza, being the first great master resident there. His work in general resembles the earlier Venetian school, was serious, marked by distinctness, power and severity of drawing, and had harmonious coloring in which a brown gleaming tint was noticeable. The human form was almost always shown as over-muscular. His principal works were the *Madonna and Child* at the Venice Academy, *Ecce Homo* at the Louvre, frescoes in the church of San Nazaro at Verona and an altar piece in the Brera, Milan. In the Johnson collection at Philadelphia he is represented by a *Madonna with Saints* and in the New York Metropolitan Museum by *A Lady of Rank as Santa Bibiana* and a *Madonna and Child*.

MONTAGNAIS (môn-tăn-yă) **INDIANS**, a general name applied to several American Indian tribes. One of these, of the Athapaskan family in British North America, were Christianized by Roman Catholic missionaries. Another and best-known tribe of this name was of the Algonquian family, and resided along the shores of the Saint Lawrence River. They have practically disappeared in recent years.

MONTAGNARDS, môn-tăn-yăr (Fr. *mountaineers*), a popular name in French history, applied in 1793 to the radical democratic party, the leaders in the French Revolution and its excesses. Soon after the fall of Maximilien F. M. I. Robespierre (q.v.) the denominations of "Montagnard" and "Montagne" gradually disappeared from party nomenclature. After the Revolution of 1848 an abortive attempt was made by the extreme party in the National Assembly, under Jean Joseph Louis Blanc (q.v.), to revive the title.

MONTAGU, Charles, EARL OF HALIFAX, English statesman and poet: b. Horton, Northamptonshire, April 16, 1661; d. May 19, 1715. He first attracted notice by his verses on the death of Charles II; and in 1687, in conjunction with Matthew Prior (q.v.), wrote *The Town and Country Mouse*, a parody on *The Hind and Panther*, by John Dryden (q.v.). He was a member of the Convention Parliament of 1689 and supported the claim of William III to the crown. He became a lord of the treasury in March 1692; in 1694 was made chancellor of the exchequer; in 1695 carried out the much-needed recoinage, appointing Newton warden of the mint; and in 1696 he devised the system of exchequer bills. His administration was distinguished by the adoption of the funding system, and by the establishment of the Bank of England. In 1700 he was raised to the peerage, under

the title of Baron Halifax. In the reign of Anne he remained out of office, but he actively exerted himself to promote the union with Scotland, and the Hanoverian succession. He was first lord of the treasury on the accession of George I, who created him an earl, and bestowed on him the Order of the Garter. The *Life and Miscellaneous Works of Lord Halifax* were published in 1715, and his poems were included in the edition of *English Poets* by Samuel Johnson (q.v.).

MONTAGU, Edwin Samuel, British statesman: b. Feb. 6, 1879; d. London, Nov. 15, 1924. He was under secretary for India under Lord Morley, 1910, and his first budget speech a few months later in the House of Commons created a highly favorable impression. Early in 1915 he entered the Cabinet as chancellor of the Duchy of Lancaster. He was minister of munitions in the first Coalition government, but retired with Prime Minister Herbert Henry Asquith (q.v.) when a new government was formed by David Lloyd George (q.v.). When Austen Chamberlain (q.v.) resigned the Indian secretaryship in the summer of 1917, Montagu was chosen for the post. He proceeded to India to investigate the political situation of the country, in association with the viceroy, Lord Chelmsford, with a view to the gradual development of self-government for India. In July 1918 the "Montagu Chelmsford Report" on Indian constitutional reforms was issued. In the new Lloyd George Cabinet of January 1919 Mr. Montagu was re-installed secretary for India; he retained this portfolio until his resignation in 1922, forced by indiscreet publication of the views of the Indian government respecting Turkey.

MONTAGU, Elizabeth Robinson, English author and society leader: b. York, Oct. 2, 1720; d. London, Aug. 25, 1800. In 1742 she married Edward Montagu, grandson of the first earl of Sandwich, who died leaving her a fortune. To wealth she added literary accomplishments, and these, joined to other personal qualities, enabled her to secure her social leadership. Among her visitors and associates were Lloyd Lyttelton, Samuel Johnson, Horace Walpole, Edmund Burke, Sir Joshua Reynolds, David Garrick, Hannah More (qq.v.), and other celebrated persons. To the gatherings at her house the term blue-stocking (q.v.) is said to have been first applied. Three of the dialogues in Lord Lyttelton's *Dialogues of the Dead* were written by her in 1760. She also wrote an *Essay on the Writings and Genius of Shakespeare, compared with the Greek and French Dramatic Poets* (1769). Much of her correspondence was published (1809-13).

MONTAGU, John, 4TH EARL OF SANDWICH. See SANDWICH, JOHN MONTAGU, 4TH EARL OF.

MONTAGU, Lady Mary Wortley, English author: b. London, May 1689, d. London, Aug. 21, 1762. She was the eldest daughter of Evelyn Pierrepont, afterward Duke of Kingston. She learned Latin very early, and also became versed in English literature, especially its romance and drama. The Kit-Cat Club (q.v.) by acclamation admitted her to membership. In 1712, without the consent of her father, she married Edward Wortley Montagu, a wealthy Whig scholar, with whom the former had quarreled. On the accession of George I in 1714 Montagu ob-

ained the position of commissioner of the treasury, and the Montagus went to live in London, where Lady Mary's beauty, wit, and vivacity won her a wide circle of friends, among them Alexander Pope. Her *Letters* (1716) appeared in a pirated edition under the title of *Court Poems* in 1716. In the same year her husband was appointed ambassador to the Porte. Lady Mary accompanied him to Constantinople, where they remained from May 1717 to June 1718. It was during this period that her celebrated *Letters from the East* were written. In Adrianople she earned of the Turkish practice of inoculation against smallpox, and she had her son inoculated. On her return to England she introduced the practice in the face of violent opposition. Resuming her friendship with Pope, she and her husband settled in Twickenham. In 1722, however, she quarreled with the poet, who frequently satirized her thereafter, and she was also attacked by Jonathan Swift in a lampoon published in 1727. In 1739, for reasons never satisfactorily explained, Lady Mary left England to live on the Continent, chiefly in Italy, where she remained until after her husband's death in 1761. Her relations with her husband apparently remained friendly, and she corresponded frequently with her daughter, the countess of Bute. Returning to England early in 1762, she died shortly thereafter.

Lady Mary's letters are marked by wit, graphic power, keen observation, and independence of judgment. They were published in a three-volume edition in 1763. Her great-grandson, the 1st Baron Wharnccliffe, edited a three-volume edition of her *Works* in 1837.

Consult Benjamin, L. S., *Lady Mary Wortley Montague Her Life and Letters* (Boston 1925); Barry, Iris, *Portrait of Lady Mary Montague* (Indianapolis 1928); Cove, J. W., *Admirable Lady Mary; the Life and Times of Lady Mary Wortley Montague, 1689-1762* (New York 1949).

Her son, EDWARD WORTLEY MONTAGU (1713-1776), was a writer and traveler. He published *Reflections on the Rise and Fall of the Ancient Republics. Adapted to the Present State of Great Britain* (1759).

MONTAGU, Ralph, 1st DUKE OF MONTAGU: b. about 1638; d. March 9, 1709. The son of the 2d Baron Montagu of Boughton, he obtained preferment at the court of Charles II, and in 1669 was appointed ambassador extraordinary to Louis XIV. He became a member of the Privy Council in 1672, and in 1676 was again named ambassador to Louis XIV. In this capacity he helped to arrange English neutrality in the war between the Netherlands and France. Because of political intrigues, he lost his positions in 1678, but as an early supporter of William of Orange was reappointed to the Privy Council in 1689, and in 1705 was created marquis of Monthermer and duke of Montagu.

MONTAGUE, Charles Edward, British journalist and writer: b. London, Jan. 1, 1867; d. Manchester, May 28, 1928. Of Irish parentage, he was educated at Balliol College, Oxford University (1885-1889), and in 1890 joined the staff of the *Manchester Guardian*, with which, except for his service (1914-1919) in World War I, he was affiliated until 1925. He published several novels, including *A Hind Let Loose* (1910), *Rough Justice* (1926), and *Right Off the*

Map (1928); *Dramatic Values* (1911) and *Disenchantment* (1922), essays; and *Fiery Particles* (1923) and *Action* (1928), volumes of short stories.

His brother, FRANCIS CHARLES MONTAGUE (b. London, Aug. 31, 1858; d. Oxford, April 8, 1935), was a historian. He served as curator of the Indian Institute, Oxford, from 1900 to 1913. His published works include *The Limits of Individual Liberty* (1885); *Life of Sir Robert Peel* (1888); *Elements of English Constitutional History* (1894); and contributions to the *Cambridge Modern History* and Longman's *Political History of England* (1907).

MONTAIGNE, môn-tên'y', Michel Eyquem de, French essayist: b. Château de Montaigne, near Bordeaux, Feb. 28, 1533; d. there, Sept. 13, 1592. As a small child he was placed under the care of a German tutor who spoke only Latin to him, and at the age of six he was sent to the Collège de Guyenne in Bordeaux. He remained in Bordeaux for seven years, and probably studied philosophy there under George Buchanan (q.v.) and Marc Antoine Muret. Thereafter he probably studied law at Bordeaux and Toulouse, and when he came of age was made a counselor of the Cour des Aides of Périgueux. This court was abolished three years later, and in 1557 Montaigne with the other members was appointed counselor of the Bordeaux Parliament, a body in which, about 1559, he made the acquaintance of Étienne de La Boétie, whose intimate friend he became. From 1561 to 1563, Montaigne was at the court of Charles IX, and he was present at the siege of Rouen in 1562. In 1565 he married Françoise de La Chassaigne, daughter of one of his fellow counselors. The deaths of his father and La Boétie in 1568 greatly lessened Montaigne's interest in public affairs. After preparing his friend's posthumous works for publication and publishing (1569) his own translation of Raymond of Sabunde's *Theologia naturalis sive Liber creaturarum*, for which he received the Order of St. Michael, he sold his post as counselor and retired to Montaigne in 1570. There in the following year he began, and in nine years completed, the first two books of his *Essais*. It is not known whether or not he intended them for publication, although their style seems to point to the fact that in their earliest form they must have been merely jottings in a commonplace book. Except for an occasional trip to Paris, Montaigne did not leave the château until 1580, when, his health having greatly deteriorated, he set out on travels through Switzerland, Germany, and Italy, meeting Torquato Tasso at Ferrara. (His *Journal* of this trip was discovered and published in 1774.) During his absence from France, and apparently against his will, he was elected mayor of Bordeaux. He served in this office from 1581 to 1583, and then was re-elected for another two-year term. His administration, which was highly successful, came to a close in 1585, and he spent the next three years in revising the first two books of the *Essais* and adding a third. In 1588 he accompanied Henry III to Rouen. His last years were spent in revising his work.

Montaigne had five daughters; only one of them, Léonor, of whom he was very fond, survived him. He was also much attached to Mlle. Marie Le Jars de Gournay, whom he called his adopted daughter, and who was fortunate enough to receive from Montaigne's widow a copy of his *Essais*, with

manuscript additions and corrections, the basis of a new edition, published in 1595. Montaigne's literary reputation is safe, though in the hands of the few, not the many. His spirit is skeptical, essentially typical of his time, and it was not for nothing that his study at Château Montaigne was decorated with texts from Ecclesiastes, Ecclesiasticus, Lucretius and Horace, for he was akin to these ancient writers who proclaim the vanity of all things. His theme is varied, his treatment discursive and his charm largely due to this very variety, together with a quaintness and raciness of style that did much for French prose and was mostly original even if patterned on Amyot. His manner of approaching the questions of life and criticism is apparently purely subjective; indeed, his delightful egoism that makes his own life, experiences and thoughts the theme of the essays seems at first to be quite independent of so serious a purpose. But this subjective manner brings him nearly as close to the analysis of universal problems as does the dramatic objectivity of a Shakespeare. His entire attitude is skeptical, but he is not to be ranked as the enemy of religion. He is the curious, interested skeptic, not the doubting cynic. Professor Saintsbury well says that the nearest spiritual parallel to Montaigne in literature is Charles Lamb.

Montaigne affected English literature scarcely less than he did French. His essays, translated by Florio (1603), seem to have been known to Shakespeare in their English form, and this same version, revised by Hazlitt (1893), is still the standard in English. The best editions of the original are those by Amaury-Duval (1820) and Le Clerc (1865). (See MONTAIGNE'S ESSAYS, FLORIO'S TRANSLATION OF) Consult the appreciations by Emerson, 'Representative Men' (1850); Church, 'Miscellaneous Essays' (1888); Pattison, 'Essays' (1889), and Pater, 'Gaston de Latour' (1896); also Bonnefon, 'Montaigne et ses Amis' (1892); Stapfer, 'Montaigne' (1894); Lowndes, 'Michel de Montaigne' (1898); Guizot, 'Montaigne' (1899); Champion, 'Introduction aux Essais de Montaigne' (1900); Dowden, E., 'Michel de Montaigne' (Philadelphia 1905); Woodberry, G. E., 'Great Writers' (Garden City 1907); 'Montaigne's Essays,' trs. by G. B. Ives (Harvard Univ. Press 1925).

MONTAIGNE'S ESSAYS, Florio's Translation of. The interest of Florio's translation of the essays of Montaigne is manifestly due in the first place to Montaigne and only very secondarily to Florio. The world has never failed to find the good-natured and wise father of the modern essay both amusing and interesting, and Montaigne, in whatever dress he might wear, would be sure of a welcome in any reflecting but not too serious society of men and women. Yet it is no small credit to Florio that he has not only kept Montaigne alive and to the fore in his translation, but has also managed to slip in by the way some considerable flavor of himself. His translation of his French original is not always accurate in detail, though it is perhaps not less accurate than translations customarily were in the days when it was made. It has something better, however, than simple verbal accuracy, it has color and life. Like most Elizabethan trans-

lators, the English word stands as the equivalent of a significant word of his original. In be sure to get the full content of his source, he amplified by the addition of intensifying modifiers and synonyms. The result is that the translation is often more wordy and more highly colored stylistically than the original, is often quaint and colloquially picturesque when Montaigne is simple and direct. Florio was above all a lover of the ingenious style and his ingenuity not infrequently betrayed him into the grotesque. He was fond not only of strange words, but also of puns, alliteration and the other frippery of the courtly writing of his day. When it suited his convenience he did not hesitate to Anglicize a French word, with the result that though he put Montaigne "in English clothes" it was done "many times with a jerke of the French jargon." Yet when one compares the 'Epistle Dedicatorie' of the translation, addressed to his "best-best Benefactors and most-most honored Ladies, Lucie Countesse of Bedford; and her best-most loved-loving Mother, Ladie Anne Harrington," where he was writing in his own person, with the body of the translation, one notes with gratitude that Florio has not done his worst in the way of verbal ingenuity. His original exerted a salutary restraining influence when he came to the actual task of translating, and few readers will cavil at him for being occasionally Florio, since he really gives us Montaigne.

GEORGE PHILIP KRAPP.

MONTALEMBERT, Charles Forbes de Tryon, shärl förb də trē-ōn mōn-tā-lōn-bär, COMTE DE, French publicist and historian: b. London, England, 29 May 1810; d. Paris, 13 March 1870. He received a university education at Paris; identified himself with the Liberal Catholic movement of Lamennais (q.v.) and Lacordaire (q.v.), whom he assisted in establishing (18 Oct. 1830) and editing *L'Avenir*, and in efforts to obtain the freedom of education at that time impossible under the state system, and in 1831 went with these two leaders to Rome to present their cause. On his return he opened with Lacordaire and De Caux at Paris a free Catholic school, which was promptly closed by the police, while the directors were arraigned for infringement of the laws respecting instruction. Montalembert made a notable defense before the Chamber of Peers, but the directors were sentenced to pay the costs and 100 francs apiece in fines. When the doctrines of *L'Avenir* were condemned by Gregory XVI in an encyclical of 15 Aug. 1832, Montalembert duly submitted and did not proceed with Lamennais to final revolt. He entered the Chamber of Peers in 1835, spoke much and eloquently on ecclesiastical matters, and in 1836 published his 'Histoire de Sainte Elizabeth de Hongrie,' which appeared in an English rendering by Hackett and Sadlier (1854). His Catholic zeal was combined with liberal ideas and after the Revolution of 1848 he was elected as a Moderate Republican to the Constituent Assembly; but here, as in the Legislative Assembly, where he sat from 1849 to 1857, he became more and more conservative. In June 1851 he debated against Victor Hugo in opposition to the proposed constitutional re-

Kodachrome by Ray Atkeson.

● County Seat

vision. He found himself unable to support the measures of the Empire and was known as one of the most determined opponents of Napoleon III. His chief work, *Les Moines d'Occident depuis Saint Benoît jusqu'à Saint Bernard* (1860-1877) was translated into English as *The Monks of the West from St. Benedict to St. Bernard* in 1895. He wrote many pamphlets, the last of which, *La Victoire du Nord aux États-Unis* (1865), translated into English in 1866, was an appreciation of the triumph of the Union cause in the Civil War.

Consult Oliphant, M. O., *Memoirs of Count de Montalembert* (London 1872); De Meaux, *Montalembert* (Paris 1897); and Lecanuet, L. R. P., *Montalembert, d'après ses papiers et sa correspondance*, 3 vols. (Paris 1895-1902).

MONTEALEMBERT, môn-tà-lân-bâr', MARQUIS DE (MARC RENÉ), French military engineer: b. Angoulême, July 16, 1714; d. Paris, March 29, 1800. After serving with the French Army in many parts of Europe, he directed the construction of several forts in France. Seeing the defects of bastionary defense and opposing the Marquis de Vauban's trace system, in his principle work, *La Fortification Perpendiculaire* (1776-1786), he set forth his ideas favoring a massed fire power achieved by a system of detached forts built around a central military stronghold. His ideas were not well received in France, but abroad, especially in Germany, they were widely adopted. He was elected to the Academy of Sciences in 1747. At the time of the Revolution he emigrated but later returned and was made a general of division by Carnot in 1792.

MONTALVAN, môn-täl-vän', Juan Pérez de, Spanish dramatist and novelist: b. Madrid, 1602; d. there, June 25, 1638. He was already a success as a dramatist at 17 years of age and was soon working with Lope de Vega. In 1625 he was ordained by the church and became apostolic notary of the Inquisition. A collection of some of his works entitled *Comedias* appeared in two volumes in 1635 and was distinguished by a fervent national attitude. Several of his novels appeared in *Sucesos y Prodigios de Amor* (1624) and others in *Para Todos* (1632). His *Orfeo* (1624) is a poem in octaves. On the death of Lope de Vega he wrote *Fama Póstuma de Lope de Vega* (1636).

MONTALVO, García Ordóñez de. See GÓÑEZ DE MONTALVO, GARCÍA.

MONTANA, mŏn-tă'nă, most northerly of the Rocky Mountain states. It is bounded on the east by North Dakota and South Dakota, on the south by Wyoming, on the southwest and west by Idaho, and on the north by the Canadian provinces of British Columbia, Alberta, and Saskatch-

Land area	145,878 square miles
Water area	1,260 square miles
Total area	147,138 square miles
Latitude	44° 26'—49° N.
Longitude	104° 02'—116° 02' W.
Altitude (average)	3,400 feet
Population (1950)	591,024
Capital city—Helena; Pop. (1950)	17,581
Admitted as a state	Nov. 8, 1889
Bird	Meadowlark
Flower	Bitterroot (<i>Lewisia rediviva</i>)
Motto	Oro y Plata (Gold and Silver)
Nicknames	Bonanza State; Treasure State
Song	Montana
Tree	Yellow Pine

State seal.

ewan. The word *montana* is a Latin noun meaning "mountainous region."

Physical Characteristics. — *Topography.* — About half the state has an altitude under 5,000 feet, of which 40,700 square miles are less than 3,000 feet above sea level. Approximately 7 per cent of the area, or 10,000 square miles, shows an elevation of more than 8,000 feet.

About two fifths of the state, lying in the west and southwest, is mountainous. The main ridge of the Rockies extends from Glacier National Park in northern Montana to Yellowstone National Park on the southern border. About two thirds of the distance from the Canadian boundary, the Continental Divide turns abruptly west to the Idaho line, where it again takes a sharp angle to the southeast. From this angle juts the Bitterroot Range which, farther north, becomes the Cabinet Range. Between these ranges and the Rockies are small ranges, the most beautiful of which are the Mission and the Swan. East of the Rockies are many small ranges, some isolated and others jutting out from the main ridge. Parallel to the main ridge are the Big Belt and Little Belt Mountains, near the center of the state, and south of them the Crazy Mountains. Farther south are the Tobacco Root Mountains, Bridger Mountains, Ruby Mountains, and the Gallatin and Madison ranges. Extending east along the southern boundary are the lofty Absarokas and the Beartooth Mountains, highest in the state. Still further east are the Pryor and Rosebud ranges. Isolated ranges near the center of the state are the Bear Paw Mountains, Highwood Mountains, the Big Snowy, the Little Snowy, Moccasin Range, Blue Mountains, Elk Range, and other groups. Granite Peak, in the Beartooth Range, rises to a height of 12,850 feet, the highest point in the state.

Mountain passes are not high. Of those crossed by railways, the Pipestone and Homestake east of Butte are about 6,500 feet. Mullan Pass west of Helena is 5,547, and Marias Pass, crossed by the Great Northern Railway, is 5,125 feet. Main highways traverse the same passes or others of about equal height.

State flag.

East of the mountains lie the Great Plains broken by much rolling country and isolated mountains.

Rivers.—In the mountains of Montana rise streams that feed many of the great rivers of the western half of the continent. From the Glacier Park region, they flow north to the Saskatchewan, east to the Missouri and west to the Columbia. The Missouri finds its source in the Jefferson, Madison, and Gallatin ranges, fed by melting snows that also supply the sources of the Clark Fork, which flows west. The Yellowstone, whose sources interlock with those of the upper Missouri, also joins the waters that empty into the Mississippi. Clark Fork, which flows into the Columbia, finds its source in the springs and melting snow that form Silver Bow Creek. The Blackfoot rises high on the Continental Divide near Lewis and Clark Pass, 6,350 feet above sea level and flows into Clark Fork a few miles east of the Bitterroot Mountains. The Bitterroot River drains a large area between the Bitterroot Range and the Continental Divide into Clark Fork. An important affluent is Flathead River, which flows into Flathead Lake from the north and out of it at the lake's south end to join Clark Fork near Paradise.

Lakes.—In Glacier Park are some 250 lakes. In hollow places in the mountains outside, nestle many others, some hardly more than ponds, fed by mountain snow and reflecting varied hues spun by sunlight and clouds on the many colored rocks of the region. Flathead Lake, with an area of some 200 square miles, is the largest natural body of water in the state.

Climate.—The climate is varied. Greatest extremes are in the northeast where a low of -65° and a high of 117° have been recorded. The Yellowstone Valley has a more equitable and mild climate. West of the mountains, which break the high winds of the plains, temperatures vary less. Mean temperatures recorded vary from approximately 46° in the Yellowstone to 35° in some high altitudes. Rainfall east of the mountains is generally below 15 inches annually. West of the divide, it amounts to something more. The mean for the state is about 18 inches. Rains generally occur in the autumn and spring, and the late summer months are usually dry. Growing seasons are relatively short, but the long days of northern latitudes compensate to some extent. There is much sunshine east of the mountains. West of the divide the days are often cloudy. The climate is regarded as salubrious and generally agreeable.

Irrigation.—The semiarid climate calls for irrigation, and the abundance of water accumulated by mountain snows during the winter makes feasible the irrigation of large parts of the state. The first undertakings of this sort were made by individuals. For larger areas, cooperative organizations and corporations were formed and some continue to the present. The Carey Act of 1894 provided capital through grants of federal lands. Large projects, such as those irrigating 19,000 acres on the Billings Bench, 16,000 acres near Brady, 60,000 acres near Valier, and 5,000 acres near Bigtimber were planned, but much of the work was never completed.

The National Reclamation Act of 1902 provided for a more rapid expansion of irrigation. Extensive projects were undertaken by the Bureau of Reclamation which, by 1949, had made water available to more than 235,000 acres. Some of these projects are very large. In northern Mon-

tana, Sun River irrigates more than 75,000 acres, and Milk River more than 66,000 acres. On the Yellowstone, the Huntley project irrigates 24,000 acres and the Lower Yellowstone 48,445, part of which is in North Dakota. Buffalo Rapids, near Glendive, provides water for more than 20,000 acres. In southwestern Montana are a number of small projects.

The Bureau of Indian Affairs has promoted irrigation on Indian lands. The reservations have been breaking up and whites as well as Indians profit from these projects. On the old Flathead Indian Reservation, peopled largely by whites, nearly 75,000 acres were irrigated in 1949 and 30,000 additional acres were to be brought under the ditch. On the Blackfeet Reservation, 12,363 acres were irrigated, on the Crow Reservation, 21,579 acres were supplied with water, on Ft. Belknap, 12,679 acres, and on the Rocky Boy 628 acres (see also *The People—Indians*).

In the 1940's, private enterprise, supplied with federal funds returned to extensive irrigation projects. Artesian wells and water storage in reservoirs were developed for spot irrigation. In 1940, lands under irrigation were reported as 2,340,390 acres and further expansion was planned, particularly from Fort Peck. In 1949, bids were advertised for construction of the Canyon Ferry Dam on the Missouri, near Helena, to irrigate 245,000 acres.

Political Divisions.—*Cities and Towns.*—Most of the cities and larger towns of Montana showed increases in population between the 1940 and 1950 censuses. An exception was Butte, formerly the state's largest city, which declined in population from 37,081 in 1940 to 33,251 in 1950. Great Falls, which by 1950 became Montana's most populous city, grew from 29,928 in 1940 to 39,214 in 1950; Billings from 23,261 to 31,834; Missoula from 18,449 to 22,485; Helena from 15,056 to 17,581; Anaconda from 11,004 to 11,254, and Bozeman from 8,665 to 11,325. Four other cities, Havre, Kalispell, Livingston, and Miles City, have populations above 7,500. For populations of other communities in Montana, see reverse side of state map.

Butte, high on the west slope of the Rockies, was built upon the copper industry and was once reputed the "richest hill on earth." Copper mines are sunk to great depths and so extensive became the diggings that, during periods of low-priced copper many proved unprofitable. With higher prices, mines were reopened in 1947 but did not immediately return to full production because of the scarcity of labor. The Anaconda Copper Mining Company, one of America's great corporations, had its first mines in Butte and now owns most of them. It is reworking the tailings discarded in years gone by and reports profitable returns. Butte has the best railroad facilities of any city in Montana. Two transcontinental lines traverse the city and it has direct lines to Anaconda; Ogden, Utah; and to Helena, and Great Falls. Bus and truck lines spread in all directions. Advantages of transportation facilities give Butte a pre-eminent position for general wholesale and retail trade, as well as for shipments of metals and ore. The city is the home of the Montana State School of Mines and numerous attractive Catholic churches. Great Falls, the power city, takes its name from the Great Falls of the Missouri, near which it is located. The advantages of this site were first proclaimed by the pioneer, Paris Gibson (1830-1920) largely

rough whose efforts the Great Northern Railway was extended to the new metropolis. Here, vast quantities of hydroelectric power are generated to be used by factories and a huge smelter, well as by railways, and to light a vast farming region. Billings, on the Yellowstone, is the center of a vast wheat and beet growing and stock raising area. The city has a large beet sugar factory and many small industries. It has good transportation facilities for transcontinental shipments east and west, as well as trade with St. Louis. Here is located the Eastern Montana Normal College and Rocky Mountain College. Missoula, located in the extreme western part of the state, is the center of extensive agricultural, live stock and dairying industry and of a great forest area. Transportation is handled adequately by two transcontinental railways and feeder lines. Missoula is the home of Montana State University, and headquarters for District Number 1 of the United States Forest Service. Helena, the capital, is a distributing center for a large stock raising area. Carroll College, a Catholic institution, is located in the city. A large smelter is operated in nearby East Helena. Anaconda, the smelter city, is on Warm Springs Creek. The smoke stack of its smelter, 585 feet high, is a landmark for many miles. The smelter is primarily for copper ore but, connected with it are plants for the manufacture of arsenic, sulphuric acid, and superphosphate fertilizers. Bozeman, in the Gallatin Valley, is the center of a rich farming area and the location for milling and sawing plants. Montana State College is located here. Kalispell, west of Glacier Park and near Hungry Horse Dam, is a shipping point for northwestern Montana.

Counties.—There are 56 counties in the state. Some of them have a population of less than 1,000 and are supported chiefly by taxes on railroads and other public utilities, oil fields, or coal mines, within their borders.

County	County Seat	County	County Seat

The People.—The census of 1940 reported 540,464 white people within the state, 16,841 Indians, 1,120 Negroes, and 1,031 Asiatics. The population increased from a total of 559,456 in 1940 to 591,024 in 1950, an increase of 31,568, or 5.6 per cent. The state ranks 42d in population among the states. In Butte, the majority of people are of Irish descent and Finns are sec-

ond. Along the northern border are many of Norwegian blood and in the extreme west are many of French ancestry.

Due to the prosperity of farmers, farm population has apparently increased, but villages and small towns classed as rural decreased sufficiently to show a net decrease in rural population. Urban population, which was 211,535, or 38 per cent, in 1940, increased to 258,034 in 1950, when it comprised 43.7 per cent of the total population. In March 1952 the state Unemployment Compensation Commission reported 143,200 employed in nonagricultural work and 5,900 unemployed. Church membership in 1945 was reported as 160,138, of which 75,292 were Roman Catholics.

Indians.—Indian population increased notably after 1940, but the vast majority remained under the jurisdiction of the Office of Indian Affairs. Under the Indian Reorganization Act of 1934 and subsequent acts, most of these Indians are grouped around agencies and have adopted new forms of tribal government. Constitutions were approved in 1935 for the Blackfeet, Flathead, Fort Belknap, Rocky Boy, and Tongue River agencies. Only the Blackfeet and Crow Indians preserved their tribal integrity. The Flathead Agency (3,630 Indians in 1945) deals with the confederated tribes of Salish, Kootenai, and Upper Pend d'Oreille; the Fort Peck Agency (3,116) includes Assiniboine and Sioux; the Rocky Boy Agency (878) consists mostly of Chippewa and Cree; and the Tongue River Agency (1,719) deals mostly with Cheyenne. There also were 5,164 Indians on the Blackfeet Reservation in 1945, 2,488 on the Crow Reservation, and 1,805 Assiniboine and Gros Ventre at Fort Belknap.

Natural Resources.—**Fauna.**—The Great Plains area, once part of the great bison (buffalo) range of the Northwest, has become a region of stock ranches. The bison were almost completely destroyed by the whites, in which they were encouraged by the army in order to make the Indians dependent upon the Indian agencies for subsistence and thus keep them on the reservations. A herd of bison is maintained on the Montana National Bison Range, where there were some 440 in 1940, and at Yellowstone National Park, where there were about 900 in 1947. These parks also shelter deer and antelope.

Mule deer and the black-tailed variety are fairly plentiful in Montana, but such animals as mountain sheep, antelope, moose and elk are becoming rare, being encountered only infrequently in the less settled areas, as are puma, lynx, wolves, and grizzly and black bears. Various birds, such as grouse, geese and ducks are more plentiful. Montana's main varieties of fish are salmon, trout, whitefish and grayling.

Flora.—The grama grass and bunch grass, once characteristic of the plains and foothills, persisted until well into the 20th century. Then, a period of unusual rainfall accompanied by rising prices for grain, particularly during World War I, induced ranchers and new settlers to plow the ground for wheat. A few years of plenty were followed by a return of drought, and the wind eroded the soil, destroying plant life. Under the soil conservation plan of the Franklin D. Roosevelt administration, much of this land was purchased and efforts undertaken to restore it to former production. During the period of high prices for farm products beginning in 1946, much grass land was again ploughed to be seeded with wheat.

Water Power.—Mountain streams and great rivers afford an abundance of power. At the Great Falls of the Missouri immense hydroelectric power is developed, and many dams above them, extending beyond the Three Forks, provide much more. West of the divide are large power developments near Missoula, at Thompson Falls, and the largest at the outlet of Flathead Lake. All these are privately operated. Federal projects at Fort Peck and at Hungry Horse, are planned to provide many times the two and one half billion kilowatt-hours generated annually. Fort Peck was nearly completed in 1948, and Hungry Horse was scheduled for completion in 1954 at a cost of \$100,000,000. On the Missouri, near Helena, the Canyon Ferry Dam power facilities to be developed are estimated at 245,000,000 kilowatt-hours.

Parks, Reservations and Preserves.—Montana advertises extensively the features that attract tourists. The best known of these is the Glacier National Park, located along the Canadian border, straddling the crest of the Rockies. Its area of 1,534 square miles has been characterized as the wildest, shaggiest block of mountain fastness in the country. A small portion of Yellowstone National Park is in Montana, but the principal area lies in Wyoming. Other mountain areas present scenes of beauty and charm. Snow-capped peaks, rugged cliffs, waterfalls, and lakes afford visitors an ever-changing wonder. There are hundreds of hot springs within the state; at some 30 of the largest, hotels and bath houses are available.

The United States Forest Service has built roads and developed camp sites at attractive places within the 13 national forests lying wholly or partly within the state. In these forests, are five "primitive areas" embracing more than 1,000,000 acres of exceptional beauty. The state maintains seven forests containing 200,000 acres of which much is attractive natural scenery. Dude ranches are scattered throughout the isolated parts of the state and tourist camps are numerous along the principal highways.

Large areas in Montana were formerly designated as Indian reservations but these have been reduced or abolished until few remain. Whites have obtained large tracts, particularly on the old Flathead Reservation. The Blackfeet, Crow, Fort Belknap, and Rocky Boy Agencies have held the Indian lands most successfully as reservation units (see also *The People—Indians*).

Glacier National Park is both a bird sanctuary and game preserve. Large bird sanctuaries are located in Lewis and Clark County and on two islands in Flathead Lake. There are many small ones on private property. About 33,000,000 acres, or one third of the land in the state, is government-owned.

Production and Manufacture.—Agriculture.—Farming began in Montana before the discovery of gold, but growth was slow. The 1870 census reported 851 farms and 139,357 acres under cultivation, valued, with livestock and equipment, at \$2,154,569. Wheat was the principal crop. Early farms were irrigated, but the Desert Land Act of 1877 brought in dry-land settlers who by 1880 had established 370 desert farms.

In the decade of the 1880's homestead entries spread over the Yellowstone Valley and in north-west Montana. By 1920, there were 48,000 farms and 11,000,000 acres, of which 15 per cent was irrigated. In 1930, the number of farms still re-

mained at nearly 48,000 but acreage had grown to 44,659,152. In 1940, farm land had increased to 46,451,594 acres but the number of farms had fallen to 41,823. This trend continues.

The farm boom, beginning in 1910, collapsed with the droughts from 1917-1919, and the decade of the 1920's brought new problems which seemed almost solved when the depression of 1929 hit farmers a heavy blow. Farm income for 1930 was \$95,000,000, but was much lower during most of the intervening years until 1940 when it rose to \$96,472,000. It climbed to \$140,153,000 in 1941 to \$226,156,000 in 1944, and to \$400,000,000 in 1948. Wheat production increased from 30,000,000 bushels in 1930 to an estimated 90,500,000 bushels in 1948. Wheat, barley, oats, and rye have long been cultivated. Alfalfa is grown extensively. Flax seed, sugar beets, mustard seed and seed peas and vegetables for canning have increased in recent years. Fruits, particularly apples, cherries, strawberries, and raspberries have become important since 1910.

Stock raising became a great industry during the decade of the 1880's and has shown many variations. Between 1870 and 1890 cattle increased from about 50,000 to 1,000,000 and sheep from 2,000 to 2,000,000. By 1900, the ranges were crowded. Cattle pasturage was damaged by sheep, which increased to 6,000,000. The ranges were broken up during the next 20 years by homesteaders. Many farmers turned to milk production. In 1930, there were 1,226,000 cattle "on farms" and about 4,000,000 sheep. By 1949, cattle had increased to 2,000,000 and sheep decreased to 2,000,000. In the same year there were 200,000 hogs and 170,000 horses and mules. Wool production declined from 34,000,000 pounds in 1930 to 24,000,000 pounds in 1947, but higher prices increased value from \$7,000,000 to about \$12,000,000.

Lumber.—Montana contains about 52 billion board feet of standing timber, of which about 10 billion feet is Douglas fir, with slightly less Ponderosa pine and western larch. Lodgepole pine and Engelmann spruce together comprise nearly 11 billion feet. Timber production increased from 293,000,000 board feet in 1930 to 448,000,000 in 1944. Due to the unprecedented demand for lumber, production expanded in 1944 to more than 600,000,000 board feet. Other products of lumbering are 75,000 cords of fuel wood annually, 3,000,000 cubic feet of mine timbers, 3,000,000 cubic feet of fence posts, and 2,000,000 cubic feet of pulp wood. More than 3,000,000 Christmas trees are cut annually. Depletion of forests is partially offset by efforts of the United States Forest Service to protect immature timber when the mature trees are cut, to prevent forest fires, and by vigorous tree planting. A nursery at Haugan, near the west end of the state, produces 4,000,000 trees annually, about one third of which are planted in Montana on cut-over or burned-over areas. National forest areas furnish grazing for some 200,000 horses and cattle and for half a million sheep, all at a nominal charge.

Minerals.—Montana has long been known as a mining state. The first mines were metal but since 1900, coal, petroleum, and natural gas have been produced in great quantities. Upward trend of metal prices in the 1940's increased the value of metal production. The total value of minerals produced since mining began in 1863 through 1947 amounted to about \$4,000,000,000. Variations were great from year to year but, after 1926, production generally declined and mining was

second to agriculture. An outstanding feature of metal mining in the first half of the 20th century was concentration of operations in one organization, the Anaconda Copper Mining Company. In 1947, it mined 94 per cent of the copper, 73 per cent of the silver, 72 per cent of the zinc and 47 per cent of the lead. Production of metal mines in 1948 was valued at approximately \$50,000,000 and of coal, petroleum, and gas at about \$40,000,000.

Gold was the first mineral mined in Montana. Small quantities were found before the Stuart discoveries on Gold Creek in the early 1860's started a gold rush to the territory. More important mines were soon found along Grasshopper Creek, in Alder Gulch, Last Chance Gulch, and in other places. The first mines were placer, but quartz mining began with the discovery of the Decatur Lode near Bannack and was extended to Philipsburg, Butte, and many other locations. Small stamp mills were built near all these mines and crushed large quantities of ore to be washed for gold long after the placer mines were exhausted. Gold production continued in connection with silver mining and as a by-product of copper and lead ores. After World War I, the gravel of the great gold-producing gulches, where placer mines had once washed out fortunes, was worked again by steam shovels with profit to the operators. Devaluation of the dollar during the depression, which raised the price of gold to \$35.00 an ounce, roused many retired placer miners to new efforts and stimulated mining companies to look more carefully for gold-bearing ore. Gold mined in 1930 amounted to 43,489 ounces valued at \$899,001 and in 1940 to 272,602 ounces valued at \$9,541,070. During the war, gold production declined to 44,597 ounces in 1945, but rose to 86,400 ounces in 1947, but fell to 73,880 ounces in 1948.

Silver production began in the 1860's as a by-product of gold-bearing quartz. In 1875, William A. Clark built the Dexter Stamp Mill at Butte and silver mining expanded. Production increased extensively during the next two decades and declined only after the defeat of William Jennings Bryan in 1896 apparently ended the use of silver as money and stabilized its price at less than 50 cents an ounce. Silver remained of minor importance for many years. In 1930, production was 7,052,889 ounces, valued at \$2,715,362. Inflationary trends of the 1930's and legislation supported by the "silver bloc" increased the price of silver, and its production. In 1940, silver mined was 12,361,050 ounces, valued at \$8,790,080. World War II reduced silver production, and in 1946 it amounted to only 3,273,140 ounces valued at \$2,644,697. Further increase in the price of silver to \$0.905 per ounce voted by Congress increased production in 1948 to 6,776,000 ounces valued at \$6,437,200 and further expansion of silver production was anticipated.

Copper mining began about 1880 when Marcus Daly, a Butte silver miner, deepened his Anaconda mine to more than 100 feet. He found a vein of rich copper ore whose product he shipped to Swansea, Wales for smelting. Within the next few years were built the huge reduction works at Anaconda and copper became the most valuable product of Montana mines. From 1890 to 1948, it exceeded in value all other metals combined, and total production through 1947 amounted to approximately \$2,000,000,000. Copper production came to 352,139,768 pounds in 1916, but in 1930

it was 196,187,523 pounds. It fell to 63,000,000 in 1934 and rose to 252,782,000 pounds in 1940. During World War II it rose to 282,388,000 pounds but declined to 115,250,000 pounds in 1947. In 1948 copper production was valued at \$25,000,000.

Lead occurs in mixed ores. Greatest quantities have been obtained from Butte mines. Lead is mined also in Cascade, Lewis and Clark, Broadwater, Jefferson, and Madison counties. Lead production goes back to 1883 and, in 1918, rose to 19,000 tons. It continued thereafter at a high rate of production until 1930 when it sank to 10,653 tons. In 1940, 23,000 tons were mined and production remained high during World War II. In 1946, production was only 8,000 tons, but in 1947 it jumped to 15,500 tons and the value of the output amounted to \$4,526,000.

Zinc became important in 1910 when 16,000 tons were produced. Smelting was difficult until scientists of the Anaconda Company devised improved processes. In 1915, output was 94,000 tons and in 1916, 115,000 tons. After World War I, there was a decline to an annual rate of about 70,000 tons. In 1930, production was 26,421 tons, but by 1940 it rose to 52,287 tons. In 1946, it fell to 16,770 tons with a value of \$4,091,880, but in 1947, it rose to nearly 50,000 tons valued at \$14,440,000. This increase in lead and zinc in 1947 came almost entirely from the Butte mines.

Smelting of these metals is done at great reduction works at Anaconda, Great Falls, and East Helena. The Anaconda Company's copper smelter at Anaconda has a yearly capacity of 1,300,000 tons and its zinc smelters at Anaconda and Great Falls have a combined capacity of 233,400 tons of slab zinc. In 1947, zinc plants containing 448,367,000 pounds of zinc concentrates were received from all western mining states and some foreign companies. The company operates a zinc fuming plant at East Helena and in 1947 the output of zinc-lead fumes was 40,000 tons. The American Smelting and Refining Company's refinery at East Helena treats chiefly lead-silver concentrates from Idaho and Washington, residues from Anaconda plants, and old tailings from various districts in Montana. In 1947 and 1948 a number of small mills were constructed in the state.

Manganese was produced in large quantities during World War I and, in 1918, amounted to 200,000 short tons. In 1930, production was reported at 53,138 tons, and fell to 25,715 in 1940. In 1946, the output was 142,000 tons but in 1947 fell to 133,360 short tons.

Sapphires and garnets are found in considerable quantities. Production is not concentrated and the value of the output is undetermined. Phosphate production in 1948 amounted to \$6,000,000. Fifty of Montana's 56 counties produce coal. Lignite deposits in the eastern section have been estimated at 380 billion tons, with a further reserve of 25 billion tons of bituminous farther west. In the 1940's annual production averaged about 4,000,000 tons. The principal fields are at Sand Coulee, southeast of Great Falls; at Red Lodge and Roundup, near the south central section; and at Colstrip in the east. At Colstrip, the surface soil is first removed by huge strippers and the coal mined by large shovels.

Montana has fields of petroleum and natural gas located east of the mountains. Production began between 1913 and 1915, and in general showed a steady increase through 1947. In 1948, the output of oil was 9,376,634 barrels. Gas produced was 32 billion cubic feet with a value of

\$8,640,000. Oil refineries at Great Falls, Lewistown, Butte, Laurel, Sunburst, Cut Bank and other places serve the great oil companies and a number of small concerns.

Montana produces phosphates, gypsum, vermiculite, graphite, asbestos, bentonite, calcite, mica, corundum, and other minerals.

The Montana State Bureau of Mines and Geology with headquarters at Butte, carries on projects for mapping all the mineral resources of the state. The United States Bureau of Mines makes studies of production and trends as well as other researches.

Manufactures.—Manufactures are devoted largely to processing minerals, timber, and agricultural products. Power is mostly hydroelectric. Lumber mills, beet sugar factories, plants for canning fruits and vegetables and for manufacturing dairy products are widely scattered. Meat packing is important. The lumber department of the Anaconda Copper Mining Company operates huge mills at Bonner, near Missoula. Plans are announced for pulp manufacture, for wool cleaning plants, and the production of pig iron.

Transportation and Communication.—The Great Northern, the Northern Pacific, and the Chicago, Milwaukee, St. Paul and Pacific railroads parallel each other across the state. The Burlington has a branch line between St. Louis and Billings, and the Union Pacific connects Ogden, Utah; and Butte. Branch lines of the Northern Pacific and Great Northern extend to many communities off the main lines. The state has 5,000 miles of railway. Federal and state highways extend 8,809 miles, of which about 7,000 are surfaced. Transcontinental airlines cross the state from east to west, and Great Falls and Butte are served by an airline extending to southern California. In 1948, there were 79 regular airports and 21 other landing fields. Telegraph lines parallel all the railroads, and in 1947 the state had 111,000 telephones in use.

Economic and Financial Factors.—On Dec. 31, 1948, there were 39 national banks with total deposits of \$291,300,000, and total loans of \$56,586,000, and 73 state commercial banks with total deposits of \$286,182,000 and total loans of \$79,754,000. Total assets of national banks were \$304,970,000; of state commercial banks, \$298,703,000.

The state auditor reported the net worth of the state on January 1, 1949 as \$86,716,958. There was a net balance in state funds of \$51,592,839, and bonded debt was \$11,533,500. State income in 1948 amounted to \$22,000,000, of which \$19,000,000 was supplied from taxes. The assessed valuation of the property in the state was \$1,340,000,000 and the tax value \$400,000,000. Personal income amounted to \$827,000,000; property taxes for state, county, municipal and school taxes took \$40,000,000 in taxes, counties received \$11,000,000, cities and towns \$7,000,000, schools \$19,000,000, and the state took the balance. Other sources of state income were from gasoline and oil, \$10,500,000; liquor taxes and profits of the state monopoly on liquor, \$5,100,000; income taxes, \$3,158,000; and business and license taxes \$5,000,000.

Government.—The executive department consists of a governor, lieutenant governor, secretary of state, attorney general, state treasurer, state auditor, and superintendent of public instruction. All are elected for terms of four years. Each is independent in performing the executive duties

except that some are subject to boards. Such boards exercise extensive powers. The State Board of Examiners, consisting of the governor, secretary of state, and attorney general is the most powerful. It prepares the budget and controls all expenditures. A governor's commission in 1943 recommended consolidation of executive duties, but the plan was poorly prepared and failed to pass.

The governor is general party leader and his position is strengthened by large appointive power and by item veto of legislation. He represents the state in all important matters.

The legislature is bicameral and meets regularly in odd years. There are 56 senators, one elected from each county for a term of four years. The House of Representatives has 90 members, elected for two year terms. Each county has at least one representative. Under this system the rural counties which are more numerous than the urban counties, but whose population is much smaller, control both houses of the legislature.

Although the legislature is generally Republican, there were only three Republican governors in the history of the state (1889-1948).

GOVERNORS OF MONTANA

TERRITORIAL

Sidney Edgerton	Republican	1864-1869
Thomas F. Meagher, Acting	Democrat	1865-1869
Green Clay Smith	"	1869-1870

W. Elmer Holt	"	1915-1917
Roy E. Ayers	"	1917-1921
Samuel C. Ford	Republican	1921-1924
John W. Bonner	Democrat	1924-1925
J. Hugo Aronson	Republican	1925-1926

The Judicial Department consists of the Senate as a court of impeachment, a supreme court, 18 district courts, and justices of the peace. District courts exercise original jurisdiction in all civil cases when the value of the property in controversy exceeds \$50.00, and in cases of felony and misdemeanor, and of torts, divorce and of special actions.

There is a state board of health and most counties have health officers. Larger cities also have health officers frequently by contract with the county for a joint health service.

The Department of Public Welfare, established in 1937 has charge of old age assistance, care of mothers with dependent children and help for the blind. In 1947, this department spent about \$8,000,000. The state maintains homes for orphans, and schools for the blind, and deaf and dumb, an old soldiers' home, a tuberculosis sanitarium, an insane asylum, and a school for feeble-minded. The penitentiary at Deer Lodge houses adult criminals, and there are special reformatories for juveniles.

The legislature has set up a workmen's compensation law, and the state cooperates with

Weird geologic formations are characteristic of the Bad Lands in the eastern section of the state.

he federal government on other social security policies.

Initiative and referendum was established in 1906 and woman suffrage in 1914. The secret ballot is required and there is a severe "corrupt practices act" governing elections.

Local government is based on counties which are creatures of the state. Townships are rudimentary. The law provides for consolidation of city and county governments under a commission-manager plan, but this had not been put into operation as of 1948. County administration is decentralized. The main executive powers are vested in a board of county commissioners who generally exercise only mandatory powers. Most county officers are elected for 4 year terms. The state examiner checks county finances and the state highway commission controls important roads.

Educational System.—The state educational system is under control of the State Board of Education, of which the governor is chairman and the state superintendent is secretary. The University of Montana consists of a State University at Missoula, a State College at Bozeman, a State School of Mines at Butte, a Northern Montana College at Havre, a Western Montana College of Education at Dillon, and an Eastern Montana College of Education at Billings. The executive head is a chancellor whose office is at Helena. Each of the units has a president. Total registration in January 1949 was about 7,500 of whom a majority were former service men. Of these about 3,300 are at the State University which provides liberal arts and science courses and maintains schools of law, forestry, business administration, journalism, pharmacy, and music. It also has curricula in social work, wild life, and Pre-medical. The State College with about the same registration, is a land-grant college and specializes in agriculture and engineering, but offers courses in sciences and humanities, nursing art, and secretarial work. The Northern Montana College is largely a junior college. The work of the other institutions is designated by their names. Elementary schools and high schools in Montana are administered separately from county and city government. In 1948, there were about 1,500 school districts of which 200 operated no schools. Grade teachers numbered 3,406 and high school teachers 1,338. Elementary schools had 69,278 pupils enrolled and high schools 25,150. Cost of operation amounted to \$19,000,000. The State Board of Education directs educational policies, and the superintendent of public instruction is administrative head of the school system within his county. There is a fairly adequate retirement system for teachers, strong tenure contracts for university teachers, but for other public school teachers the law requires only a notice for dismissal and a hearing.

Libraries.—Most of the public and college libraries in larger communities have special collections of books and documents on the history of Montana and the Northwest. One of the best of these is at the Montana State University Library in Missoula. Other libraries which are notable for their special collections are the Montana State Law Library at Helena and the law library at the State University in Missoula, for their legal collections; the Montana School of Mines Library at Butte, for geology and metallurgy; the Parmly Billings Memorial Library at Billings, for petroleum; and the Montana State College Library at

Bozeman, for agricultural subjects. The library of the Historical Society of Montana is in Helena, and its exhibits are in the state capitol.

History.—The lands now included in Montana were the homes of savage Indians. In the east were the Plains Indians whose food, clothing, shelter, and fuel were derived from the bison. They moved with these animals, but the Blackfeet, an Algonquin tribe, claimed their homes along the upper Missouri, and the Crows made their habitations in the Yellowstone Valley. In northwest Montana were the Kootenays who feared to cross the mountains to hunt the prized bison because of Blackfoot enmity. The Pend d'Oreilles and Flatheads or Selish, however, often crossed the mountains to fight the Plains Indians for hunting privileges. Along the headwaters of the Jefferson lived the Bannacks, a Shoshonean tribe of low culture, afraid of the Plains Indians.

The arid and treeless Great Plains checked the efforts of early explorers and traders to cross them. The earliest known whites to visit Montana were led by the sons of the famous trader Pierre Gaultier de la Vérendrye (1685-1749). In 1642, they crossed the southeastern part of Montana.

The Louisiana Purchase of 1803 ceded the "upper Missouri" and Yellowstone country to the United States, and the Lewis and Clark expedition gave the republic claim to the Clark Fork country. American rights to this region were recognized by Great Britain in the Convention of 1818 and the Oregon Treaty of 1846, and by Spain in the Florida Treaty of 1819.

Until about the middle of the 19th century, the whole of later Montana was a land of Indians, and white trappers and fur traders. Manuel Lisa of the St. Louis Missouri Fur Company built a post at the mouth of the Big Horn and started Indian trade there in 1808. From this post, John Colter explored the Yellowstone Park area, but a new post at Three Forks was destroyed by Blackfeet in 1810.

In 1822, William H. Ashley and Andrew Henry of St. Louis began to trade on the upper Missouri and Yellowstone. Traders of this partnership rediscovered South Pass and a rich beaver country on Green River where they moved. Later the group was known as the Rocky Mountain Fur Company. About 1829, John Jacob Astor's American Fur Company began trading from Fort Union near the mouth of the Yellowstone. The rivals fought bitterly over all of what is now Montana, and on Ruby Creek the daring trapper William Henry Vanderburgh was killed by Blackfeet. The resources of the Rocky Mountain traders were soon exhausted and the western department of the American Fur Company dominated the upper Missouri until past the middle of the century.

David Thompson, in the employ of the Canadian Northwest Company, first explored northwest Montana and in 1809, built "Saleesh House" on Clark Fork near Thompson Falls. Many traders traversed the Clark Fork country with parties led by Alexander Ross, Peter Skene Ogden, John Work and others. From Astoria, the post Astor had founded on the Columbia River, came American traders but their efforts accomplished little. The Treaty of 1846 ended British occupation but the Hudson's Bay Company traded in Montana for many years.

Missionary efforts were contemporary with the fur trade. Urged by Flatheads, Father Pierre-Jean De Smet established St. Mary's Mission in

the Bitterroot in 1841. This mission was at first successful, but an influx of whites and other difficulties led to its closing, and in 1850 the mission property was transferred to an ex-army sutler, "Major" John Owens, who used it as a trading post for more than 30 years.

After the gold rush to California, projects for a transcontinental railroad resulted in the Stevens survey of 1855. The railroad was not built then, but Lieut. John Mullan constructed a wagon road from Ft. Benton, head of steam boat traffic on the upper Missouri, to Walla Walla, and over this went pack trains of mules and camels, as well as pony express riders, stage coaches, and freighters.

Discoveries of gold between 1857 and 1863 produced a gold rush to this region. Bannack on Grasshopper Creek, Virginia City on Alder Gulch, and Helena on Last Chance Gulch soon became populous communities. Missoula, Deer Lodge, Rozeman, and other settlements became supply depots for mining communities. Bandits known as road agents preyed upon unlucky miners who had found gold, and the miners struck back by organizing as vigilantes in December 1863, and soon executed or frightened from the country all known road agents.

The gold rush which brought miners to both sides of the Rocky Mountains and the resulting lawlessness made necessary an organized government. In 1863 Idaho Territory was organized and included practically all of later Montana. On May 26, 1864, Montana Territory, so christened by James Ashley, then a congressman from Ohio, was formed from eastern Idaho.

Indian uprisings against the settlers began in the late 1860's. The Sioux were most implacable and their enmity culminated on June 25, 1876, at the Battle of Little Big Horn when Gen. George A. Custer and his entire command were killed. The next year, the Nez Percés of Idaho under Chief Joseph, seeking to escape confinement on a reservation, made a dramatic march across Montana until they were forced to surrender, Oct. 5, 1877.

In the decade of the 80's, construction of the Northern Pacific Railway gave an impetus to agriculture and stock raising. The 90's were characterized by feuds between the "copper kings" William A. Clark, Marcus Daly, and F. Augustus Heinze. These feuds were not only for control of the copper industry but involved state politics. This period marked also a demand for free coinage of silver, supported by miners and debt-ridden farmers anxious for inflation.

After the turn of the century, farming prospered and farmers complained that the mines escaped their fair share of taxation, thus imposing an undue burden upon agriculture. Their complaints led to a license tax on mines in 1924.

The decade following World War I was characterized by growing unrest among farmers and laborers. The period began conservatively in 1920 when former Senator Joseph M. Dixon defeated the rising young radical leader, Burton K. Wheeler, for governor, but the people later turned towards the federal government for a solution of their problems. Senators Thomas J. Walsh, and Wheeler, who was elected two years after his defeat for the governorship, both worked for federal assistance in reclamation, lower freight rates, and farm relief.

The depression, beginning in 1929, hit heavily. Farmers received so little for their produce that

they had nothing left after paying freight to markets. Mass unemployment followed the closing of mines and suspension of lumbering. Beginning in 1933, the federal government poured vast sums into the state for relief projects, farm assistance, road building, and reclamation, particularly the great Fort Peck project. Public opinion, radical for two decades, drifted towards conservatism. In 1946, Leif Erickson, a prominent liberal, was defeated for the senate by a pronounced conservative, Zales N. Ecton. Economic groups tended to urge their particular interests. Sheep and cattle men called for higher protection, and better access to the public domains. Farmers were interested in federal support prices. General interest focused on reclamation and power development. Representative Michael J. Mansfield, a university professor turned politician, was generally applauded for his efforts in western Montana to build the great Hungry Horse Dam, a project which had been agitated for more than 20 years. A hearing by army engineers on a proposal to dam Clark Fork River below Paradise to regulate the flow of water at Grand Coulee Dam aroused bitter opposition. The lake formed above the dam would inundate the valleys of the Flathead and Clark Fork rivers for many miles and deprive many whites and Indians of their homes. It would force the Northern Pacific Railway to seek a new route over the mountains between Missoula and Spokane. Representative Mansfield suggested, as an alternative, a dam near Glacier Park. Opinions on further development of power and irrigation in eastern Montana were sharply divided. Senator James E. Murray supported a Missouri Valley Authority and, early in 1947, introduced a bill to establish it. Governor Sam Ford opposed this and urged that irrigation be carried out by the Bureau of Reclamation and that power sites be constructed by army engineers. The question came before the courts through an order of the Federal Power Commission declaring the upper Missouri navigable and thus subject to federal regulation. The Montana Power Company, which controls most of the hydroelectric power developed in the state, objected and the dispute was carried to the Supreme Court.

In the campaign of 1948, the Democrats carried all state offices. The new governor, John W. Bonner, recommended extension of social security, increased aid to education and expansion of highway construction. The legislature followed cautiously, seeking to avoid increases in taxation. It endorsed the governor's program to attract population to the state by development of new industries, and advertising the appeal of beautiful scenery. Support of the expected settlers depends upon the wise utilization of water.

MONTANA NATIONAL BISON RANGE AND HERD.

—The range is in western Montana, along the Northern Pacific Railroad between Ravalli and Dixon. The tract set apart for the home of the herd contains approximately 18,000 acres, with both grazing land and timber. In the center is a mountain about 2,500 feet high, with grassy slopes and wooded ridges. In the north side of the range several miles of Post Creek are included. On the south side the range takes in about a mile of the Jocko River. The interior are several large springs. The place is ideal for buffalo. It is estimated the food supply is sufficient for a herd of from 1,500 to 2,500 animals. The range was selected by Prof. M. J. Elrod, of the University of Montana, for the American Bison Society, with W. T. Hornaday, then president. In 1908 Senator Joseph Dixon of Montana introduced in Congress a bill to provide for the purchase of the range and for fencing. This became a law in May 1908.

The American Bison Society raised a fund of approximately \$10,500 for the purchase of bison for the range. Thirty-seven animals made the nucleus of the present herd which numbered in 1940 about 437.

MONTANA SCHOOL OF MINES, a State institution founded in 1893. It is located at Butte, one of the leading mining centers of the world, and is open to both men and women. It offers courses in mining, metallurgical and geological engineering, confining its work exclusively to education in the field of the mineral industry. It was endowed with a land grant of 100,000 acres, the income from which approximates \$30,000 annually. The departments of instruction include chemistry, English, economics, geology and mineralogy, mathematics, metallurgy, mineral dressing, mining engineering and physics. The undergraduate course of instruction covers four years. The degrees given are the B.S. and the M.S. Approximate annual enrollment is 375.

MONTANA STATE COLLEGE, a co-educational institution, founded in 1893 and located at Bozeman, Mont. In 1913 it was, by an act of the state legislature, made one of the component parts of the University of Montana. It was endowed with a land grant of 140,000 acres of which 41,543 acres were sold, some years after the institution was founded, for cash and deferred payments amounting to \$562,423.99. Within recent years the number of students has increased. The enrolment in 1933-1934 was 1,034 students; in 1947-1948 it was 3,664. These figures are exclusive of those enrolled in short

courses. The institution offers courses in engineering, agriculture, science, household and industrial arts. The state experiment stations, both for agriculture and engineering, are connected with the college. The college receives the benefit of the several federal acts providing support for the land-grant colleges, as well as state support. The income from all sources in 1938-1939 was \$385,239. This does not include dormitory funds, building funds, etc., but is money spent for operation of the college proper. The state appropriation was \$158,250. The plant value is \$3,916,359. The degree of bachelor of science is given for the completion of the various courses, and graduate work in specified departments is offered with the master of science and professional engineering degrees. Short specialized courses in agriculture and agricultural education are offered. The buildings are modern and of permanent construction.

MONTANA STATE NORMAL COLLEGE.

The. One of the six components of the University of Montana. The institution is located at Dillon and was created by act of the state legislature in 1893. In March 1913, the several higher institutions of the state were constituted the University of Montana. The first chancellor assumed his duties in 1916, at which time the Normal College became a part of the university through methods of administration.

MONTANA STATE UNIVERSITY.

originally the University of Montana, made one of the six component parts of the latter by legislative act of 1913, is located at Missoula. Established by the state legislature in 1893, the doors of the institution were opened Sept. 10, 1895, with 50 students and five members of the faculty. In 1947-1948 the faculty numbered 158 and the total number of students was 3,694.

Courses are offered in the College of Arts and Sciences in bacteriology, botany, chemistry, classical languages, economics, and sociology, English, fine arts, geology, history, and political science, home economics, library economy, mathematics, medical technology, modern languages, nursing education, physical education, physics, psychology, zoology and wild life technology. The degrees conferred are bachelor of arts and bachelor of science and the corresponding master's degrees. Women are admitted on equal terms with men. The income is derived from a small federal land grant income, in greater part from legislative appropriation, and from student fees. The campus contains about 100 acres, with an adjoining portion of Mount Sentinel of 520 acres, and in addition 20,216 acres in the Montana Forest and Conservation Experiment Station in the Blackfoot Valley and 160 acres in the Biological Station at Flathead Lake.

MONTANELLI, mōn'ta-nēl'lē, Giuseppe,

Italian author and patriot: b. Fucecchio, January 1813; d. there, June 17, 1862. He studied law. He became counsel, writing at the same time on philosophical subjects and (1836) issued a volume of lyric poetry. In 1840 he was made professor of Italian and commercial law at Pisa. He founded the Society of Fratelli Italiani (1844), started (1847) the periodical *L'Italia*, fought at Curtatone (1848) and was made (1849) a member of the triumvirate with Guerrazzi and Mazzini. He was given a mission in

Paris, from whence he issued a series of works of a striking character such as 'Memorie sull'Italia e specialmente sulla Toscana dal 1814-1850' (Turin 1853-55); 'La sensazione' (Paris 1856), a dramatic poem; 'Camma,' a gripping tragedy; also the political works, 'Il partito nazionale italiano' (Turin 1856); 'L'impero, il papato, la democrazia in Italia' (Florence 1859). In 1859 he was again called to arms and (1862) was elected to Parliament. Consult Provenzal, 'Alla cara memoria di Giuseppe Montanelli' (Leghorn 1862); Redi, Ricardo, 'Biografico di Giuseppe Montanelli' (Florence 1883); Orlando, 'Il Montanelli poeta,' in *Marzocco* (ib. 1910).

MONTANISM, mon'-, the religious system of Montanus (q.v.).

MONTANITE, a mineral consisting of the hydrated oxides of bismuth and tellurium, and having the formula $\text{Bi}_2\text{O}_3 \cdot \text{TeO}_2 \cdot 2\text{H}_2\text{O}$. It occurs as an incrustation, frequently in connection with the mineral teradymite, from which it is often formed by alteration. It is soft and opaque with a waxy lustre, and is variable in color. Montanite is found at Highland, Mont., and also in Davidson County, N. C., and at Norongo, N. S. W.

MONTANUS, mōn-tā'nūs, Phrygian sectary of the middle of the 2d century A.D. Of him practically nothing is known save in connection with his sect, the Montanists. He was a heathen priest, a native of Ardahan; was converted to Christianity about 156; and about 171 A.D., proclaimed himself the Paraclete or Comforter promised by Jesus. He soon gathered around him a group of followers who believed with him that he was the mouthpiece of the Holy Spirit, as were his companions Prisca, or Priscilla, and Maximilla, each of whom had left her husband to join Montanus. Both these women uttered prophecies, but like Montanus claimed to be only the passive agents of the Holy Ghost. Montanus' principal tenets, apart from his belief that every believer may be the means of special revelation, were largely millenarian; in view of the approaching end of the world he enjoined asceticism, strict church discipline with the exclusion of all offending members, the terrible effect of mortal sin and the incompetency of the Church to forgive it. He and his followers counted it sin to attempt escape from persecution. He was excommunicated with his followers about 175, and died soon after; Maximilla, the last of the prophets, died in 179. His teaching spread after his death, his most notable disciple being Tertullian (q.v.). The sect soon died out in the West, but survived in the East until the time of Justinian, when it was suppressed. Consult Bonwetsch, 'Geschichte des Montanismus' (1881); Erlangen, De Loyres F., 'Montanism and the Primitive Church' (Cambridge 1878).

MONTARGIS, mōn-tār-zhē, France, a town in the department of Loiret, 47 miles east by north of Orleans. It is a manufacturing town with an important trade in paper, cotton goods, leather, shoes, chemicals and agricultural produce. Mirabeau was a native; the castle anciently a favorite residence of the reigning family was called 'The Royal Cradle,' and here in 1371 occurred the famous judicial combat between the 'dog of Montargis' and Macaire, its mas-

ter's murderer. The dog not only showed the spot in the forest of Bondy where its dead master was buried, but singled out the murderer, and when Charles VI granted the ordeal of battle to test his guilt, the dog flew at his throat and so proved its charge upon his body Pop. 13,000.

MONTAUBAN, mōn-tō-bōn, France, capital of the department of Tarn and Garonne, on the Tarn, 342 miles south by west of Paris. It is situated on a plateau surrounded by the Tarn, the Tescou and a deep ravine. The cathedral, episcopal palace, hôtel de ville and the bridge over the Tarn are its principal features. Montauban has manufactures of silk bolting cloths, of common cloths, colors, porcelain, starch, candles, etc.; silk and wool spinning-mills, dyeworks, potteries, etc. During the religious wars, in France, Montauban was a stronghold of the Huguenots, and was besieged in 1580 by Montluc, and in 1621 by the troops of Louis XIII, without success; but it was taken in 1629 by Richelieu, and its walls razed to the ground. The Protestants maintain both an academy and a theological college. The artist Ingres was born at Montauban; many of his pictures are in the museum and his celebrated 'Vow of Louis XIII' hangs in the cathedral Pop about 20,000.

MONTAUK INDIANS, an American tribe of the Algonquin family formerly occupying the extreme eastern end of Long Island, N. Y. They were formerly a powerful people, but a pestilence in the 17th century reduced their number to less than 1,000. Since 1903 only about a dozen of the Montauk tribe survive on Long Island.

MONTAUK POINT, N. Y., the eastern peninsular promontory of Long Island, in Suffolk County, with lighthouse and life-saving stations, the lighthouse, in long. $41^\circ 4' \text{ N.}$; lat. $71^\circ 51' \text{ W.}$, being built of stone, 170 feet high, and its light visible 19 miles. The peninsula has a height of from 50 to 100 feet above the sea, is rolling and wooded and noted for its bracing healthful climate. Here in 1898 Camp Wiko was established for the sick, wounded and convalescent soldiers who had served in the Spanish-American War.

MONTAUSIER, mōn'tō'zyā, Charles de Sainte-Maure, MARQUIS DE, French diplomat b. 6 Oct. 1610; d. 17 May 1690. He entered the army young, distinguished himself in Italy and Lorraine and in his 28th year became major-general. After seceding from the Reformed Church and subscribing to the Catholic faith (1645) he was created lieutenant-general and governor of Saintonge and Angoumois. He remained true to the court during the Fronde war and, in 1665, he was raised to marquis and peer, being appointed guardian of the Dauphin in 1668. In 1680 he was made chief chamberlain. Under his supervision Bosquet and Huet edited the classical writers in *Usus Delphini*. He was distinguished for strict morality and love of the truth, in fact his character was inclined to be sombre, from which fact he was used by Molière as the original Misanthrope. He married Julie Lucine d'Angennes, daughter of Marquis de Rambouillet, a lady of great beauty and whose talents made their home the centre of the most noted sages

and artists of the day, notably Jean Racine and Nicolas Boileau-Despréaux.

MONTBELIARD, môn-bā-lyà', commune, France; in Doubs Department. It is situated 43 miles east-northeast of Besançon, on the Rhine-Rhône Canal and the Paris-Lyon railway. There is a Protestant church, St. Martin's, which was built in the 17th century; and a monument to the naturalist Georges Cuvier (1769-1832), who was born here. Montbéliard is in an industrial region, has foundries and cotton mills, manufactures clocks, and has a considerable trade in lumber, cheeses, and wine.

The town grew up around the medieval castle of the counts of Montbéliard, which was rebuilt in 1751. With the surrounding area, it became a countship of the Holy Roman Empire, passing by marriage to Württemberg in 1397. It was repeatedly occupied by the French (1674-1697, 1723-1748, and 1793-1801), becoming French territory in 1801 by the Treaty of Lunéville. Pop. (1946) 13,596.

MONTCALM DE SAINT-VERAN, môn-kalm' dē sān-vā-rān' (Anglicized môn-tām), MARQUIS **Louis Joseph de**, French soldier: b. near Nîmes, Feb. 29, 1712; d. Quebec, Sept. 14, 1759. He entered the army at 15, distinguished himself in the War of the Austrian Succession, and gained the rank of colonel. He was wounded at the Battle of Piacenza, Italy, in 1746, and was promoted brigadier general the next year.

In 1756 he was promoted to major general and was sent to command the French troops in Canada, where he began operations against the British with great activity and success. Fort Ontario at Oswego was carried on Aug. 14, 1756, after a well-conducted attack, and French control of the lake was restored. The next year (Aug. 9, 1757) he took Fort William Henry, at the head of Lake George, which was held by a garrison of over 2,500 men; and thus became possessed of 42 guns and large stores of ammunition and provisions. In the campaign of 1758 he occupied the strong position of Fort Carillon (Ticonderoga), made it still stronger by entrenchments, and on July 8 held it with 3,600 men against a British force of over 15,000 led by the incapable Gen. James Abercromby.

His personal bravery gained him great popularity among his soldiers; but want of energy on the part of the home government, the scarcity of food all over New France, and personal dissensions between himself and the civil governor, the marquis de Vaudreuil-Cavagnal, forbade him to look for much assistance. Montcalm expressed his conviction that in a few months the English would be masters of the French colonies in America; yet he prepared as best he could for the campaign of 1759. The English had sent strong reinforcements and were preparing for an attack on Quebec. As the success of the whole campaign and indeed the conquest of Canada depended upon the taking of that city, Montcalm concentrated his principal forces on the banks of the Montmorency River to protect it. In the first attack, July 31, the English general, James Wolfe, was repulsed; he later succeeded in landing his troops above Quebec, and on September 13 brought his whole force to the Heights of Abraham. Montcalm at once opposed his advance, but though he led the attack in person, his more numerous but inferior troops broke before the

fire of the British. Wolfe fell in the moment of triumph; Montcalm was mortally wounded and died the next morning.

Consult Parkman, F., *Wolfe and Montcalm* (Boston 1884); Chapais, T., *Le marquis de Montcalm* (Quebec 1911); Lichtenberger, A., *Montcalm et la tragédie canadienne* (Paris 1934); Robitaille, G., *Montcalm et ses historiens* (Montreal 1936).

MONTCEAU-LES-MINES, môn-sô'lā-mên', commune, France; in Saône-et-Loire Department; nine miles south-southwest of Le Creusot, which it supplies with coal. It is a center of coal mining, lime burning, and copper foundries, and has hosiery factories. Pop. (1946) 26,902.

MONTCHRETIEN, môn-krā-tyān', **Antoine de**, French playwright and economist: b. Falaise, Calvados, about 1575; d. Tourailles, near Domfront, Orne, Oct. 8, 1621. He was at first an adventurer, and having killed his adversary in a duel, fled to England about 1605. He returned to France in 1611 and established iron-works at Oussonne-sur-Loire and later at Châtillon-sur-Loire. He was killed while taking part in a Huguenot uprising.

Among his tragedies are *Sophonisbe* (1594), *Aman* (1599), and *L'écossoise, ou Marie Stuart* (1601). His most important work was *Traité de l'économie politique* (1615; new ed. by T. Funck-Brentano, Paris 1889), a treatise on the French economy of the time. Montchrétien condemns monopolies; and advocates protection for the most important industries, freedom for the others.

MONTCLAIR, môn-tklār, town, New Jersey; in Essex County; altitude 240 feet. It is situated six miles north-northwest of Newark and is served by the Delaware, Lackawanna and Western, and the Erie railroads. Montclair is a residential suburb of Newark and New York City, with an active local trade and manufactures of metal items, paints, and chemicals. It is noted for its fine homes, schools, churches, and civic and social organizations. There are three hospitals, an art museum, and a public library. New Jersey State Teachers College (founded 1908; coeducational) is in Upper Montclair, part of the town. Montclair was the home of the painter George Inness from 1878 until his death in 1894. The first settlement was made about 1666. Montclair was part of Bloomfield until 1868, when it seceded and incorporated. It has commission government. Pop. (1950) 43,927.

MONTDIDIER, môn-dē-dyā', commune, France; in Somme Department; 21 miles south-east of Amiens. It is a market center for the surrounding country, has tanneries, and manufactures leather goods. There are two churches dating from the period of the 15th and 16th centuries. Montdidier dates from Merovingian times, and became a royal fief in the 12th century. During World War I it was heavily damaged in the fighting for Amiens in 1918, and again suffered in World War II. Pop. (1946) 4,601.

MONTE CARLO, môn'tē kār'lō, commune, Monaco, situated about a mile north of the capital of the principality; celebrated for its luxuriously appointed casino, founded in 1856, the most famous gambling establishment in the world. Monte Carlo is also noted for its scenic surroundings, its mild, healthful climate, and its attractive

appointments of perfect roads, magnificent gardens, handsome promenades and elegant residences. Its situation on an isolated elevation overlooking a bay of the Mediterranean is particularly beautiful. The "Association of the Watering-Place and Strangers Club of Monaco," with a capital of \$6,000,000 in 60,00 shares, held the contract, which was made with the late M. François Blanc to expire in 1913, whereby the reigning prince was paid annually the sum of \$350,000 for the concession to play. The society in 1898 was granted an extended concession to 1947, for a cumulative decennial increase in its annual payment; it originally bore the cost of the government of the principality but now contributes less than 10 per cent of the total expenses. Roulette and trente are the principal games played. Pop. (1947) 7,967. See also **MONACO**.

MONTE CASSINO, a Benedictine abbey near Cassino (q.v.), Italy, founded by St. Benedictine in 529, on the site of a temple of Apollo. It was destroyed several times between the 6th and the 10th century, the present buildings date from 1637-1727. Since 1866 it has been a national monument, and the abbot became the guardian.

MONTE ROSA. See **ROSA**, **MONTE**.

MONTE SAN GIULIANA, mōn-tā sǎn jōōl-yā'nō, Italy, town in the Sicilian province of Trapani and located 2,540 feet above sea-level on an isolated mountain, the Eryx of the ancients. Remains of the old Phoenician walls still exist and a few remnants of the ancient temple of Aphrodite as well as the cistern (Venus spring). It has a 14th century church and a castle affording a magnificent panoramic view. Its industrial life consists of olive culture and marble quarries. Pop. (1936) 32,933.

MONTEBELLO, mōn-tā-bēl'ō, Italy, village in the province of Pavia, situated on the Coppa. It is noted through two battles fought here. The first occurred June 9, 1800, and is frequently called the Battle of Casteggio, in which General Lannes defeated the Austrians thereby gaining the title duke of Montebello. The second, fought May 20, 1859, was won by the French under Forey, while the Austrians were commanded by Stadion. Pop. 2,183.

MONTECRISTO, mōn-tā-krēs'tō, or krīs'tō, a small island in the Mediterranean belonging to the Italian province of Leghorn, 28 miles south of Elba. In the 16th century it was ravaged by pirates, and as it is rocky and barren, rising 2,126 feet above the sea, it long remained uninhabited. A penal agricultural colony briefly from 1873, it passed to private hands, the last private owner being Victor Emmanuel III. The elder Dumas borrowed its name as title for his hero of *The Count of Monte Cristo* (q.v.).

MONTECUCCOLI or **MONTECUCULI**, mōn-tā-kōō'kō-lē, Raimund, Austrian commander: b. near Modena, Feb. 21, 1609; d. Linz, Austria, Oct. 16, 1680. He entered the Austrian service and served during the Thirty Years' War with great distinction. After the Peace of Westphalia (1648) he visited Sweden and England in a diplomatic capacity; and in 1657 the emperor

sent him to the aid of the king of Poland against Rakoczy and the Swedes, and next year he assisted the Danes against the latter. In 1664 he gained a great victory over the Turks after having driven them out of Transylvania. In 1673 he was placed at the head of the imperial troops and checked the progress of Louis XIV by the capture of Bonn and by forming a junction with the prince of Orange in spite of Turenne and Condé. Montecuccoli's subsequent advance into Alsace was repulsed by the prince of Condé. His last military exploit was the siege of Philippsburg. The Emperor Leopold made him a prince of the empire and the king of Naples gave him the duchy of Melfi. His memoir on the Turkish war, written in Italian (1703), was translated into several languages.

Consult Campori, *Raimondo Montecuccoli, la sua famiglia e i suoi tempi* (Florence 1876); Grossmann, J., *Raimund Montecuccoli* (Vienna 1878).

MONTEFIAScone, mōn-tā-fyās-kō'nā, Italy, town in the province of Rome and circumscribed of Viterbo, situated on a hill to the southwest of Lake Bolsena and on the Attigliano-Viterbo Railway. It is the see of a bishopric and has among its most prominent buildings a beautiful cathedral, a Romanesque church (San Flaviano), a 16th century castle, etc. The muscatel wine cultivated here is known as "Est, Est, Est," which has some connection with the grave inscription here dedicated to the Canon John von Fugger. Pop. (1936) town 3,307; commune 11,277.

MONTEFIORE, mōn-tē-fī-ō'rē, Claude Joseph Goldsmid, English author and Jewish communal worker: b. London, 1858 d. London, July 9, 1938. He studied at Balliol College, Oxford; identified himself with Hebrew charities and educational movements in London; was president of the Jewish Historical Society (1899-1900); and was head of the Anglo-Jewish Association, the Jews' Infant Schools, etc. With Israel Abrahams he edited *The Jewish Quarterly Review* and wrote a series of sermons, *Aspects of Judaism* (1895). He has published besides the Hibbert Lectures for 1892, *The Origin of Religion, Illustrated by the Ancient Hebrews: Liberal Judaism* (1903); *The Synoptic Gospels* (1909); *Some Elements of the Religious Teachings of Jesus* (Jowett Lectures, 1910); and *Rabbinic Literature and Gospel Teachings* (1930). He also selected and arranged the *Rabbinic Anthology*, published in 1936.

MONTEFIORE, Sir Moses Haim, Anglo-Italian philanthropist: b. Leghorn, Italy, Oct. 24, 1784; d. Ramsgate, England, July 28, 1885. He was descended from a wealthy family of bankers; was educated in London; became a leading member of the Stock Exchange; and retired from active business in 1824. From that time he devoted himself to the service of his race, working for the removal of disabilities and oppression under which the Jews in England and elsewhere had suffered great hardship. His wife, whom he married in 1812, was Judith Cohen, a relative of the Rothschilds, and in her Montefiore found a companion who entered ardently into his philanthropic undertakings. He was for a time high sheriff of Kent, and after long exclusion and repeated

election was legally recognized as sheriff of London in 1837. In that year he was knighted and in 1846 raised to a baronetcy in recognition of his meritorious public services. He distinguished himself by his practical sympathy for his race in various countries, chiefly in Poland, Russia, Rumania and Damascus. He made seven journeys to the East, the first in 1827, and the last in 1874, mainly for the amelioration of the condition of the Jews. At Bucharest during an anti-Jewish tumult, he boldly faced the mob at the risk of his life. In 1865 he endowed a Jewish college in memory of his wife, who died three years before, at Ramsgate, where he passed the last years of his life, lying there in his 101st year. In his 100th year he was a type of hale and venerable manhood.

MONTEGO BAY, West Indies, harbor on the north coast of the island of Jamaica. It contains a teachers' seminary, hospital, etc., and has a considerable export trade in fruits and other produce. It is the seat of an American consular station and has about 7,000 inhabitants.

MONTELEONE DI CALABRIA, mōn'-tā-lā-ō-nā dē kə-lā-brē-ā, Italy, capital of a circuit in the province of Catanizara, near the Gulf of Sant Eufemia and located on the Naples-Reggio Railway. It contains the ruins of the castle built by Frederick II, and also of the 15th century San Michele Church, besides a lyceum and grammar school. Its commerce consists chiefly of silk and oil production. The town was utterly destroyed by earthquake in 1783, and again much injured in 1905. It has about 13,000 inhabitants. Consult Pignatari 'Sunto di notizie storiche intorno alla città di Monteleone' (Monteleone 1896).

MONTELMAR, mōn'tā-lé-mär, France, capital town of the arrondissement in department Drôme, located at the juncture of the rivers Roubion and Jahron on the Mediterranean Railway. It contains an ancient castle, now a prison, with a Romanesque chapel, a college, library, museum, Chamber of Agriculture, etc. Among its manufactures are hats, silks, paper goods, agricultural instruments and its noted almond candy (nougat). It has also considerable trade in silk, wine, truffles, lime, etc. The town receives its name from Adémar de Monteil who rebuilt it after its destruction, in the 10th century, by the Saracens. In the 15th century the town fell into the possession of the French Crown. It withstood the siege of Coligny heroically in 1570 but was taken by the Huguenots in 1587.

MONTEMAYOR, mōn-tā-má'yōr, Montemor Jorge, Spanish-Portuguese poet and novelist: b. about 1520; d. 1561. His real name was Montemór, but it assumed the Spanish form Montemayor in Spain. There is little definitely known of the life of Montemayor. He was one of the poet musicians of his day who found refuge and welcome at the Spanish court where he was already on familiar terms in 1548. Six years later he accompanied Juana, the Infanta, to Lisbon where she was to be married to Dom João. He seems to have visited England and Holland with Philip II, and he may have been in Paris. He was assassinated in 1561. His most famous work is a pastoral novel entitled

'Diana Enamorada' (Madrid, between 1545 and 1559). Inflated in style, artificial in its depicting of character, indifferent in poetical value yet, as Cervantes had said, "it has the honor of being the first of the books of its class." Partly in verse and partly in prose, the latter is much the superior. The 'Diana' is written principally in Spanish, but it contains songs and prose passages in Portuguese. It became immensely popular and was widely imitated not alone in Spain but in the other countries of southern and western Europe. It was translated into English by Bartholomew Young in 1583 and published in 1598 and was very widely read in England. Sidney's 'Arcadia' probably owed its existence to the 'Diana' and it was certainly strongly influenced by it; and Shakespeare, in 'Two Gentlemen of Verona' and in parts of other plays shows the effect that the 'Diana' had already had upon English literature. Montemayor's work, being modeled on the Italian pastoral novel which had, to a certain extent, already had its influence upon English literature, the 'Diana' found the proper soil in which to plant itself. Montemayor, who had not finished the 'Diana Enamorada' at the time of his death, left instructions that it should be completed by Dr. Alonso Pérez of Salamanca who wrote accordingly 'Segundo del Salamantino' in 1564. In the same year Gil Polo wrote a second 'Diana Enamorada.' Both of these books are patent imitations of Montemayor's novel. Scores of other imitations followed, among the authors thereof being no less personages than Cervantes and Lope de Vega. The 'Cancionero' of Montemayor (2 vols., Antwerp 1544-58) contains some of his own lyrics. An edition of Montemayor's works was published in Barcelona in 1886.

MONTENEGRO (Serb, CRNA GORA, Black Mountain), formerly an independent kingdom; now one of the six autonomous republics which make up the Federal Peoples Republic of Yugoslavia. Covering 5,342 square miles and with a population of 360,044 (1931 census; prelim. 1948, 376,573), it lies in the southwestern part of Yugoslavia, bounded on the southeast by Albania, on the southwest by the Adriatic Sea, and on the remaining sides by other regions of Yugoslavia (Dalmatia, Hercegovina, Serbia). There are few towns in Montenegro. Titograd (formerly Podgorica; pop. 1948, 12,206) is the capital. Cetinje was the historic capital. Other

cities are Nikšić, and the two ports of Bar (Antivari) and Ulcinj (Dulcigno).

The country is a succession of elevated ridges, with some lofty mountain peaks, of which the highest is Mount Durmitor (8,294 feet), and a few beautiful and verdant valleys in which the soil is tolerably fertile. The principal river is the Morača, with its chief tributary the Zeta; it flows into the Lake of Scutari which is on the Yugoslav-Albanian border. Forests of oak, ash, beech, fir, and poplar cover many of the mountainsides.

Corn, potatoes, vegetables, and several kinds of fruit are grown, but the country is a food-deficit area. Pigs, sheep, and goats are raised in considerable numbers. Agricultural methods remain primitive. Manufacturing industry is virtually nonexistent. Fishing, carried on principally in the Lake of Scutari, is one of the major industries.

The Montenegrins belong to the Serbian branch of the South Slav peoples. Physically, they tend to be tall, well-proportioned, and robust. The women are often beautiful when young but soon lose their good looks because of the unceasing hard work which they perform. Throughout its history Montenegro has been known as a land of violence, where all men go fully armed. At the same time, the people are noted for their hospitality. They speak the Serbo-Croat language, using the Cyrillic alphabet (q.v.). In religion they are mostly all of the eastern Orthodox Church.

History.—Montenegro formed a part of the ancient Roman province of Illyria. During the barbarian invasions (5th century A.D.) it existed as the Serbian principality of Zeta and later formed part of the great Serbian empire of Stephen Dushan (Stevan Dušan, Uroš IV) which for a brief period in the mid-14th century included most of the Balkan Peninsula. After the overthrow of that empire and the disastrous defeat of the Serbs by the Turks at Kosovo in 1389, Montenegro maintained in succeeding centuries a *de facto* independence. Turkish armies made many attempts to subdue the country but, because of the difficulties of the terrain and the tenacity of the people, were never more than partially successful. From 1516 Montenegro was governed by a prince-bishop, or *vladika*, first elective but after 1696 hereditary in the family of Petrović. Early in the 18th century were established the close relations with Russia which were maintained for 200 years. In 1796, Prince Peter I (r. 1782-1830) inflicted such losses on the army of the pasha of Scutari, who had invaded Montenegro, that for many years the Turks left the country unmolested. Peter II (r. 1830-1851), who was a noted poet, made strenuous efforts to improve the condition of the people and to liberalize the governmental system. Peter's successor, Danilo I or II (r. 1851-1860), separated the princely from the ecclesiastical office, retaining only the former. His reign was marked by an epic victory over the Turks at Grahovo in 1858 known as the Montenegrin Marathon. Assassinated in 1860, Danilo was succeeded by Prince Nicholas, who reigned for 50 years as prince and for six more as King Nicholas I of Montenegro. In 1861, Montenegrins took part in a revolt against Turkish rule in neighboring Hercegovina, and when the revolt was put down Nicholas was compelled to agree to the occupation of a number of points in Montenegro by

Turkish troops. In 1876, Montenegro and Serbia declared war on Turkey following the outbreak of a new revolt in Bosnia-Hercegovina; Russia entered the war in 1877. The Treaty of Berlin (1878), which concluded hostilities, gave Montenegro certain accessions of territory and formally recognized its independence (see BERLIN CONGRESS). Montenegro was a member of the Balkan League (q.v.) of 1912 and fought against Turkey in the First Balkan War, gaining additional territory (see BALKAN WARS). Montenegro joined Serbia when World War I began in 1914 and was overrun by the German-Austrian armies in the following year. While the government proposed to resist to the end, the king attempted to make a deal with the Central Powers but could reach no agreement. When Cetinje was occupied on Jan. 13, 1916, he and his government retired to Neuilly-sur-Seine, France. After the war Nicholas tried, without success, to induce the victorious Allied Powers to restore Montenegrin independence and his throne. Meanwhile, a National Assembly meeting at Podgorica on Nov. 26, 1918, declared the dynasty deposed and voted union with Serbia. Montenegro became a part of the new Kingdom of the Serbs, Croats and Slovenes (Yugoslavia) whose independence was proclaimed on Dec. 1, 1918.

During the inter-war period there was in Montenegro considerable opposition to the centralized administration run from Belgrade (Beograd), although as a compensating factor, many Montenegrins were able to achieve prominence in the broader field of Yugoslav government and politics. The Axis powers naturally attempted to make capital of Montenegrin discontent. When Yugoslavia was defeated and partitioned in 1941, Montenegro was made a protectorate of Italy, garrisoned by Italian troops; on Italian initiative it was declared independent on July 12, 1941. After the Italian surrender in September 1943 German troops occupied the key towns. During the course of the war, Montenegro was the scene of guerrilla activity on the part of both nationalist Chetniks and Communist-led Partisans. Toward the end of the war the latter got the upper hand and remained in effective control when the Germans withdrew.

Under the Tito regime, Montenegro has been given the status of a nominally autonomous "republic" with its own government, although through the centralized apparatus of the Communist Party of Yugoslavia its affairs are under the direct control of Belgrade.

JOHN C. CAMPBELL,
Council on Foreign Relations

MONTENOTTE, mōn-tā-nōt'tē, village, Italy, situated in the commune of Cairo Montenotte, province of Savona, 26 miles west of Genoa. In a battle fought here on April 12, 1796, Napoleon won his first victory over the Austrians in the Italian campaign.

MONTEPULCIANO, mōn-tā-pō(ū)-cha'nō, commune, Italy, situated in the province of Siena, Tuscany, 28 miles southeast of Siena. The town

is picturesquely located on a height (1,950 feet) overlooking the Lake of Montepulciano. It is the trading center of a wine-producing district and has woodworking establishments. Outstanding among its many old buildings are the Palazzo Cervini, designed by the elder Antonio da Sangallo; the Palazzo Contucci, begun by Sangallo in 1519 and completed by Baldassare Peruzzi; the Palazzo Ricci, by Peruzzi; the cathedral (1532-1617), designed by Ippolito Scalza and containing a triptych (1401) by Taddeo di Bartolo; the 14th century Palazzo Communale, which has Della Robbia terra cottas; and the Church of Sant'Agostino, with a Renaissance façade by Michelozzo. At a short distance from the town is the Church of San Biagio, built from 1518 to 1545 from plans by Sangallo. Montepulciano was the birthplace of Robert Cardinal Bellarmine, Pope Marcellus II, and Politian (Angelo Ambrogini). It is the seat of a bishopric and has a museum containing Etruscan antiquities. Pop. (1951) 16,555.

MONTEREAU-FAUT-YONNE, mônt-rô-fô-yôn', town, France, situated in the Department of Seine-et-Marne, at the confluence of the Seine and Yonne Rivers, 17 miles southeast of Melun. Its numerous industrial establishments produce porcelain, pottery, mosaic tiles, bricks, electrical equipment, furniture, hosiery, and food products. It has a church dating from the 13th to 16th centuries and an equestrian statue of Napoleon I.

In Gallo-Roman times the town was known as Condate. The name of Montereau dates from the 8th century, when a monastery was dedicated to St. Martin. In 1419, John the Fearless, duke of Burgundy, was assassinated here by followers of the dauphin (later Charles VII). Nearby, on Feb. 18, 1814, Napoleon won a victory over the Allies. The town sustained some damage in World War II. Pop. (1946) 8,726.

MONTEREY, môn-tê-râ', city, California, situated in Monterey County, on Monterey Bay, 19 miles southwest of Salinas, the county seat. It is served by the Southern Pacific Railroad and by United Air Lines and Southwest Airways. The airport, 3 miles east of the city, is a regular stop between San Francisco and Los Angeles. The harbor is protected by a 1,500-foot breakwater, and the port facilities are municipally owned. Inland, back from the bay, are orchards and stock farms, and the city has fruit and vegetable canneries. Along the coast the leading industries are fishing and fish packing. The principal commercial catch is sardines (pilchards), but abalone, mackerel, albacore, tuna, shrimp, lobsters, and crabs are also taken. The processing of fish oils, fish fertilizer, and fish meal supplements this activity. Del Monte sand, a white sand used in sandblasting stone buildings, is shipped from here.

Monterey spreads over a sloping shore, with residences on the hillsides to the east and mountains farther back from the sea. It pivots on Alvarado Street, which extends from Fishermen's Wharf to the northern end of the city. There are excellent recreational facilities, a public library, and a junior college (Monterey Peninsula College). In the old customhouse (1814) and the first California theater (1844) the state maintains museums; in the former a room is devoted to a collection of manuscripts of writers associated with the area, including Robert Louis Steven-

son and Ambrose Bierce. Other historic buildings include Colton Hall, where California's first constitution was framed; and the chapel (1789) of the presidio. The Presidio of Monterey, now a United States Army post, has in its grounds statues of Father Junipero Serra, who in 1770 founded the Mission San Carlos Borromeo here (it was moved shortly thereafter to Carmel), and Commodore John D. Sloat, who captured the city for the United States in 1846. Nearby are the art and literary center of Carmel-by-the-Sea and Fort Ord.

The site of Monterey was visited by Juan Rodríguez Cabrillo in 1542, and the bay was named by Sebastián Vizcaino in 1602. The first permanent settlement, called San Carlos Borromeo, was made in 1770, when Father Serra and Gaspar de Portolá established, respectively, a mission and a presidio here. Under both Spanish (to 1822) and Mexican rule, Monterey served as the capital of Alta California. On July 7, 1846, the American flag was raised over the courthouse. Three years later a constitutional convention was held in the city, and here the first state legislature assembled. Monterey was incorporated in 1850. Government is of the city manager type. Pop. (1950) 16,205.

MONTEREY BAY, bay, California, indenting the Pacific coast in Monterey and Santa Cruz counties. It is about 26 miles across from Santa Cruz in the north to Monterey in the south and extends inland for about 10 miles. The Salinas River flows into the bay.

MONTEREY PARK, city, California, situated in Los Angeles County, 5 miles east of downtown Los Angeles, of which it is a residential suburb. It is served by the Pacific Electric Railway. There are food-processing plants and factories producing engine parts and toys. Founded in 1910, Monterey Park was incorporated in 1916. Government is of the city manager type, and the water supply system is municipally owned. Pop. (1940) 8,531; (1950) 20,395.

MONTERO RIOS, môn-tá-rô rê'ôs, Eugenio, Spanish statesman and jurist; b. Santiago de Compostela, Nov. 13, 1832; d. Madrid, May 12, 1914. He was educated at the universities of Santiago and Madrid, and in 1864 became a professor of canon law at the latter. Elected to the Cortes in 1869, he served as minister of justice in 1870-1872 and again in 1889. He served as president of the Senate in 1894-1895, and in 1898 was president of the Spanish commission to negotiate peace after the Spanish American War. He was again president of the Senate in 1899, and in 1903 was recognized as the leader of the Liberal Party. He served as prime minister in 1905-1906, and for a third time as president of the Senate, in 1909-1914.

MONTERREY, môn-têr-rê'ê, city, Mexico, capital of the State of Nuevo León, on the Inter-American Highway, 440 miles north-northwest of Mexico City. With the exception of Mexico City, it is the most important manufacturing center in the republic. It is situated at an altitude of 1,624 feet on the Santa Catarina River in a fertile valley surrounded by the eastern foothills of the Sierra Madre Oriental at the northern end of the agricultural section of the state. South of the city is an extensive citrus country of mountainous

valleys and rolling hills, while the arid plains of northern Nuevo León lie immediately north of it. Before its conquest by the Spaniards, the region was inhabited by nomadic Indians. These were subdued during the 1560's, and the area was quickly settled. The town was first named León, receiving its present name in 1596. In the course of the Mexican War, United States troops under Gen. Zachary Taylor stormed Monterrey during a four-day battle in 1846 (see MONTERREY, BATTLE OF). The present city combines traditional Spanish architecture, largely confined to the older residences and public buildings, with numerous outstanding examples of modern industrial and commercial construction. The basis of Monterrey's prosperity is the smelting of iron ores carried on in mills east of the city, and the manufacture of iron and steel products. There are also lead smelters, refineries of nonferrous metals, cement plants, flour and textile mills, soft drink bottling works, and some celebrated breweries. The city is also one of Mexico's leading financial centers. Close commercial ties are maintained with the United States, and the influence of the neighboring country is strong. The city is the major rail and highway center of northern Mexico. It is the seat of the University of Nuevo León (1933) and of a technological institute. Pop. (1940) 186,092; (1950) 339,634.

MONTERREY, Battle of. In the early part of the Mexican War, Monterrey, which occupied a strong natural position and was well fortified, was held by Gen. Pedro de Ampudia with about 10,000 regular troops. In August 1846, Gen. Zachary Taylor, with a force of 6,625 men (mostly volunteers), marched from Matamoras to attack Monterrey. On September 9, he camped within 3 miles of the city. Ten days were spent in reconnoitering, and on the afternoon of September 19, Gen. William J. Worth was ordered to march with his division around the hill occupied by the bishop's palace, to take a position on the road to Saltillo, and to carry the enemy's detached works in that quarter. The main body of the army was to make a diversion against the center and left of the city by batteries erected during the night. On the following morning these batteries opened on the city, which replied with heavy fire from the citadel and other works. The lower part of the city was assaulted and entered by the Americans, and a strong Mexican work was captured after hard fighting by a brigade under Gen. John A. Quitman. Gen. William Orlando Butler entered the city at another point with the 1st Ohio Regiment. Meanwhile, General Worth carried the heights south of the river and the Saltillo road and turned the guns of the Mexicans in that quarter on the bishop's palace. The Mexicans evacuated the lower part of Monterrey during the night, and early in the morning of September 21, General Worth stormed the height overlooking the bishop's palace. By noon the palace itself was taken, and its guns turned on the Mexicans. Since the houses of the city were solidly built and the streets strongly barricaded, the Americans were forced to take each house in succession by breaking through the walls until they reached the main plaza. The conflict lasted until September 23, the Mexicans contesting every foot of ground until only the citadel remained in their possession. On the morning of September 24, General de Ampudia capitulated and with his army was permitted to march out with the honors

of war. United States losses during the battle were 120 killed and 368 wounded. Mexican losses were reported to total 29 officers and 338 men.

MONTES, mōn'tās, Ismael, Bolivian lawyer, statesman, and soldier: b. La Paz, Oct. 5, 1861; d. there, Nov. 18, 1933. He was educated at the University of La Paz and became a member of the bar in 1886. He served as a judge, and in 1890 was elected as a Liberal to the House of Deputies. In 1899 and again in 1903 he served as minister of war, and from 1904 to 1909 was president of Bolivia. During his term of office a boundary dispute with Chile was settled, and progress was made in education, agriculture, and transportation. Montes was minister to France in 1910 and minister to Great Britain in 1911. From 1913 to 1917 he served a second term as president. He was again minister to France in 1917, and from 1920 lived there in exile. Returning to Bolivia in 1928, he became head of the Liberal Party.

MONTESA, mōn-tā'sā, Order of Our Lady of, a Spanish military order established by King James II of Aragon in 1319 after the suppression of the Knights Templars (1312). It was endowed with the latter's estates. In 1587 it became united with the Spanish crown. The order was abolished in 1872, but was re-established two years later. The badge is a gold lozenge with a red cross in the field, surmounted by a trophy on a red ribbon. Knights are divided into two classes

MONTESANO, mōn-tě-sā'nō, city, Washington, seat of Grays Harbor County, situated on the Chehalis River, at the head of tidewater navigation, 10 miles east of Aberdeen. It is served by the Northern Pacific, the Union Pacific, and the Chicago, Milwaukee, St. Paul and Pacific railroads. In a farming, lumbering, and fishing region, the city produces lumber, furniture, and dairy products. First settled in 1854, it was incorporated in 1883. Pop. (1950) 2,328.

MONTESPAN, mōn-těs-pān', MARQUISE DE (nee FRANÇOISE ATHÉNAÏS ROCHECHOUART), mistress of King Louis XIV of France: b. Ton-nay-Charente, near Rochefort, 1641; d. Bourbon-l'Archambault, May 27, 1707. The second daughter of the duc de Mortemart, she was married in 1663 to Louis de Pardaillan de Gondrin, marquis de Montespan. To great beauty she added a natural liveliness and wit and a highly cultivated mind. Soon after her appearance at court in 1660, she attracted the king's attention and in 1667 became his mistress. Until 1674 she shared his favor with Louise de La Vallière. Mme. de Montespan bore eight children to the king, two of whom died in infancy. The older children were entrusted to the care of Mme. Paul Scarron (later Mme. de Maintenon). They were legitimized in 1673. Mme. de Montespan's influence over the king continued until about 1679, when a growing attachment to Mme. de Maintenon finally estranged his affections from Mme. de Montespan. She rarely appeared at court after 1684, and in 1691 she left it entirely. Her last years were spent in retirement, devoted to religious exercises, acts of benevolence, and penitence. One of her daughters by the king, Mlle. de Blois, married Philippe II, duc d'Orléans, who served as regent during Louis XV's minority.

MONTESQUIEU, Charles Louis de
 secondat, Baron de la Brède et de, French
 philosophical historian: b. at La Brède, near
 Bordeaux, 18 Jan. 1689; d. La Brède, 10 Feb.
 1755. He was of a noble family, received an
 excellent education and studied law which was
 his family traditional profession. From his
 father and his mother he inherited titles, prop-
 erty and position, and his uncle, who died in
 1716, left him his whole fortune, his very im-
 portant judicial office of "président a mortier"
 and his old and noble family name of "Montes-
 quieu." The office thus bequeathed him he
 held for 12 years, but his serious occupation
 was writing on philosophy, politics, natural
 science and various other subjects. In 1721 his
 'Lettres persanes' were published at Amster-
 dam anonymously. In these Montesquieu
 satirizes the follies of his age in literature,
 society, politics and religion. So popular were
 these letters that the public called for several
 editions in the first year following their pub-
 lication. They pointed the way to a new field
 in literature and are credited with being the
 first book in the so-called "Philosophes" move-
 ment. Montesquieu became a sort of literary
 lion in Paris and he enjoyed his reputation and
 the peculiar advantages it brought him to the
 full. But to do this he sold the life tenure of
 his office in Brède and removed to the capitol
 in 1726, and two years later he was elected a
 member of the Académie Française. He sud-
 denly resolved upon an extensive tour of Europe
 with the purpose of observing the life of the
 various countries visited. His tour took him to
 Austria, Hungary, Italy, England and the
 Rhine country and occupied nearly four years
 which were very fruitful in the life of the
 author. Returning to La Brède he set up a
 great study hall and library 60 feet long by 40
 feet wide. The result of his work here was,
 in part, 'Considérations sur les causes de la
 grandeur et de la décadence des Romains'
 which was published anonymously in Amster-
 dam in 1734. This became at once popular, not
 alone in France, but all over Europe, and was
 probably the most widely read of all Montes-
 quieu's works. It opened the wide field of the
 philosophy of history. In the meantime he was
 carrying on deep and original researches for
 a still greater work. But he loved the literary
 salons and the brilliant life of Paris and much
 of his time was spent in the capital, however,
 not to the neglect of his literary investigations,
 for the 'Esprit des lois,' the most original
 book of its age, appeared in Geneva in 1748.
 It was published in two volumes comprising in
 all 31 books. Though the 'Esprit' met with
 considerable opposition at first, in France, it
 became popular in other European countries,
 and France soon also fell into line and Montes-
 quieu was looked upon as the greatest literary
 man of his day. His passion for literary work
 continued; but most of his subsequent writings
 remained unpublished during his lifetime.
 His fame continued long after his death and
 for more than a century he was the one great
 authority of the moderate reform party, not
 alone in France, but also in other countries
 where the spirit of reform was abroad. Of all
 the early writers on the science of comparative
 politics and history he easily stands first on
 account of the actual excellence of the work

done, the originality of thought which he con-
 stantly displays and the deep and lasting in-
 fluence he had upon the thought of his own
 day and upon succeeding generations. In France,
 however, Montesquieu's enemies and detractors
 have accused him of being more English than
 French in literary form and in manner of
 thought; and, in fact, so great an admirer was
 he of everything English, that he was looked
 upon, during his lifetime and long afterward
 as an Anglomaniac. Montesquieu is a much
 more rational thinker than Voltaire, though the
 latter far outran him in popularity. The two
 men were, however, so far apart in their modes
 of thought that neither was able to appreciate
 the greatness of the other. The cool, moderate
 reasoning of Montesquieu was not only in
 every way fitted for the age in which he lived,
 but it was couched in language that attracted
 and commended itself to all men of liberal
 tendencies. Thus it was a preparation for the
 work that Voltaire himself was called upon to
 do; and both Montesquieu and Voltaire, though
 working along different lines and imbued each
 with a different spirit, were both on the broad
 road to the Revolution of 1789 and the rejuvena-
 tion of France. In an age when the real spirit
 of all just law was hidden from the sight of
 most men, the original, truthful and clear-cut
 views of Montesquieu on politics and their rela-
 tion to law came as an inspiration and took
 hold of the imagination of thinking Europe.
 He made men think clearly and powerfully
 along lines that they had been unaccustomed to
 think rightly for centuries. His masterly
 genius for generalization may be said to have
 created the science of politics. His plain, un-
 adorned, forceful language and withal beautiful
 composition is in marked contrast to the spirit
 that ruled the literature of his own and the
 following generation. To this simplicity of
 language and directness of thought he owed
 much of his popularity. Montesquieu was well
 known to the more inquiring spirits of the En-
 glish colonies in America and his work had a
 strong influence over the revolutionary spirit
 that began to make itself felt among the
 colonies early in the latter half of the 18th
 century, where, during the struggle for inde-
 pendence, it became a veritable textbook of
 the Revolutionary party. There have been many
 editions of Montesquieu's works published in
 French and in all the languages of Europe. (See
 LES LETTRES PERSANES; SPIRIT OF THE LAWS).

**MONTESQUIOU-FEZENSAC, môn-tès-
 kē-oo-fā-zān-sāk, Robert, COUNT DE, French**
 poet: b. Paris, 9 March 1855; d. 1920. He was
 known as an art collector and as an amateur
 goldsmith and enameler in 1892, when he pub-
 lished 'Les Chauves-souris,' a volume of verse
 symbolizing the mystery of night. It was fol-
 lowed by 'Chef des Odeurs suaves' (1893), of
 which the theme was flowers and perfumes
 'Les Hortensias Bleus' (1896) and 'Perles
 Rouges' (1899), the latter a series of sonnets

evoking the departed glories of Versailles; by *Les Paons* (1901); and by two volumes of essays on neglected artists of distinction.

MONTESSORI, mōn-tās-sô'rê; Angl. mōn-tē-sô'rê, **Maria**, Italian educator: b. Chiaravalle (Ancona), Aug. 31, 1870; d. Noordwijk, the Netherlands, May 6, 1952. Educated in Rome, she was the first woman awarded a medical degree in Italy, the University of Rome conferring on her the M.D. degree in 1894. While practicing as assistant physician at the university's psychiatric clinic Dr. Montessori became interested in child education and pursued studies in psychiatry and pedagogy. In 1898 she founded in Rome the Orthophrenic School for feeble-minded and defective children, applying the principles and methods of Édouard Séguin (q.v.). Her success suggested the idea that they might prove equally valuable in educating normal children. Meanwhile she had been lecturing at the university on pedagogy (1900-1907).

In 1907 she established in Rome the *Casa dei Bambini*, the first Montessori school for normal children and the prototype of many throughout Europe and America which featured the "Montessori Method." Essentially the method consists in encouraging the child's initiative and employing specially prepared teaching materials and games for sense and muscle development. Stress is laid on the child's freedom of expression, and the teacher's function is that of supervisor and guide rather than of formal instructor.

The basic idea of Dr. Montessori's system is that children are essentially serious-minded and educate themselves if only permitted to do so. Instinctively orderly and easily acquiring self-discipline, they have remarkable powers of mental concentration which only require release. At an early age they should be taught to dress and wash themselves. Naughtiness in a child is the expression of some inner disturbance.

Going to Spain in 1917, Dr. Montessori took charge of the Montessori Institute at Barcelona, and two years later directed training courses in London. Returning to Italy in 1922, she was appointed a government inspector of schools. Although Mussolini for some years approved her work, owing to her pacifist ideas he closed all her Italian schools in 1934. Whereupon she returned to her Barcelona Institute. The Spanish civil war forcing its discontinuance, in 1938 she established a training center at Laren, near Amsterdam. In 1939 she went to India to direct a training course at Adyar, Madras. Interned as an enemy alien in 1940, with her adopted son, Dr. Mario Montessori, she nevertheless was permitted to continue her courses at Ahmadabad and trained about 1,000 Indians in her system.

She published several books on her method which were translated into English and other languages. They include *The Montessori Method* (1912); *Pedagogical Anthropology* (1913); *Dr. Montessori's Own Handbook* (1914); *Advanced Montessori Method* (1917). She also published works on religious instruction, and *The Secret of Childhood* (1939).

MONTEVERDE, mōn-tā-vār'dā, **Giulio**, Italian sculptor: b. Bistagno, Oct. 8, 1837; d. Rome, Oct. 3, 1917. A cabinetmaker at Genoa, while still a youth he obtained a scholarship to study sculpture in Rome. The king of Württemberg admiring one of his group pieces purchased

it for the munificent sum of 8,000 lira. The young sculptor's fame was enhanced by his *Columbus as a Boy* and *Genius of Franklin*. His most famous piece is his *Jenner* (1873), showing the great physician inoculating his child.

MONTEVERDI, mōn-tā-vār'dê, or **MONTEVERDE**, **Claudio**, Italian composer: b. Cremona, May 15, 1567; d. Venice, Nov. 29, 1643. A pupil of Marcantonio Ingegneri, he seems to have been well grounded by his master in the contrapuntal method. His first work, the four part *Madrigali spirituali*, was published in 1583, and was followed a year later by his *Canzonette à tre voci*. In 1589-1590 he obtained the post of violinist at the court of Mantua. He was a member of the retinue of Duke Vincenzo I Gonzaga during the ducal travels in Hungary and Flanders. Acquaintance with French models at Spire and Brussels inspired him to write his *Scherzi musicali* (1607) in the French style. Vincenzo gave him the post of choir master at the court (1602); but on his patron's death in 1612, the new duke did not retain him. After a brief visit in his native city Monteverdi proceeded to Venice where, in August 1613, he was appointed choir master of St. Mark's, a post he retained until his death.

Between 1587 and 1605 he published five books of five-part madrigals. His first significant operatic work, *Orfeo*, produced at Mantua in 1607, was followed by *Arianna* (1608), of which only the famous song *Lamento* survives. Most of his operas have been lost, among them *Mercurio e Marti* (1627), *Adone* (1639), and *Nozze d'Enea con Lavinia* (1641). His last operas, *Il ritorno d'Ulisse* (1641) and *L'incoronazione di Poppea* (1642), produced in Venice, and especially the latter with its sensuous re-creation of imperial Rome, securely established an operatic style that spread from Italy throughout Europe.

Consult Schrade, Leo, *Monteverdi: Creator of Modern Music* (New York 1950), and Redlich, Hans F., tr. by K. Dale, *Claudio Monteverdi: Life and Works* (London 1952).

MONTEVIDEO, city, Minnesota, and Chippewa County seat; altitude 922 feet; at the junction of the Minnesota and Chippewa rivers, 133 miles west of Minneapolis; on the Chicago, Milwaukee, St. Paul and Pacific Railroad. It is a trading center for livestock, poultry and dairy products. Leading industries include a packing house, bottling works and three creameries. Named for the Uruguayan capital, it was platted in 1870, incorporated as a village in 1879, and as a city in 1908. A monument in near-by Camp Release State Park commemorates the release of 269 white captives of the Sioux Indians in 1862. Pop. (1950) 5,459.

MONTEVIDEO, mōn-tē-vīd-ā'ō, *Spain*, mōn-tā-vē-thā'ō, city, Uruguay, capital of the department of the same name, and of the republic. It is situated on the estuary of the Río de la Plata (q.v.). Founded in 1726, the inhabitants numbered only 3,500 in 1818, and 9,000 in 1829. Captured by British forces in February 1807, the defeat of Lt. Gen. John Whitelocke's attempt against Buenos Aires in July compelled their withdrawal on September 9.

Demolition of the city walls, opening of new streets, and the beginning of foreign immigration in 1836 caused a phenomenal growth. There were 45,000 inhabitants in 1860; 105,000 in 1872; 238,080 in 1892; and at the beginning of 1902

about 278,186 in the territory of 256 square miles embraced in the department. By 1 Jan. 1930, the population had increased to 655,389.

Montevideo is 125 miles east of Buenos Aires, Argentina. The harbor is considered the best on the Rio de la Plata; but formerly was far from satisfactory. An elaborate system of moles and docks, projected for harbor improvement, began in July 1901. The water at the harbor's entrance being but 15 to 17 feet deep, vessels of great draught formerly anchored in the outer roadstead and discharged their cargoes on lighters. Since 1901 over \$30,000,000 have been expended to increase the port's facilities. The city is built on a chain of hills of moderate elevation with a gradual slope toward the shore; the conditions are therefore favorable for efficient drainage. An active commerce is maintained with foreign countries and towns of the interior. As it is the only port of entry it furnishes nearly all of the revenue of the government, receiving or forwarding about 90 per cent of the importations of the entire country and about 67 per cent of the total exportations. The steamers of 20 different companies, including three British, two French, four German and three Italian lines, visit the port, some regularly, others more or less periodically. Conspicuous buildings are the Parliament House, Government Palace, National Bank, Solis and San Felipe theatres, Uruguay Club and School of Arts and Sciences. There are commercial houses of every class, street railways, telegraph and telephone service, electric-light works, printing establishments and foundries. The streets are wide, straight and generally well kept. The water supply is obtained from the Saint Lucia River, at a point about 12 miles distant. Plazas, 16 in number, occupy high ground in the middle of the city, the most attractive of these public squares being the Zabala, Independencia and Constitución. The Universidad de Montevideo has over 10,000 students, and a very large teaching staff. There are also normal schools, a school of arts and trades, and primary schools. Banks are numerous, and include a branch of the National City Bank of New York. No city in South America is more cosmopolitan in character: nearly all the languages of the civilized world are heard in its streets. The environs contain beautiful residences surrounded by gardens; at a distance of about three miles from the city is the fine park called El Prado.

MARRION WILCOX.

MONTEVIDEO, Department of. See URUGUAY.

MONTEZ, Lola (assumed name of MARIE DOLORES ELIZA ROSANNA GILBERT), adventuress: b. Limerick, Ireland, 1818; d. Astoria, N. Y., 17 Jan. 1861. Her parents took the child to India, where her father died, and her mother, again marrying, sent Lola back to Europe. In 1837 she married a Captain James, went to India with him, tired of him and returned to England in 1842. She next became a public dancer, performing in London and in cities of the Continent, and in 1846 went to Munich, where she fascinated the old artist-king Louis I of Bavaria who made her his mistress, created her Countess of Landsfeld and granted her a large annuity. For a while she also exercised

great political power, which she directed against the Jesuits and in favor of liberalism; but with the outbreak of the Revolution of 1848 she was once more set adrift. In London she married a guardsman, Stafford Heald, was soon divorced from him and in 1851 sailed for the United States. After touring through this country with a play called 'Lola Montez in Bavaria,' she went to Australia, returned here, was twice married in California and in 1858 lectured in New York where she settled and spent her last days in rescue work among women. Her writings include 'Lectures,' with an autobiography, and 'The Arts of Beauty' (1858).

MONTEZUMA, mōn-tē-zoo'mā (Aztec MONTECUH-ZOMA, the severe or sad one; found written also MONTECUMA, MOCTEZUMA, MUTCZUMA, MOTEZUMA), surnamed ILHUICAMINA (archer of heaven) and called MONTEZUMA I, chief, or emperor, of ancient Mexico: b. about 1390; d. 1464. He succeeded his brother Izcohuatl in the chieftainship in 1436, but was not inaugurated until 1440. His success in war with neighboring tribes was great, and he is said to have extended Mexican conquest to the Gulf. With Netzahualcoyotl, chief of Tezcucō, he built, to prevent inundations from Lake Tezcucō, huge dams, the ruins of which in the San Lorenzo Valley have shown them to have been a marvelous feat of engineering. He also rebuilt Tenochtitlan (on the site of the modern Mexico), the chief Aztec city, substituting for the primitive buildings others of lime and stone; established a severe legal code and developed the ceremonial and influence of the tribal religion. Consult Bancroft, H. H., 'Native Races' (San Francisco 1874-82).

MONTEZUMA, surnamed XOCOYOTZIN and called MONTEZUMA II, chief, or emperor, of ancient Mexico: b. 1479 (authority of Bernal Diaz); d. Tenochtitlan, Mexico, 30 June 1520. He is well known as the ruler of the Aztecs at the time of the Spanish invasion. He succeeded his uncle Ahuizotl as chief in 1503. Almost constant wars were carried on by him with the Tarascans and Tlascalans, and he is said to have led an expedition as far south as Honduras. His internal policy was in many respects wise. He severely enforced the laws, introduced valuable changes in the courts and built many public works, including temples, a new conduit for the water supply and a hospital for invalided warriors. But by his arrogance and pomp, his seclusion, his restriction of appointments to those only of noble rank and his heavy taxation he made himself greatly disliked. His conquests enlarged the empire, but the various parts were without cohesion, and insurrections were frequent. When news was brought in 1518 that ships and white men (of Jean de Grijálva's expedition) had been seen off the coast, Montezuma was greatly alarmed, because an ancient prophecy foretold that Quetzalcoatl, the white god, would at some time come to reign over Mexico. He sent presents to Cortéz, who had landed at Vera Cruz in April 1519, and tried to prevent him from marching to Tenochtitlan. Cortéz, however, arrived there in November and was well received. Fearing an outbreak of the people, who did not agree with the conciliating policy of the monarch, Cortéz then took Montezuma prisoner and retained him as a hostage in the

quarters of the Spaniards. In June 1520, when the Aztecs finally attacked the quarters, Montezuma, at the request of Cortés, attempted by a speech from the wall to end the hostilities. He was wounded by a volley of stones and died a few days later.

Consult Prescott, W. H., *History of the Conquest of Mexico*, new ed., with introduction by S. G. Morley (New York 1948).

MONTEZUMA, city, Georgia, situated in Macon County, at an altitude of 185 feet, on the Flint River, 49 miles southwest of Macon. It is served by the Atlantic Coast Line and the Central of Georgia railroads and has a municipal airport. The city is the trading and shipping center for an area producing peaches, vegetables, and other agricultural products, and it has fruit-packing plants, clothing factories, and lumber mills. Montezuma was incorporated in 1854. Pop. (1950) 2,921.

MONTEZUMA CASTLE NATIONAL MONUMENT, Arizona, situated on Beaver Creek, near the Verde River, about 40 miles south-southwest of Flagstaff. It has an area of 783 acres and contains the ruins of Pueblo Indian cliff dwellings. The best preserved of these, called Montezuma Castle by early travelers in the mistaken belief that it was of Aztec origin, consists of five stories, with walls two feet thick at the base. It contains 20 rooms, most of which extend along the cliffs that support the higher stories.

MONTFAUCON, mōn-fō-kōn', **Bernard de**, French Benedictine monk and scholar: b. Château de Soulage, Aude, Jan. 13, 1655; d. Paris, Dec. 21, 1741. He entered the army in 1672, but three years later joined the Congregation of St. Maur (see MAURISTS) and devoted himself thereafter to classical studies. In 1687 he went to St.-Germain-des-Prés, Paris, and there, except for a three-year stay (1698-1701) in Italy consulting libraries, he remained for the rest of his life. He became a member of the Académie des Inscriptions in 1719.

Montfaucon is considered the founder of scientific paleography. His great work, *Palaeographia Graeca*, published in 1708, is still useful. He also published editions of the writings of the early church fathers, including *Athanasii opera omnia* (3 vols., 1698), *Collectio nova patrum et scriptorum graecorum* (1706), and *Joannis Chrysostomi opera omnia* (13 vols., 1718-1738). In addition, he was the author of *L'antiquité expliquée et représentée en figures* (15 vols., 1719-1724) and *Les monuments de la monarchie française* (5 vols., 1720-1733).

Consult Broglie, C. P. E. de, *La société de l'abbaye de St.-Germain-des-Prés au XI^e siècle: Bernard de Montfaucon et les Bernadins*, 2 vols. (Paris 1891).

MONTFERRAT, mōn-fē-rā' (Ital. MONFERRATO), former marquisate and duchy, Italy, whose territory lay almost entirely in what is now the province of Alessandria, Piedmont. Its capital (after 1435) was Casale Monferrato. The marquisate, which originated in the late 10th century, passed to a branch of the Palaeologi in 1305, and they held it until 1533. Three years later, Emperor Charles V granted it to Federigo II Gonzaga, duke of Mantua. It became a duchy in 1575. In 1631 a considerable part of Montferrat was ceded to Savoy, and in 1708 the re-

mainder also became part of Savoy.

MONTFORT, mönt'fērt (Fr. mōn-fōr') **Simon de**, EARL OF LEICESTER, English statesman and soldier: b. Normandy, 1208?; d. Evesham, Worcestershire, Aug. 4, 1265. He was the son of Simon IV de Montfort l'Amaury, conqueror of the Albigenes (q.v.), and of Alice de Montmorency. His father had been disinherited of his English estates by King John in 1207 and hence had the more readily joined the orthodox French party in fighting the Albigenes, who were led by John's brother-in-law, Raymond VI, count of Toulouse. In 1229, however, the younger Simon was forced to leave France and throw himself on the mercy of the English king, Henry III, who restored to him his lands in Leicester (1231) and married him to his own sister Eleanor, the young widow of William Marshal, 2d earl of Pembroke, secretly and without dowry in 1234. The marriage aroused much antagonism among the nobles, who had not been consulted. Within 18 months, Simon had quarreled with the king over a debt, and he was saved only by taking a crusader's vow, which he fulfilled in 1240. He fought with the king in France in 1242, and in 1248 was made governor of Gascony. There he crushed several rebellions, but his severity occasioned charges of oppression, and although he was acquitted, the king forced his resignation in 1252. In the following year, however, Henry was forced to recall Simon. In 1257, Simon quarreled hotly with William de Valence, the king's half brother and one of his foreign favorites. Simon's boldness in this affair won him the leadership of the barons in the movement for administrative reform. In June 1258, he was one of the 24 commissioners who drew up the Provisions of Oxford, and one of the 15 who signed them in October of that year.

Simon had been the actual head of the reform movement since the conclusion of peace with France (Dec. 4, 1259), which had made reform possible. The cause of the nobles was now submitted to Louis IX of France for arbitration. His decision, made early in 1264, was entirely favorable to Henry, setting aside the Provisions of Oxford and reserving to the people only such rights as they had acquired before the provisions were signed. Meanwhile, in 1263, open warfare had broken out between the king and the barons (the Barons' War). Simon now made an alliance with Llewelyn ab Gruffydd, prince of North Wales. On May 16, 1264, after a brilliantly led engagement at Lewes, Simon succeeded in capturing the king. A constitution was drawn up giving power to a council of nine, over whom were three electors, and in this new regime Simon was practically master of the kingdom.

On Jan. 30, 1265, Simon summoned a parliament of 120 churchmen, 23 barons, 2 knights from each shire, and 2 citizens from each borough. Known as the Model Parliament, it was the forerunner of the modern British Parliament. The session was marked by a quarrel between Simon and Gilbert de Clare, 8th earl of Gloucester, and the latter went over to the Royalist nobles on the Welsh border. After a short reconciliation, Gloucester joined Prince Edward (later Edward I) and fighting broke out again. On June 19, Simon made a treaty with Llewelyn, and set out to meet Gloucester. Reinforcements failing, he was killed in the ensuing battle. His forces were so greatly outnumbered by those

with Gloucester and Prince Edward that at sight of the enemy Simon is said to have exclaimed, "let us commend our souls to God, for our bodies are theirs." To call him the "creator of the House of Commons" is a misapprehension of his work, which forwarded rather than fathered representative government.

Consult Bemont, C., *Simon de Montfort* (Eng. trans. by E. F. Jacob, 1930); Lodge, E. C., *Gascony under English Rule* (1926).

MONTGOLFIER, *môn-gôl-fyâ'*, Anglicized *mônt-gôl'fi-êr*. **Joseph Michel**, French inventor: b. Vidalon-lez-Annonay, 1740; d. Balaruc-les-Bains, June 26, 1810. Together with his brother, **JACQUES ÉTIENNE MONTGOLFIER** (b. Vidalon-lez-Annonay, Jan. 7, 1745; d. Serrières, Aug. 2, 1790), he invented the first practical balloon, consisting of a large linen bag inflated with heated air. On June 5, 1783, it ascended at Annonay, and in a flight lasting 10 minutes it covered a distance of one and one-half miles. Joseph also invented a water-ram which raised water to a height of 60 feet, and Jacques first made vellum paper. See AERONAUTICS.

MONTGOMERY, Bernard Law (1st Viscount MONTGOMERY OF ALAMEIN), British army officer: b. Kennington, London, Nov. 17, 1887. Of Ulster stock, his grandfather was the cleric Dean Frederic William Farrar (q.v.), and his father, Henry Hutchinson Montgomery, was Anglican bishop of Tasmania, where his early years were spent. He, too, might have been a churchman instead of a soldier; it was his daily custom to read a passage from the Bible, a practice he recommended to his officers. After graduating from Sandhurst Military Academy in 1908, he was commissioned a lieutenant of infantry in the Royal Warwickshire Regiment. He served in France and Belgium for three years during the First World War, being twice wounded and six times mentioned in dispatches; he was awarded the Distinguished Service Order and the Croix de Guerre, and for several months before hostilities ended he held the rank of temporary lieutenant colonel. Later, he served as a staff officer on the Rhine, in Ireland, England, and India, and in 1937 he was promoted to brigadier. With the rank of major general, he commanded a division in Palestine and Trans-Jordan during 1938-1939, and on the outbreak of the Second World War he went to France as acting lieutenant general in command of the 3rd Division of the 2nd Corps. Having evacuated his men at Dunkerque during the night of May 31-June 1, 1940, he was given command of the 5th Corps in Britain; and in December 1941, he was entrusted with responsibility for the South-Eastern Command, the most vital post in the defenses against possible German invasion.

On Aug. 18, 1942, he assumed command of the 8th Army ("Army of the Nile"), which had been driven back into Egypt from Libya by German Field Marshal Erwin Rommel, and in North Africa, during ensuing months, he displayed the brilliant leadership which firmly established his reputation as one of the greatest generals in the war. After careful preparation, on October 23, he launched an attack upon the Germans and Italians entrenched at El Alamein, and, when their lines broke, he pursued the enemy remnants into Libya. By early November, Rommel had lost more than half his forces, Montgomery thus being the first of the Allied

generals to inflict a decisive defeat upon a German army. In recognition of his accomplishment, on Nov. 10, 1942 he was knighted by King George VI (Knight Commander of the Order of the Bath) and promoted to full general. Continuing the pursuit with the utmost vigor, he drove the surviving Germans out of Libya into Tunisia, and there his 8th Army co-operated with Gen. Dwight David Eisenhower's forces in bringing the North African campaigns to a victorious conclusion in May 1943.

Still at the head of the 8th Army, Montgomery participated in the Allied landing on Sicily in July 1943, and he led the troops invading the Italian mainland two months later. He continued to serve in Italy until January 1944, when he returned to Britain to take command of all land forces under Eisenhower preparing for the invasion of France. Toughness, common sense, and a profound mutual respect between men and leader made it possible for Montgomery to say to the 8th Army in farewell: "In all the battles we have fought together, we have not had one single failure."

After the successful landing on the Normandy coast on June 6, 1944, Montgomery directed all land operations until August when, with a great increase in American land forces in France, a reorganization of commands became necessary. He was then assigned to command of the 21st Army Group, consisting of the 2d British and the 1st Canadian armies, which held the northern end of the Allied line in the Netherlands and Belgium. Further opportunities to justify his reputation as a skillful and resolute tactician came to him following his promotion on September 1 to the rank of field marshal, highest in the British Army. On Dec. 17, 1944, after a German thrust through the Ardennes had split Lieut. Gen. Omar N. Bradley's 12th Army Group, Montgomery was given temporary command of all Anglo-American troops on the north side of the bulging line, with the American 1st and 9th armies attached to his army group. On May 4, 1945 he accepted the surrender of 500,000 German troops in the Netherlands, northwest Germany, Helgoland, and the Frisian Islands, and on May 22 was appointed chief of British forces occupying Germany and British member of the Allied Control Commission.

Raised to the peerage as Viscount Montgomery of Alamein in 1946, he was made chief of the imperial general staff. When, on Sept. 28, 1948, the Western European Union nations (Britain, France, Belgium, Netherlands, Luxembourg) set up a "Permanent Defense Organization," Lord Montgomery was designated permanent military chairman. He resigned in early 1951 to accept the post of deputy supreme commander of the North Atlantic Treaty forces under Gen. Dwight D. Eisenhower, then supreme commander. He continued to serve in that capacity under Gen. Matthew B. Ridgway.

MONTGOMERY, *môn-gôm-rê'*, **COMTE Gabriel** de, French soldier: b. about 1530; d. Paris, June 26, 1574. A lieutenant of the Scottish guards in the service of the king of France, he accidentally killed King Henry II with whom he was tilting in a tournament in 1559. Montgomery was condemned to retirement in the country, where he read many religious books and was soon led to join the Protestant party. In 1562 he entered Condé's army, serving with bravery and

ability. He saved himself by the swiftness of his horse during the Massacre of St. Bartholomew. In 1574 he led a band of Huguenots and began war in Normandy. There he was captured at Domfront, taken to Paris, tried and beheaded.

MONTGOMERY, James, British poet and journalist: b. Irvine, Ayrshire, Nov. 4, 1771; d. Sheffield, Yorkshire, April 30, 1854. The son of a Moravian divine, he was educated for the ministry at the Fulneck Moravian Seminary near Leeds, but in 1792 he procured an engagement with a bookseller in Sheffield, the proprietor, editor and publisher of the local *Sheffield Register*. Montgomery succeeded him later as editor and publisher of the paper, the name of which he changed to the *Sheffield Iris*. The publication of a liberal journal was at that period fraught with manifold dangers. He was twice prosecuted for trivial offenses and condemned on the first occasion to three and on the second to six months' imprisonment. During his confinement he composed a volume of poems, *Prison Amusements*, published in 1797. In 1806 appeared *The Wanderer of Switzerland*, his first popular effort. It was followed in 1809 by *The West Indies*, a poem exposing the iniquities of the slave trade. Later volumes were *The World Before the Flood* (1812); *Greenland*, a missionary poem (1819); and *The Pelican Island* (1826). In 1825 he resigned the editorship of the *Iris* and passed the remainder of his life in religious and literary work. His hymns, which numbered more than 100, included *Hail to the Lord's Anointed*, and *Prayer Is the Soul's Sincere Desire*. Authorship of his hymns has sometimes been attributed to Robert Montgomery (q.v.).

MONTGOMERY, Richard, American soldier: b. Swords, County Dublin, Ireland, Dec. 2, 1738; d. Quebec, Dec. 31, 1775. At 18 he obtained a commission in the British Army, in 1757 began his career of active service in America, and at the siege of Louisburg in 1758 and elsewhere gave evidence of high military capacity. After a period of residence in England from 1765, in 1772 he sold out his commission and, emigrating to New York, settled in Rhinebeck, Dutchess County. In 1775 he represented Dutchess County in the provincial Congress, and in the same year was appointed one of the eight brigadiers to serve in the newly organized army of the united colonies. He was second in command to Gen. Philip Schuyler in the invasion of Canada, and became commander when Schuyler fell ill. On Nov. 12, 1775 he captured Montreal. He joined forces with Benedict Arnold, and was killed in the assault on Quebec.

MONTGOMERY, Robert, English poet and Anglican clergyman: b. Bath, 1807; d. Brighton, Dec. 3, 1855. His name survives chiefly through the merciless criticism and ridicule of his work by Lord Macaulay in the *Edinburgh Review*. Having taken orders in the Church of England, he officiated at Percy Street Chapel in London till his death in 1855, with an interval of four years as pastor of St. Jude's Episcopal Chapel in Glasgow. His chief works, overpraised by uncritical sentiment for their popular vein, amply justify Macaulay's strictures, though hardly their offensively dogmatic tone. They include *The Omnipresence of the Deity* (1828); *Satan*

(1830), whence his sobriquet of "Satan Montgomery"; and *The Messiah*.

MONTGOMERY, city, Alabama, is the state capital and seat of Montgomery County. It is located on the southern bank of the Alabama River, 410 miles north of the Gulf of Mexico by water and 180 miles by rail, and about 87 miles southeast of Birmingham by air. The city is built on a bluff bordering the river and stretching back to undulating hills. The altitude varies from about 160 to 222 feet. Montgomery lies in the heart of the famous Black Belt, that band of rich, dark soil which stretches almost the entire breadth of the state and embraces about 3,400 square miles. North of this belt are the state's vast coal and iron fields, and south of it are great forests of yellow pine. Six railroads serve Montgomery: the Louisville and Nashville; the Gulf Mobile and Ohio; the Atlantic Coast Line; the Central of Georgia; the Seaboard Air Line; and the Western Railway of Alabama. Several federal and state roads converge on the city. Montgomery has its municipally owned airport Dannelly Field, with scheduled airline service; and a commercial field, Allensport Air Field, for private aircraft and charter flights. Just outside the city are Maxwell and Gunter Air Force bases. At Maxwell Air Force Base is the Air University, the top level training command of the United States Air Force.

Commerce and Industry.—Montgomery is the main market of the central Alabama area, and one of the chief distributing points of the South. It is the largest cattle market south of the Ohio River and east of Fort Worth. Montgomery County itself is one of the heaviest populated counties in the United States in livestock. The city also ranks high as a cotton market and distributing point. Montgomery's location in the state gives it natural advantages for processing and manufacture. From its food processing plants come canned goods, soft drinks, sirup, pickles, meat, cottonseed oil, and other products. Among the city's numerous lumber companies are about a score that specialize in various types of woodwork. Montgomery is the manufacturing center of the United States for Victorian furniture reproductions, accounting for about 40 per cent of the total volume and about 75 per cent of the hand-carved variety. Chief among other manufactures are fertilizers, insecticides, textiles, clothing, glass, chemicals, and plumbing and heating supplies.

Buildings and Cultural Institutions.—The State Capitol, constructed of stucco-covered brick and designed in Greek Revival style, dates from 1851, when the central, white-domed portion was erected. Since then, wings have had to be added, but the building is still noted for the beauty of its design. It stands on a landscaped hill of lawn, trees, shrubbery, and gardens. In the rose garden, some variety of this flower blooms every month of the year in this city which is noted for its beautiful old gardens. On the capitol grounds are also a number of fine sculptural pieces, including the Confederate Monument, executed by Alexander Doyle but designed by Gorda Chipman Doud, one of Montgomery's own artists. Jefferson Davis laid the monument's cornerstone in 1886, and a statue of him by Frank Hibbard is on the capitol's front lawn. Gutzon Borglum's statue of John Allan Wyeth, son of Alabama and a world-famous surgeon and medical edu-

ator, is also on the grounds. Within the building are paintings and sculpture, such as the murals and bas relief panels by Roderick D. Mackenzie, and the bronze bust by Percy Bryant Baker of another of the state's famous sons—Gen. William C. Gorgas. The World War Memorial Building (1940) houses the state's Department of Archives and History with its library and historical museum, the latter including exhibits of the years when Alabama was part of the French colony of Louisiana. The city-owned Museum of Fine Arts, which also promotes interest in Southern history, contains period rooms, family heirlooms, and some rare collections of historic importance, including firearms and silverware. A frame structure, built in the early 1850's and now known as the First White House of the Confederacy, is a memento to Jefferson Davis, who lived in it when Montgomery was the capital of the Confederacy. The house is filled with his personal belongings and with relics of Civil War days. Several of the city's other beautiful buildings are even older, such as Pickett House (1830's) and the Seibels and Lomax houses (1840's). Church organizations of all denominations are represented in the city, several of which have handsome, modern edifices. St. John's Episcopal Church (1836) is of particular historic interest. Here, as president of the Confederacy, Jefferson Davis worshiped; and Montgomery women made it their headquarters for war work, until the church was temporarily closed by Federal troops following the bishop's advice to pray for the president of the Confederacy instead of the president of the United States.

Education.—Montgomery's public education includes elementary and secondary schools for white and for Negro children. The state's University of Alabama has a branch in Montgomery in which students can complete the first two years of college work. In 1951 this university center had an enrollment of more than 1,000 students. The Alabama State College for Negroes is also located in the city. In 1951 it had more than 4,000 enrolled students. Huntingdon College (Methodist, for women) is an accredited college of arts and science. There are reference libraries connected with all the educational institutions in the city, as well as a public library with a collection totalling 38,000 volumes.

Government and History.—Montgomery has a commission form of government, headed by a mayor and two commissioners. It was incorporated as a town in 1819, and as a city in 1837.

Near the site of Montgomery, before white settlement began, was the Alibamu village of Kanchati. A few white squatters settled there in 1814. When the lands in the Territory of Alabama were opened for sale in 1817, two closely adjoining settlements—Alabama and East Alabama—were made. In 1819, these rival communities merged under the name of Montgomery, honoring the Revolutionary War hero, Gen. Richard Montgomery. (The county had already been named for Maj. Lemuel P. Montgomery, who died during the decisive battle with the Creek Indians at Horseshoe Bend in the Tallapoosa River in 1814.) In 1821, Montgomery had stagecoach transportation to Tennessee and Georgia for passengers and mail, and steamboat connection with Mobile for the transportation of people and produce. It was already becoming a cotton market and distributing point for an in-

creasing number of planters, and stores accepted either cash or cotton in exchange for purchases. In the 1820's, Montgomery's first newspapers were established, the *Advertiser* (1828), which exists to this day, soon becoming one of the most influential in the state. With the opening of a state bank and the beginning of construction of a railroad from Montgomery into western Georgia in the 1830's, population and business increased. In 1840, Montgomery's residents numbered 2,179. In 1846, the city was designated as the state capital, and by 1850 population reached 8,728.

By interest and by location, Montgomery was the focus of the secession movement. On Feb. 4, 1861, Alabama representatives met in the city with those from the five other states in the lower South which had decided to secede. With Jefferson Davis as chairman, they drafted the Confederacy's constitution, constituted themselves a provisional legislature, and set up the Confederate government with Montgomery as its first capital. In July the Confederacy's capital was moved to Richmond. On April 12, 1865, Maj. Gen. James Harrison Wilson took the city and destroyed whatever was of military value. He and his staff made the Teague House (which still stands) their headquarters, and the general read the Emancipation Proclamation from its porch. The years of reconstruction were difficult ones, but the city had so far recovered by 1885 that it replaced its horse-drawn transit with an electric trolley car system, said to be one of the first in the world. In 1890, the city's residents numbered 21,883. About 1900, Montgomery's possibilities as a manufacturing city were recognized and, from then on except during the years of national depression, progress was steady.

Population.—Population growth from 1900 is shown in the following figures: (1900) 31,346; (1910) 38,136; (1920) 43,464; (1930) 66,079; (1940) 78,084; (1950) 106,525. In 1940, the Negro population of the city was 39 per cent; in 1950, it was about 30 per cent.

PAUL B. FULLER,
General Manager, Montgomery Chamber of Commerce.

MONTH, a period of time derived from the motion of the moon. The sidereal month may be regarded as the period in which the moon, as seen from a fixed star, would appear to make a complete revolution round the earth; it is evidently the period in which she passes through the 12 signs of the zodiac; its mean value during the year is 27.32166 days. The synodical month, more commonly called a lunar month or lunation, is the period during which the moon goes through all her phases. It is usually reckoned from new moon to new moon; to complete the lunation the moon must not only pass through the 12 signs of the zodiac, but also come again to occupy her old position relatively to the sun, which has itself advanced in the zodiac, hence the lunar is longer than the sidereal month. The mean value of the lunation is 29.53059 days. The solar month is the 12th part of one solar year, or, 30.4368 days. The anomalistic month is the period in which the moon passes from perigee to perigee of her orbit; it differs from the sidereal month because the perigee varies its position. The line of nodes of the moon's orbit varies its position, and the nodal month, or the period of her motion from ascending to ascending node, differs from the

other months mentioned above. The 12 civil or calendar months of the year have from 28 to 31 days each. The lunar month was used by the Chaldeans and Egyptians, and is still by the Jews, Turks, and some uncivilized nations. The calendar months are not equal divisions of the year, some (April, June, September and November) consisting of 30, and the remainder of 31 days, except February, to which a period of only 28 days is assigned (see **LEAP YEAR**), with the addition every fourth year of one more day. In popular language a month is often understood to be four weeks, as this is very nearly an equal period, expressed in the division by weeks, to the month. See also **CALENDAR**; **MOON**; **ZODIAC**.

MONTHOLON, mōn-tō-lōn', **COMTE Charles Tristan de** (later **MARQUIS**), French soldier: b. Paris, July 21, 1783; d. Aug. 21, 1853. After service in the navy, he entered the army in 1798, took part in the Napoleonic campaigns in Italy, Austria and Prussia, distinguished himself at Wagram (July 5-6, 1809), was made chamberlain (1809), was sent on an important diplomatic mission to the Archduke Ferdinand of Austria (1811) and became general of brigade (1814). During the Hundred Days he was adjutant general to Napoleon, whom he accompanied in his exile to St. Helena, and by whom he was appointed one of his executors. Proclaimed chief of staff by Prince Louis Napoleon (later Emperor Napoleon III [q.v.]) when the latter landed at Bologne in 1840, he was condemned by the Peers to 20 years' imprisonment, but was liberated after the February revolution (1848). He was elected to the Legislative Assembly in 1849. He published *Mémoires pour servir à l'histoire de France sous Napoléon, Ecrits à Sainte Hélène sous sa Dictée* (with G. Gourgaud 1822-1823), and *Récits de la Captivité de Napoléon* (1846).

MONTH'S MIND, the requiem Mass celebrated in the Roman Catholic churches for the deceased the 30th day after death. The prayers of the Mass are the same as those of the requiem Mass celebrated on the day of decease or burial except the Collect, Secret and Post-Communion. In the early English church the prayers were offered daily for a month after the person's death. The anniversary of the death is commemorated similarly by the Mass called the **YEAR'S MIND**.

MONTI, mōn'tē, **Vincenzo**, Italian poet: b. Fusignano, near Ravenna, Feb. 19, 1754; d. Milan, Oct. 13, 1828. He was educated in law against his inclination; became secretary to Prince Luigi Braschi; won his literary spur with *Saggio di Poesie* in 1779; gained speedy popularity with various occasional odes; and in 1784 and 1787 brought out his two great tragedies, *Aristodemo* and *Galeotto Manfredi*, both in the style of Alfieri. His *Bassavilliana* (1793), a Dantesque poetic chronicle of recent happenings, notably the massacre of the French envoy Basville by the Roman populace, showed ability to treat a theme in politics; but from the detestation expressed in that poem for the excesses of the Revolution and his appeal to the Austrians against the French, he soon came to the most ardent praise of Napoleon and fled to France to escape punishment from Austria. His panegyric of the mathematician Lorenzo Mascheroni (1801) is largely an attack by the poet

upon his personal enemies. (See **MASCHERONIANA**). After Marengo he returned to Italy and became professor of oratory at Pavia, imperial poet laureate in Milan, and, after the coronation of Napoleon, historiographer of the Italian kingdom. From that time until the restoration of Austrian rule in Italy, Monti was devoted to Napoleon and wrote numerous odes of victory in his honor. In his latter years, a period of study and adversity, he joined his son-in-law, Giulio Perticari, in his fight with the Della Cruscani, and published his single great work, a version of the *Iliad* (1810). His translation of Persius should be mentioned and his most successful drama, *Caio Gracco* (1802). Monti was an ardent classicist and in his *Sermone sopra la mitologia* (1825) combated romantic tendencies.

MONTICELLI, mōn-tē-sē-lē', **Adolphe Joseph Thomas**, French painter: b. Marseille, 1824; d. there, 1886. He made a short stay in Paris and contributed to the Salon; but, not meeting with success, returned to his native town, where he died poor, ignored and insane. Unappreciated, he sold his pictures in cafes for 10 or 20 francs; today they bring large sums. Collectors have made fortunes out of the small canvases which have given Monticelli posthumous fame. His *Court of the Princess* is in the Metropolitan Museum, New York. To use the words of the artist himself, "in the canvases the objects are the decoration, the touches are the scales and the light is the tenor." Monticelli created for himself an entirely personal technique, which can only be compared with that of Joseph Turner. He painted with a brush so full, fat and rich that some of the details are often modeled in relief in a substance as precious as enamels, jewels, ceramics—a substance which is a delight in itself. Constructed upon one color, as upon a musical theme, a picture by Monticelli rises to an intensity which one would have thought impossible.

MONTICELLO, mōn-tī-sēl'ō, city, Arkansas, Drew County seat; altitude 272 feet; on the Missouri Pacific Railroad; 80 miles southeast of Little Rock; has an airport. Here are lumber mills, cotton and cottonseed oil mills, bottling works and canning plants. In the tomato season Monticello packs and ships tomatoes in carload lots. Monticello has good schools, and is the seat of Arkansas Agricultural and Mechanical College. Near by is a Soil Conservation Demonstration Area. The town has a mayor and council, and owns its water supply system. Pop. (1930) 3,076; (1940) 3,650; (1950) 4,501.

MONTICELLO, city, Indiana, White County seat, altitude 675 feet, on the Tippecanoe River; on the Pennsylvania and the Chicago, Indianapolis and Louisville railroads, 21 miles west of Logansport, 98 miles southeast of Chicago. With agricultural environment, the city has industrial establishments that employ approximately 1,200 workers, making television cabinets, and insulating wire. Much water power is furnished by the river. Mayor and council administer the government. The city owns its water supply system. Pop. (1940) 3,153; (1950) 3,467.

MONTICELLO, village, New York, Sullivan County seat; alt. 1,524 feet; on New York, Ontario and Western Railroad; 34 miles northwest

of Middletown. Located in a characteristic New York farming section where potatoes and apples, corn and wheat are grown, it has small local industries and is a mountain resort with both summer and winter recreations.

Monticello was founded by John P. Jones in 1804, and was named after Thomas Jefferson's estate in Virginia (see MONTICELLO). It has government by mayor and council. The water supply system is owned by the village. Pop. (1950) 4,223.

MONTICELLO, mōn-tē-chēl'lo (It. Little Mountain), Virginia, the estate and residence once owned by Thomas Jefferson (q.v.), third president of the United States. It is in Albemarle County, Va., about two miles from Charlottesville. The estate was an unbroken forest in the early part of the 18th century, until in 1755 the land came into possession of the father of Thomas. Peter Jefferson, the father, and his brother-in-law decided to "go West" and try a new country, so they left the tide-water settlements on the James River and journeyed about 100 miles toward the west, to what is now Albemarle County, and located 20 miles east of the Blue Ridge and among the foothills of the South-east Mountains. Peter Jefferson "patented" a tract of land of about 1,000 acres. In looking over his new possession he found no site for a home, such as pleased him; his neighbor, Randolph, sold him from his tract 400 acres for Henry Weatherbourne's biggest bowl of arrack "and." The place was then called Shadwell, after Shadwell Street in London, and the country around Goochland. Thomas Jefferson was born at the old residence at Shadwell, and this house was his home for 27 years. From his boyhood his favorite spot on the estate was Little Mountain. Often he and his most intimate friend, Dabney Carr, afterward his brother-in-law, ascended the mountain in the twilight, and in the long vacations they studied many an hour under an oak tree, their favorite of the forest. They agreed that whichever one died first, the other would have him buried under this tree, and at an early age Dabney Carr was here laid to rest. Later Jefferson, his wife, two daughters, and others of his descendants were buried in the little cemetery which was formed around this ancient oak.

It was when Jefferson was a member of the House of Burgesses of Virginia, to which he was elected in 1769, that he began the erection of his residence on the summit of the world-renowned eminence, Monticello. (Jefferson changed the English name to the Italian, Monticello). The Shadwell mansion was on a hill on the north bank of the Rivanna River, and Monticello is south, just where the stream cuts its channel through the outlying range of the Alleghenies, the Southwest Mountains. On the northeast Monticello has a steep rocky base, washed by the Rivanna, on the southwest is a dip of about one-third the height of the mountain which connects it with Carter's, a higher peak. Monticello is still covered by a dense growth of timber, mainly hardwood deciduous trees.

Before the residence on Monticello was completed, the Shadwell mansion was burned down, Feb. 1, 1770. The first building on Monticello was a brick story-and-a-half structure containing one good-sized room and some smaller rooms; it still stands as the south pavilion.

Here Jefferson brought his bride in 1772. He was often absent from this beloved home, but his own manuscripts, especially his garden-book, show his love for a quiet domestic life. This same garden-book shows that in 1769 he planted a variety of fruit trees on the southeast slope of the mountain, many of them still in existence. The house was enlarged to suit the needs of the family, and in accordance with the owner's plans. From his European journeys he brought back many new ideas, so that the architecture of the house is somewhat complex. It has the appearance of an Italian villa, with a Greek portico, and considerable of the features of Colonial architecture. The Marquis de Chastellux in a book of travels mentions a visit to Monticello in 1782, and says of Jefferson: "He is the first American who has consulted the fine arts to know how to shelter himself from the weather." Architecture in America has advanced since that time. Some of the plans, drawn by Jefferson himself, are still in existence. The part of the home that was to last was made of good material and possessed a certain elegance, but the furniture was most simple.

His last days saw the estate of Monticello so deeply in debt that it was feared he would have to end his life an exile from his beloved mountain. He sacrificed some of his estate hoping to save the residence and some land for his daughter. His friends assisted him so the estate was not lost to the Jefferson heirs until after his death; it had been his home for 56 years. No debt was allowed to defame the name of Jefferson; Thomas Jefferson Randolph, the grandson, and his daughters paid every dollar of debt their eminent ancestor owed after Monticello had been sold. The great granddaughters kept a school to assist their father in paying this debt. Ten years after Jefferson's death, Monticello was purchased by Uriah P. Levy, USN, who bequeathed it to the nation. His will was contested and the late Jefferson M. Levy, New York congressman, bought off the other heirs, and restored the building and estate to their original condition. In 1923, the Thomas Jefferson Memorial Foundation was incorporated in New York for the purpose of purchasing Monticello and maintaining it as a national shrine. A formal contract was entered into with Mr. Levy for the purchase of the property at a price of \$500,000, and legal title to it, including 640 acres of land and numerous Jefferson relics, was taken on Dec. 1, 1923. Although the entire purchase price had not then been paid, Monticello was dedicated as a national shrine, July 4, 1926, with an impressive ceremony.

MONTIGNIES-SUR-SAMBRE, mōn-tē-nyē'sūr-sān'br', commune, Belgium, in the Province Hainaut, located on the Sambre, 30 miles south of Brussels and on the Lodelinsart-Givet Railway. It is the center of a coal mining industry and has manufactures of ovens, machinery, and steel ware. Pop. (1948) 23,145.

MONTIJO, mōn-tē'hō, Eugénie Marie de. See EUGÉNIE, empress of the French.

MONTJOYE SAINT DENIS, mōnt-joi'sān dēn-ē, a French war cry dating from the 12th century. The name is derived from the hill near Paris on which St. Denis suffered martyrdom.

MONTLOSIER, môn-lô-zyä' **COUNT DE** (FRANÇOIS DOMINIQUE DE REYNAUD), French publicist and politician: b. Clermont, Auvergne, April 11, 1755; d. there, Dec. 9, 1838. He was elected a member of the States-General (1789) and favored protection of royalty and nobility. He fled (1791) to London where he started an anti-revolutionary paper, the *Courrier de Londres*. In 1800 he was won over by Bonaparte and given a position in the Ministry of Foreign Affairs. He frequently accompanied Napoleon I as political correspondent during his campaigns, but resigned in 1812. After the first Restoration his *Histoire de la monarchie française depuis son établissement jusqu'à nos jours* (Paris 1814) was a work in praise of the feudal state. Under the Restoration he took a prominent place fighting the activities of the Jesuits and published his *Mémoire à consulter* (1826), but in his *De la crise présente et de celle qui se prépare* (1829) he tries to intermediate between the parties, returning to his early aristocratic views in his *Mémoires sur la Révolution française, le Consulat, l'Empire et la Restauration* (1829). He defended the Louis Philippe government and was created a peer.

MONTLUCON, môn-lü-sôn', France, town in the Department of Allier, located on the Cher, starting point of the Berry Canal and junction of the Orleans Railway. It consists of the old town with its 15th century castle, and the modern industrial section which has been built up since the opening up of the coal field of Commentry. It possesses a lyceum, commercial court, chambers of agriculture and manufactures, a library and theater. Its industries are important and consist chiefly of iron and steel works, glass and mirror factories, chemical products, machinery and considerable trade. It has a population of (1946) 47,074.

MONTMAGNY, môn-mä-nyé', **Charles Jacques Huault**, French colonial governor: b. France, c.1600; d. Saint Christopher, W. I., after 1654. The second governor general of Canada, 1636-1648, he was an able administrator, and made peace with the Iroquois in 1645.

MONTMAGNY, môn-mä-nyé', Canada, town and county seat of Montmagny County, Quebec, on the south shore of the St. Lawrence River, 34 miles east by north of Quebec, and on the Canadian National Railway. It has stove and boiler works, agricultural implement works, pulp mill, furniture factory, silk, casket, lumber and electrical appliance establishments. Montmagny has several good schools and was incorporated as a town in 1885. Pop. (1941) 4,585.

MONTMARTRE, môn-mär'tr, France, a northern district of Paris, a former suburban village, on a conical hill commanding an extensive view of the metropolis. See PARIS.

MONTMEDY, môn-mä-dé', France, town in the Department of Meuse, near the Belgian frontier about 25 miles north of Verdun. It consists of a citadel on a rock 960 feet above sea level with its old or upper town built in 1235, and the lower town (Médy-Bas). In 1659 it came under French rule. Louis XIV had the fortifications greatly strengthened. In 1815 the Prussian and North German allies besieged and then took the lower town by storm when it

capitulated. In 1870 the Germans used it as a rail center. Twice again it was captured by the Germans, in World Wars I and II. Pop. (1946) 2,491.

MONTMORENCY, môn-mô-rän-sē', **Duc Anne de**, French soldier: b. Chantilly, March 15, 1493; d. Paris, Nov. 11, 1567. He was a distinguished general in the wars of Francis I, and was taken prisoner at Pavia (1525). In 1537 he was made constable of France, but by a rapid change of fortune was banished from the court in 1541 under suspicion of conspiracy. He was restored by Henry II (1547), in 1557 was defeated by the Spaniards and taken prisoner at Saint-Quentin, and in 1562 was again captured while commanding against the Huguenots at Dreux. In 1563 he drove the English from Le Havre, and in 1567 received a fatal wound in the battle against Condé (Louis I de Bourbon) at Saint-Denis.

Consult the life by Decrue (1885-1889)

MONTMORENCY, **Duc Henri II de**, French soldier: b. Chantilly, April 30, 1595; d. Toulouse, Oct. 30, 1632. In 1612 he purchased the vicereignty of Canada from the prince of Condé for 11,000 crowns, and was wise enough to retain Samuel de Champlain in command at Quebec. He wearied, however, of the post which gave him constant trouble, and in turn sold it. His services against the Huguenots in the civil wars were distinguished, and included a victory over the duc de Rohan in 1628; but he took part in the insurrection of Gaston of Orleans in 1629, was made prisoner, condemned for treason, and beheaded.

MONTMORENCY FALLS, Canada, a beautiful cascade near the mouth of the Montmorency River, on the St. Lawrence River, six miles below Quebec. The river has an irregular course north and south of about 15 miles, and just above its confluence with the St. Lawrence falls over a precipice 265 feet high, and 100 feet wide at its crest. The falls are visited by great numbers of tourists, and are utilized to supply the power necessary for the electric and street railway plants of Quebec.

MONTOJO Y PASARON, môn-tô'hô i pä-sä-rôn', **Patricio**, Spanish naval officer: b. El Ferrol, La Coruña, Sept. 7, 1839; d. Madrid, Sept. 30, 1917. Entering the navy in his youth, he served with distinction and was awarded the Grand Cross of Maria Cristina in 1897. Commanding the Spanish fleet in the Pacific at the outbreak of the Spanish-American War, his ships in Manila Bay were attacked by Commodore Dewey's American Pacific squadron on May 1, 1898. Montojo's flagship the *Reina Cristina*, successively engaged by the *Olympia*, *Baltimore*, *Raleigh*, and *Boston*, was struck by 70 shells that killed 52 and wounded 150 of the crew. After it caught fire Montojo transferred his flag to a gunboat. Court-martialed in Madrid in September 1899, he argued that the government, not he, was at fault for failing to provide proper equipment.

MONTORO, môn-tô'rô, Spain, town in the province of Córdoba on the rocky left bank of the Guadalquivir and on the Madrid-Sevilla Railway. It has a beautiful church and a fine bridge built in the 16th century and remains of

the ancient Moorish fortifications. Its chief industry is olive oil production, sawmilling, and cultivation of tropical fruits. Pop. (1940) 9,541.

MONTORSOLI, Fra Giovanni Angelico la. frä jō-vān'ñē ān-jēl'ē-kō dā mōn-tōr'sō-lē, Florentine sculptor and architect: b. Montorsoli, 1507; d. Florence, Aug. 31, 1563. He was a member of the religious order known as Servites; worked at Genoa, after retiring from that order, and by building the Serra and Doria palaces and adding a chantry and Doria tomb to the church of San Mateo, established his reputation as a sculptor and architect (1525). He was soon afterward engaged as assistant by Michelangelo in his work on the chapel of the Medici at Florence; the statue of Saint Cosmas here is by him. Among his other productions are the fountain in the cathedral square at Messina (1547); he also designed several chapels in the cathedral there and built the light-house.

MONTOUR, mōn-tōōr', Esther (called Queen Esther), American half-breed Indian of the 18th century. She had French blood in her veins and was supposed to have been a descendant of Louis de Buade, Count de Frontenac, governor of New France. She married Eghonmud, chief of the village of Sheshequin, and her own intelligence enabled her to completely dominate the Senecas over whom she reigned as "Queen Esther." She was friendly to a Mohican mission which was located near her village for some years, and accompanied the delegates to various congresses of the Six Nations in Philadelphia, where she was well received because of her pleasing manners and beautiful person. In the Wyoming massacre in July 1778 she was the savage in her nature, asserted itself, however, and to avenge the death of her son she massacred 14 prisoners.

MONTPELIER, mōnt-pēl'yēr, city, Vermont, capital of the state, and Washington County seat, altitude 523 feet. Located 37 miles southwest of Burlington, on the Winooski River, it is served by the Central Vermont, and the Barre Chelsea railroads. Airline service is furnished through a municipal airport, three miles distant.

The city is on the main pass through the Green Mountains. Its three principal streets follow the Winooski and its tributary, the North Branch, which was earlier known as the "Onion River" or the "French River" because of its use by the French and Indians.

Barre's world famous granite quarries are 10 miles distant. Industrial products include granite memorials; sawmill and granite-working machinery, wood and plastic products, concrete pipe; maple sirup and maple sugar.

The city is a center of the insurance business with the home offices of three fire insurance companies, a casualty company, and the National Life Insurance Company founded in 1850. These and the various departments of the state government furnish the bulk of employment. There are several libraries, a state law library, state historical library, state traveling library, and the city public library. The Wood Art Gallery, established in 1899, has a permanent collection of paintings by Thomas Waterman Wood and some other artists and puts on a variety of exhibitions

annually. The city is the site of Vermont Junior College, coeducational, and of the recently enlarged Heaton Hospital. A flood control dam, first in the country built by CCC, is a nearby feature. The city has an excellent recreation field and swimming pool. The first State House, dating from 1809 to 1836, was a wooden structure; the second, built of Barre granite, was gutted by fire in 1857; the third and present edifice is of Vermont granite with a golden dome and a colonnaded portico. It is topped with a heroic statue of Ceres, the work of Larkin Mead of Brattleboro. The Supreme Court building, the county courthouse, the city hall, and some of the insurance office buildings are notable. One of the interesting historic buildings is the Dewey House in which Admiral George Dewey was born.

The city's history begins with 1787 when land for a settlement was granted to Colonel Timothy Bigelow of Worcester, Massachusetts. Colonel Jacob Davis, a Revolutionary War veteran, named the settlement after the French city of Montpellier. It became the capital of the state in 1805, and in the same year it was chartered as a city. The municipal government is of the mayor-council-city manager type. The water supply system is owned and operated by the city. Pop. (1950) 8,599.

MONTPELLIER, mōn-pē-lyā', city, France, capital of the Department of Hérault, is located on the Lez River, 6 miles north of the Mediterranean Sea, and 77 miles northwest of Marseille. It is a manufacturing city, and also a tourist, winter, and health resort. Its manufactures include cottons, candles, soap, verdigris, chemicals, candies, perfumes, and hosiery. It has an active trade in wines and alcohol. Among its noteworthy features are the Peyrou, a promenade on which is the Château d'Eau at the termination of a lofty double-arched aqueduct; the citadel; the cathedral; the Palais de Justice; the university buildings; and Porte de Peyrou, a triumphal arch of the Doric order. Its school of medicine has been famous since the 12th century and is now merged in the celebrated University of Montpellier, founded in 1289. The botanical garden, begun under Henri IV in 1593, is the oldest in France. Montpellier dates from the 8th century. It was a Huguenot stronghold in the 16th century and suffered much in the religious wars. The Edict of Montpellier (Oct. 20, 1622) granted the free exercise of their religion to Protestants and confirmed the Edict of Nantes. The philosopher, Auguste Comte, was born here in 1798. Pop. (1946) 80,673.

MONTPENSIER, DUCHESSE DE (ANNE MARIE LOUISE D'ORLEANS, ān mā-rē' lwēz' dōr-lā-ān' mōn-pān-syā'), French princess, better known as **MADAMOISELLE** or **LA GRANDE MADAMOISELLE**: b. Paris, May 29, 1627; d. there, April 5, 1693. Her father was Gaston d'Orleans, brother of Louis XIII. Her mother, Marie de Bourbon-Montpensier, died when her daughter was five days old, leaving her the wealthiest princess in Europe. Rich, proud, and romantic, she aspired to a high match, but in 1646 refused the prince of Wales, later Charles II. Her chance to marry Louis XIV was ruined in 1652, when she sided with the prince de Condé in the revolt of the Fronde, and for his protection had the canon at the Bastille fired on the royal

troops. Upon her return to the court in 1657 she fell in love with the future duc de Lauzun (q.v.), whom Louis refused to let her marry. Lauzun was imprisoned for 10 years, but Made-moiselle seems to have married him secretly, in spite of the king, only to find him a brutal husband; they were separated and her last years were spent in pious devotion. Her *Memoirs*, covering the years 1630-1688, are particularly valuable for the light they throw upon the history of the Fronde; they are edited by Chéruel (1858).

Consult Barine, *La Jeunesse de la Grande Mademoiselle 1627-1652* (New York 1901); Price, E. C., *A Princess of the Old World* (New York 1907).

MONTPENSIER, DUC DE (ANTOINE MARIE PHILIPPE LOUIS D'ORLÉANS), French prince and claimant to the Spanish throne: b. Neuilly, July 31, 1824; d. Sanlúcar de Barrameda, Spain, Feb. 4, 1890. The fifth son of King Louis Philippe, he studied at the Collège Henri IV, entered the army in 1842, served in Algiers, and in 1846 married the Spanish infanta Maria Luisa Fernanda. After the revolution of 1848 he lived in England and Holland; then settled in Spain, where he received the title of infante and was made captain general of the Spanish Army. He was suspected of a plot against the crown and was exiled from Spain, returning only after the revolution of 1868. In 1870 he quarreled with Henry, duke of Seville, also a claimant for the throne, and killed him in a duel. During the reign of King Amadeus (1871-1873), Montpensier was exiled to the Balearic Islands; upon his recall in 1873 he sided with Alfonso XII, and married to that prince his daughter, Maria de las Mercedes, who died without issue in 1878, the close of Montpensier's political activity. His eldest daughter, Isabelle, married Philippe d'Orléans, comte de Paris, and his son Antoine became the husband of the Infanta Eulalia in 1886.

MONTREAL, mŏn-trê-ôl' (French spelling MONTRÉAL, mŏn-râ-âl'), city and island, Quebec, Canada. The city is situated on Montreal Island between the St. Lawrence River and the Rivière des Prairies, at latitude 45° 30' 21" N and longitude 73° 34' 30" W. The largest city in Canada, it is the second largest French-speaking city in the world, and the largest inland seaport on the globe. First peopled by French settlers, then by English immigrants, it has grown from turbulent days under two widely different regimes into a worldly, bilingual city with unusual opportunities for cultural and economic development. It is old France and New World, churches and factories, "habitant" Bonsecours Market and International Civil Aviation Association, congested traffic and quiet mountain paths, more French than English, yet sounding more English than French (at least to casual visitors), a vital city of contrasts, a mosaic of Canadian life.

Climate.—Montreal has a cold winter with an abundant snowfall, a warm and pleasant summer, a long, delayed spring, and a gorgeous, lingering autumn. Climate variations can be sudden and disconcerting. Rigorous polar storms may be followed by almost tropical heat waves, with, or without, the expected gradations. Over a period ranging from 37 to 93 years, extreme temperatures such as 29°F. below zero and 59°F. above in December, and 46° to 96°F. above zero in July, have been registered in Montreal. But, generally,

cold and heat attain their maximum intensity in the proper seasons, and then only for a few days. The average snowfall is 100 inches; rainfall, 3½ inches.

Topography.—Montreal Island is situated in the middle of a plain that extends from the Laurentians to the Adirondacks and from the Atlantic to the Great Lakes. It lies in the confluence of the St. Lawrence and Ottawa rivers, at the foot of inland navigation which starts 1,200 miles away to the west, and at the head of ocean navigation which travels 1,000 miles to the sea over one of the world's greatest commercial waterways. The Island of Montreal is part of the Hochelaga group of islands, which comprises Île Jésus, next largest, separated from Montreal by the Rivière des Prairies, and a number of smaller islands, notably St. Helen's, Heron's, and Devil's. Almost triangular in shape, Montreal Island is 32 miles long and 10 wide in the broadest part and has an area of 200 square miles. At its center stands Mount Royal ("the Mountain," 769 feet), of volcanic origin. The city stretches from its lower terraces to the water front.

When the glacial sea of 20,000 years ago receded, beaches and terraces were left on the slopes of the Mountain. (Sea shells are still found on the highest of these, at 568 feet.) The main streets of the city, Sherbrooke, St. Catherine, Dorchester, and St. James, follow the level course of those former beaches, while the cross streets, such as Guy, Beaver Hall Hill, Bleury and St. Denis, ascend from one to another. Thus the city is divided into more or less regular rectangles. Originally laid out by Dollier de Casson, Notre Dame was the first street of what was then called Ville-Marie de Montréal, though St. Paul's existed before as a path to the woods. Today, both Notre Dame and Sherbrooke streets extend 18 miles across the city, leading from Montreal West to the eastern extremity of the island. St. Lawrence Boulevard runs across the island, from the water front to the Rivière des Prairies, dividing the city into east and west sections, and arbitrarily into French and English ones. There are, in all, 1,000 miles of streets.

Industrial activity stretches for miles along the Lachine Canal and the harbor front, wholesale and finance districts are just beyond, in Lower town; retail trade in Uptown, along with the large hotels and theaters; residential areas spread from there in all directions, slowly invading the Mountain. The city proper covers 55 square miles; Greater Montreal, 95. It is connected with the mainland by 13 bridges, of which the three largest are Jacques Cartier, Mercier and Victoria bridges.

Points of Interest.—Churches.—Montreal has a great number of churches and religious institutions. In the city proper there are more than 375 temples, over 200 of them of the Roman Catholic faith. Other denominations include Anglican, United, Presbyterian, Baptist, Greek Orthodox, German Lutheran, and Jewish. The church of Notre-Dame, in Place d'Armes, is successor to the first birch-bark chapel constructed by the early settlers in the fort of Ville-Marie. Actually the Sulpician Order erected two churches (1672 and 1757) on the site before beginning the present one in 1824. Of cut limestone, in Gothic style, it is one of the largest and most impressive churches in North America, and contains stained glass windows illustrating the early history of Montreal. Its twin towers are

quaintly named Tower of Temperance and Tower of Perseverance. The carillon includes "Le Gros Bourdon," one of the biggest bells of the continent, weighing 12.39 tons. The architect of the building was James O'Donnell, a New Yorker, who lies buried in the crypt. Other Roman Catholic churches of importance include St. James Cathedral, seat of the archdiocese, a smaller replica of St. Peter's Basilica in Rome; St. Joseph's Shrine, 500 feet up the mountainside, drawing millions of pilgrims who come to ask the intercession of the revered Brother André (d. 1937), a lay brother of the Order of the Holy Cross, who founded the oratory in 1904; Notre-Dame-de-Bonsecours, the sailors' church, on the waterfront; Notre-Dame-de-Lourdes, the Gesù, Saint-Jacques-le-Mineur, and St. Patrick's. Protestant churches number more than 130, chief of which is Christ Church Cathedral, seat of the Anglican bishop. Another Anglican church of note is St. George's on Dominion Square. Center of the Presbyterian faith is the Church of St. Andrew and St. Paul, while the United denomination is primarily represented by St. James United Church. There are 41 synagogues in this city in which the first synagogue in Canada was erected (Spanish-Portuguese, 1777).

Hospitals.—There are more than 65 hospitals of all kinds in the metropolitan area. These are financed one third by the provincial government, third by the municipal authority, with the remaining third being absorbed in indigent cases in the institution. Oldest hospital is Hôtel-Dieu, founded in 1642 by Jeanne Mance, and operated by the Hospitalières de Saint-Joseph Sisters; the present building, on Pine Avenue, was erected in 1861. Montreal General, home of the city's first medical school, was opened in 1822. Notre-Dame was founded in 1860 by Dr. Persillier Lachapelle who called in the Grey Nuns to manage it; rebuilt in 1921, it now faces Lafontaine Park, on Sherbrooke East. Royal Victoria Hospital, comprising a magnificent group of buildings, lies on the south slope of the Mountain. Erected in 1887, it was named for Queen Victoria, and endowed originally by Lords Strathcona and Mount Stephen, who donated a million dollars each. Hospitals of more recent foundation are too numerous to be enumerated here. One of these is the Sanatorium de Saint-Joseph, in Rosemont, a 500-bed hospital for the tubercular, erected in 1950.

Historic Sites, Monuments, and Buildings.—The walls of the old French town enclosed an area which is, today, Montreal's financial district. History is written all over the narrow streets where old and new buildings now alternate. It starts with Place Royale, on the water front, quaintly called "Le Berceau de (The Cradle of) Ville-Marie." An obelisk marks the spot where the first settlers landed, in 1642. Memorial plaques and monuments radiate from there, recalling a series of gallant deeds. In Place d'Armes, where Maisonneuve nearly lost his life fighting 200 Iroquois with 30 men, stands the superb bronze monument to this founder of Montreal, by the Canadian sculptor Philippe Hébert. Facing it are Notre-Dame Church (described above), and the Seminary of Saint-Sulpice, (1683), the oldest building still in use. Across is the Bank of Montreal, completed in 1848 by the architect Stanford White; its banking room is one of the largest and finest in the world. Aldred Building (1929) and other modern office

buildings flank the square. The Royal Bank of Canada Building, highest in the city (397 feet, 1928), is nearby, on St. James Street. Place Jacques Cartier includes the Nelson Monument, the picturesque Bonsecours Market, and the historic Château de Ramezay (1705), residence of French and English governors, today a museum. The upper part of the square was called Place des Jésuites in 1692; there lived Father Pierre François Xavier de Charlevoix, historian of New France. It comprises the City Hall (1878), built in Renaissance style, the Champ de Mars, an esplanade leveled over ancient fortifications, the Vauquelin Monument, and the Old Court House (rebuilt in 1850) where are treasured all public records, from the French regime to the present. Opposite is the New Court House (1922), also the Montreal seat of the provincial government. On Bonsecours Street nearby is the sailors' church of Notre-Dame-de-Bonsecours. Molson's Brewery, on Notre Dame Street, is another landmark of old Montreal, the first industry of its kind in the country; the vaults of 1782 are still in existence. At the foot of Jacques Cartier Bridge is the monument to the Patriots of 1837-1838. In Place d'Youville is the statue of John Young (1811-1878), who played an important part in the development of the harbor. There is a statue of young Queen Victoria in Victoria Square, one of King Edward VII in Phillips Square; from one to the other climbs Beaver Hall Hill, named after the residence of fur-trader John Frobisher, who used it as headquarters for the Beaver Club, founded in 1785. It is crowned today by the Bell Telephone Building (1929) and the adjoining Belmont Building (completed 1949); both largest and tallest telephone head office and toll buildings in the British Empire. C.I.L. House (Canadian Industries Limited), built in 1931, also stands in Beaver Hall Hill. The Canadian National Railway's Central Station, on Dorchester Street, faces the end of a tunnel, 3½ miles long, cut through the Mountain; its concourse features an artistic representation of Canadian life. In Dominion Square, where 100,000 tulips bloom every spring, a token of gratitude from the Netherlands government to the city after World War II, there are the Cenotaph erected by Montreal to its heroes of two world wars, the monuments of Sir John MacDonald, a Father of Confederation, and Msgr. Ignace Bourget, second bishop of Montreal, and the memorial to the Strathcona Horse Regiment, an outstanding piece of sculpture by the Canadian George William Hill. Surrounding the square are St. James Roman Catholic Cathedral; the Sun Life Building (1931), largest office building in the British Empire; the Dominion Square Building; the Windsor Hotel, the Laurentien Hotel; St. George's Anglican Cathedral; and Windsor Station and head offices of the Canadian Pacific Railway. The Radio-Canada Building, inaugurated in May 1951, is the latest link in the Canadian Broadcasting Corporation's world-wide radio system; located on Dorchester West, it is open to visitors. Also west, on Sherbrooke Street, are two martello towers, part of the fortifications erected in 1694 by the Sulpicians around their Fort de la Montagne; in one of these, Marguerite Bourgeoys taught Indian children.

There are many public halls of fine proportions and unusual quality in this city of few skyscrapers: Hall of Honor in City Hall; the banking rooms of the Bank of Montreal and the Royal

Bank of Canada; the reading halls of the Civic and St. Sulpice libraries; McGill University's Moyse Hall; and the University of Montreal's entrance hall and library among others.

Though all skyscrapers and many churches have lookouts, no tour of Montreal is complete without a drive to the mountain top which offers a magnificent view of city and river.

Museums.—The Montreal Museum of Fine Arts shows an interesting collection of Dutch, French, and British paintings, and a very representative one of contemporary Canadian paintings. Its collection of decorative arts includes French and German silver, South American textiles, and French-Canadian provincial furniture and handicrafts. It maintains a bilingual reference library, an art center for children, and a School of Art and Design under the direction of Arthur Lismer, founder of the famous "group of seven," which revolutionized Canadian painting. The Canadian Historical Museum depicts the life of early Christians and Canadian scenes in life-size wax figures. The Château de Ramezay is a repository of Canadiana in the hands of the Numismatic and Antiquarian Society. The McGill University museums, the Notre-Dame Church Museum, and the Commercial and Industrial Museum, all present special interest.

Parks and Playgrounds.—Montreal has over 2,800 acres of parks and playgrounds, of which Mount Royal Park is the largest. Blessed with a mountain in the heart of their city, Montrealers enjoy its 480 acres of natural park in all seasons. The mountain top is a vast hollow, the crater of a volcano; in the bottom is Beaver Lake, an artificial pond that really was a beaver pond at first. Nearby stands the Mountain Play-House. At the Chalet are presented summer concerts "under the stars," and two lookouts offer a magnificent panorama of city and river. Criss-crossed by riding and hiking paths, the Mountain is also a unique center of winter sports. A picturesque feature is the police ski-squad that patrols its slopes all winter. A winding path leads to the huge cross on the summit, lighted at night, and visible from a distance of fifty miles. Historic St. Helen's Island, named by Samuel de Champlain for his wife, lies in the St. Lawrence near Montreal Island and is reached through a side road leading from Jacques Cartier Bridge. It also is of volcanic origin and its strategic position made it in former times an excellent fortress for the French and then the British, while during World War II it was used to isolate German prisoners brought to Canada from the battlefronts. Many of its original earthworks and fortifications are still in an excellent state of preservation, and some of its acres have been landscaped into a beautiful park and recreation center. Another large park of interest is Lafontaine Park, with a lake for boating, a lovely luminous fountain, tennis and baseball courts; a school, a teachers' library, and a concert hall stand in its grounds. Part of Maisonneuve Park, the Montreal Botanical Gardens were established through the efforts of Brother Marie-Victorin, a widely-known botanist. An area of 260 acres and an educational and research center, it is the focal point of Eastern Canada horticulture, though it also displays collections of tropical plants. One of its most interesting initiatives is the children's individual gardens. Adjoining the botanical gardens are the municipal golf course and 18 tennis courts. Band concerts by the units of Montreal's

garrisons are given in city parks during summer.

Since 1940, the city acquired and developed 120 playgrounds where an educational program of folklore songs and dances, handicrafts, puppet shows, swimming lessons, and industrial visits is followed by children throughout summer. The Verdun Natatorium, one of the finest open-air swimming pools on the continent, is 200 feet long, has an adjacent diving pool and underwater lighting. Belmont Park, alongside the Rivière des Prairies, is a small version of New York's Coney Island.

Education.—There is no federal department of education in Canada as each province makes its own laws in relation to education. The Province of Quebec has two distinct school systems that operate under a common law; one for Roman Catholics, one for Protestants and other non-Catholics, an arrangement that is a tribute to the good-will of government and public bodies. In Montreal there are two great universities, McGill University (English, interdenominational) and the University of Montreal (French, Roman Catholic), 14 classical colleges, 11 technical schools, 3 normal schools, and hundreds of public and private ones. The education field is broad, its scope bilingual.

McGill University is the headquarters of Anglo-Saxon culture. Its founder was James McGill (1744-1813), a fur-trader from Glasgow, who bequeathed his house, Burnside Hall, 4½ acres of land and 10,000 pounds to the Royal Institute for the Advancement of Learning. Burnside Hall opened its doors as a university under royal charter in 1829. The first of McGill's 48 buildings was completed in 1843. The official entrance to the campus is through the beautiful Roddick Gates erected in 1924 in memory of Sir Thomas Roddick, first Canadian to be president of the British Medical Association. The university has eight faculties and as many schools; its School of Medicine is one of the most notable in the world. Affiliates are the Macdonald College of Agriculture and Household Science, and the Victoria College for Women. In McGill's Physics Building, Ernest Rutherford first split the atom; behind its ivy-covered walls Dr. Frederick G. Banting and Dr. James B. Collip discovered "Collip's mixture," later known as insulin. Its Neurological Institute, partly endowed by the Rockefeller Foundation, has a worldwide reputation.

On the north slope of Mount Royal, the University of Montreal is a masterpiece of modern architecture, grouping 16 units around a central tower 270 feet in height. First established in 1876 as a branch of the famous Laval University at Quebec, the University of Montreal obtained a pontifical and civil charter in 1919. It has 10 faculties and 27 affiliated schools and colleges. The university maintains a high tradition of classical education, its literary and scientific teaching rooted in the Sorbonne at Paris, its theological and philosophical methods coming from Rome. A Radium Institute was created in 1922 when the university was presented with one gram of radium by the provincial government; it is affiliated with the Curie Foundation in Paris and is recognized by the American College of Surgeons. Also of outstanding interest is the Experimental Medicine and Surgery Institute, under the direction of the internationally known Dr. Hans Selye after 1945.

The Montreal Catholic School Commission

operates 240 schools, 193 French, 47 English; a special committee looks after neo-Canadian children. The Protestant School Board operates 74 English elementary and high schools. There are 15 Jewish private schools with the same curriculum as the Protestant. A great number of technical, art, trade, and vocational schools sponsored by the provincial government have been established in the city, as well as schools for the deaf, the blind, and the crippled.

Classical education is almost entirely in the hands of religious orders, the Sulpicians, the Jesuits, and the Fathers of the Holy Cross. The congregation of Notre-Dame Sisters, founded in 1653 by Marguerite Bourgeoys, maintains the largest number of schools and colleges for girls in the country, and also has establishments in provinces in the United States.

The first Young Men's Christian Association on the North American continent was organized in Montreal (November 25, 1851), and today includes Sir George Williams College. The first English schoolmaster was John Pullman, who came from New York in 1773.

The duality of culture so typical of Montreal is likewise reflected in libraries: the Civic Library, bilingual, has many branches and a large collection of Canadiana; Saint-Sulpice, a reference library, is mostly French; Fraser Institute, McGill University's Redpath Library, Mechanics Institute, and Westmount Public Library are among the oldest institutions. All children's libraries are bilingual. Special libraries number over a hundred.

Both French and English groups have their own art, literary, musical, and historical associations, and often exchange guest speakers.

Recreation.—Montreal attracts larger and more enthusiastic musical audiences than any other city in Canada. The Société des Concerts Symphoniques de Montréal, founded in 1938, invites a large number of internationally known artists every year. First directed by Wilfrid Felleiter, former conductor of the New York Metropolitan Opera, the société later engaged Désiré Defauw as a permanent conductor; it presents summer concerts "under the stars" at the Chalet atop the Mountain, and arranges "matinées symphoniques" for children similar to the celebrated children's concert series led by Walter Damrosch. The Variétés Lyriques, founded in 1936 by Charles Goulet and Lionel Daunais, and actually co-directors of the troupe, give regular performances of musical comedy in French. And in the realm of song one must mention Les Disciples de Massenet, an outstanding mixed vocal group of 50, under the direction of Charles Goulet, which in 1950 won the Chicago Land Music Festival award. There is also a Ladies Morning Musical Club, a Women's Symphony led by Ethel Stark, several notable chamber music groups, and yearly music festivals.

Montreal, unfortunately, has no professional theater, but the Montreal Repertory Theatre, Little Theatre, Les Compagnons, and Negro and Jewish groups, to name but a few, fill a definite niche for those interested in amateur dramatics.

Montreal has eight radio stations, with the Canadian Broadcasting Corporation maintaining a large bilingual establishment. It entered the television field in 1951. Through its International Service, CBC speaks to the world in 14 languages.

In sports, Montreal is unrivalled in Canada.

Baseball, hockey, football, racing, tennis, golf, fishing, and riding are readily at hand everywhere. In winter, the Laurentian area just to the north of the city is one of the finest ski playgrounds in the world and attracts enthusiasts from the United States in large numbers, though all winter sports facilities are found in Montreal as well.

Economic Activity.—Center of the Dominion's industrial and financial activity, Montreal is undergoing an unprecedented development. Wheels of more than 3,000 factories whir to provide employment for 400,000 workers. Principal industries include the manufacture of railway rolling stock, aircraft, electrical supplies, tobacco products, brass and copper wares, vegetable products, boots and shoes, fur goods, paints and petroleum products; in the lead is the clothing industry. Along the river and canal banks are to be found rolling mills, packing industries, breweries, and shipbuilding and repair plants. Montreal handles the largest grain shipping-trade in the world. Industry alone consumed 2 billion kilowatts in 1950, a fraction of Montreal's vast reservoir of electric power. The increase in commerce is also phenomenal: between 1940 and 1950, 150,000 new jobs were created, and purchasing power increased in proportion; 2,860 new stores opened and merchants did a billion dollars worth of business.

Finance is centered on St. James Street, where the two largest banks of the country have their head offices; the Royal Bank of Canada, with 700 branches in Canada and foreign countries, and the Bank of Montreal, with 500 branches. There are, in all, ten chartered banks with head offices in the city, and 400 branch banks. Canada's leading life insurance company, the Sun Life Assurance Company, and most prominent trust companies also maintain their headquarters in the city.

Montreal's growth is reflected, too, in tonnage and passenger traffic through the harbor, in new hotels and railway stations, new airlines and terminals. Civic buildings number 150, and the civic budget is in the neighborhood of 100 million dollars.

Transportation.—Montreal is the hub of Eastern Canada's inland waterways system; the headquarters of Canada's two largest railway systems, the Canadian Pacific and the Canadian National; and an air crossroads of the world.

It is the seat of the International Air Transport Association and of the International Civil Aviation Association. From the Montreal airport at Dorval, planes arrive and take off daily for airfields all over the globe: called "a pilot's dream," it is not more than 10 miles from the center of the city. The Royal Canadian Air Force maintains a large Eastern Canada airbase at Montreal's St. Hubert Airport, and civil private aviation interest centers round Montreal's Cartierville Airport. There is also a hydroplane base.

Montreal is the converging point of all Canadian railroads and many lines from the United States. Motor coach lines and truck services operate between the city and important points in Canada and the United States. In June 1951, the city administration took over from a private company the management of Montreal Tramways, which operates throughout the city and suburban areas over 280 miles of track, and carries 350,000 persons annually. An electric railway

operated by Canadian National Railways runs through the tunnel under the Mount Royal in 9 minutes.

Three systems of canals converge at Montreal: the St. Lawrence canals, a connection with Fort William, 1,215 miles to the west on Lake Superior; the Ottawa River and connecting canals; and the Hudson-Champlain-Richelieu system, oldest water route in northeastern America, which connects the city with New York. The city is the headquarters, too, of eleven large steamship companies with regular service to all parts of the world.

Harbor.—The world's largest inland seaport, a thousand miles from the Atlantic, the Montreal harbor is closer by water to Liverpool than to any seaport in the United States. There is no tide to hamper operations, though for several months each winter the harbor area is in the grip of ice. It handles more grain than any other port in America. Dating back to the romantic period of sailing ships, and timber rafts rushing down the Lachine Rapids, it is today thoroughly modern, and berths ocean-going vessels which approach through a channel 35 feet in depth at low summer water. Equipment includes a terminal railway of 61 miles, completely dieselized; floating and locomotive cranes; fireproof grain elevators with a storage capacity of 15,000,000 bushels; a cold-storage warehouse with a capacity of nearly 3,000,000 cubic feet; and many fireproof transit sheds; all under the operation of the federal harbors board. In 1949, 4,480 vessels used the harbor, and landed a total of 185,000 passengers. Waterborne cargo tonnage loaded and unloaded was more than 13 millions of tons in the same year. Summer mean level of the port (and river) is 24 feet above sea level. The water area is about 12,000 acres, and the river is 2 miles wide between the city and the south shore.

Population.—Between 1900 and 1950 the population increased from 328,172 to 1,002,703 (estimated) for the city proper, and to 1,370,044 for Greater Montreal and its suburban towns. Among those are, on the islands: Outremont, Westmount, Hampstead, St. Laurent, Mount Royal, Montreal North, Rosemont, Montreal East, Pointe-aux-Trembles, Ville Lasalle, Lachine, Verdun, and Montreal West; on the south shore, connected with the city by Victoria, Mercier, and Jacques Cartier bridges; Longueuil, St. Lambert, Montreal South, Mackayville, and others. For reasons underlying the economic growth of the metropolitan area, the number of municipalities composing Greater Montreal has been extended from 46 in 1941 to 57 in 1950.

The proportional division of the population by racial origin has not changed noticeably in recent years, except for a slight increase in European immigrants after World War II. Approximately 67.1% are French, 19.5% British (including Irish and Scots), 6% Jewish; the remaining 7.4% being mostly Italian, Ukrainian, Polish, German, Chinese, and Negro.

The French and English languages are official, and the majority of the population is bilingual. There are 5 French and 3 English daily newspapers.

French as spoken by Montrealers is sometimes, and rather inaccurately, referred to as "patois" by English-speaking visitors. It is true that Montrealers, the working class especially, perforce include in their vocabulary a large number of locally accepted English words, some

without change, some oddly spelled, some mispronounced from an English viewpoint. The written French of the books and the press, however, and the spoken French of educated French-Canadian is as French as the speech of English-speaking Canadians is English. No English-Canadian are ever mistaken for English in England, and visitors from France readily understand not only Montrealers but French-Canadian "habitants" as well, whose language has retained much of the flavor of old France.

Municipal Administration.—The City of Montreal is divided into 11 electoral districts each of which sends six deputies—or councillors—to City Hall. Three are elected by all voters, three by property owners only. Thirty-three additional councillors are chosen by 13 public bodies determined by bylaw, such as the Board of Trade, the Canadian Manufacturers Association, and the universities. Thus, a total of 99 members form the council at the head of which is the mayor, elected by all electors. Elections are held every third year on the second Monday in December.

At the first sitting of the council six members are elected from within its own body to form the Executive Committee, two from each of the three groups. From among the six, a president and vice president are chosen by the council. Members of the Executive Committee receive a salary, while members of the council are granted indemnities. The council is the legislative body in the municipal government, while the Executive Committee administers the city's business from day to day.

The mayor represents the city at civic functions and on all official occasions, and acts as chairman of the council. In 1949 an act of the provincial legislature gave him additional power. He became a member *ex officio* of the Executive Committee and possesses all the powers, attributes, and prerogatives attached to such function. He is, moreover, a member *ex officio* of all the committees and commissions appointed by the council. He exercises the right of superintendence, investigation, and control over all the departments and offices of the city.

In addition to the council and the Executive Committee, there is a Montreal Metropolitan Commission which serves to coordinate the management of the city with that of the other outlying communities on the island. Its members are chosen by the municipalities concerned, and there is one representative of the provincial government.

History.—Outpost of French civilization is the heart of Indian barbarism, rallying point of missionaries and discoverers, strategic objective of enemy forces for more than a century, Montreal evokes a multitude of historical associations. The first European to view its site was Jacques Cartier, in 1535, who visited the Indian settlement of Hochelaga and climbed the mountain named, in the French of his time, Mont Réa (Mont Royal). Then came Samuel de Champlain who laid out a settlement he called Plac Royale on his second trip to the island, in 1611. Thirty years later in France, Sieur de La Dauversière, a burgher from La Flèche, and Jean Jacques Olier, founder of the Sulpician Order in Paris, had the same dream of a religious establishment in the still vaguely known region of Montreal. Through their efforts the Company of Notre Dame of Montreal was formed with the

three-fold purpose of establishing an order of priests to direct the settlers and convert the Indians, an order of nuns to nurse the sick, and another to teach white and red children. As neither Olier nor La Dauversière were in a position to lead the expedition, Paul de Chomedey de Maisonneuve (1612-1676) was chosen. He sailed in August 1641 with three vessels, two from La Rochelle and one from Dieppe; after the winter in Quebec, he continued his voyage up the river and landed on the island on May 18, 1642 with a small group of fifty settlers, including Jeanne Mance, Madame de la Peltrie and several Jesuit priests. Father Vinmont then celebrated the first Mass at Ville-Marie, the name by which the settlement was known until about 1700.

From that day four main works tell the story. The first is the fort built to protect settlers against the Iroquois on a triangle formed by the St. Lawrence River, the St. Peter River (now gone) and swamps later dried. It was flooded the same year at Christmas time and Maisonneuve vowed to carry a cross on his back to the mountain top if the waters receded. They did, and on January 6, Maisonneuve kept his promise. A lighted iron cross 103 feet high, erected in 1924 by the Société Saint-Jean-Baptiste, commemorates this act of faith. The second building, the Hôtel-Dieu founded by Jeanne Mance to care for the sick, was built in 1644, a little distance from the fort. Its small chapel was used as a first parish church. Burnt and rebuilt three times, it has stood on Pine Avenue since 1861. The school, the third building, was founded by Marguerite Bourgeoys in 1658, and at first occupied a stable 36 feet by 18. In those humble quarters the Sisters of the Congregation of Notre Dame started what is today one of the largest educational institutions in the country. Their founder was beatified by Pope Pius XII in 1950. The fourth building, the Seminary of Saint-Sulpice, built in 1685 and still in existence, was the home of the secular priests sent by Olier to found and administer the parishes. They became the feudal holders of the island, and their superior, Dolléir de Casson, was the first historian of Montreal. Notre-Dame parish church opened in 1683, and twice rebuilt, now stands beside the seminary on the Place d'Armes.

But there is more to Ville-Marie than a list of dates and facts. The full significance of its foundation cannot be understood without some knowledge of the terrible dangers that surrounded it, and of the manner in which they were met by a small group of dedicated men and women. The whole incredible adventure is neatly wrapped up in Stephen Leacock's understatement: "Whatever Montreal is today, it began well."

Under French regime until 1760, Montreal was the last place to surrender when Canada fell to the British. Governor Pierre François de Rigaud had no choice but to capitulate to Gen. Jeffrey Amherst, who refused all military honors. On the eve of capitulation Chevalier François Gaston de Lévis burned the French flags on St. Helen's Island (Sept. 7, 1760).

The great French explorers and missionaries Pierre de la Vérendrye, Louis Joliet, Robert de la Salle, Jean Nicolet, Jacques Marquette, Antoine de la Mothe Cadillac, Daniel Duluth, Louis Hennepin, Pierre Radisson and others, had endeavored to carry the name of France all across America to the "Western Sea," using Montreal as a starting point. When their country failed

to support such vast claims and lost Canada to the British, Montreal shifted from adventure to business, and settled down to make the most of its own wealthy possibilities. The first English-speaking immigrants were American merchants called locally "les Bostonnais," who came on the heels of General Amherst, and were soon joined by Scottish fur-traders; the English and Irish followed, and in 1778 there started to pour in the 40,000 American Loyalists who were to found the Eastern Townships and transform the country.

During the American War of Independence, Montreal was occupied by the Army of Congress under General Richard Montgomery, which remained from November 13, 1775 to June 17, 1776. Benjamin Franklin, Samuel Chase, and Charles Carroll were sent to convert Canadians to their cause. They brought with them a French printer, Fleury Mesplet, and their printing press, the first in Montreal, and were all lodged in the Château de Ramezay. When their mission failed and they left, both printer and printing press stayed behind. Mesplet got out a French newspaper, *La Gazette* (1778), which later became bilingual, and today is Montreal's English morning paper, oldest in the country. That was the last war invasion for Montreal. The War of 1812 and the Fenian Raids of 1870 had but little repercussion in a city busy expanding in every direction. Significant dates are the following: 1782, North West Company is formed (fur-trade is leading commerce), the timber and shipping trades are started; 1791, the Canada Act divides Quebec Province into Upper and Lower Canada, Montreal in the latter; 1800, the Court House is built, Montreal waterworks begun; 1803, the city knocks down its old walls and starts moving up the Mountain; 1809, John Molson's first steamship, the *Accommodation* is built and makes the first Quebec-Montreal trip; 1811, James McGill gives 10,000 pounds and 46 acres for a university; 1817, the Bank of Montreal is established; 1818 a police department is started with 24 night watchmen, the first Roman Catholic bishop arrives, Msgr. J. J. Lartigue; 1822, formation of the Board of Trade; 1824, a new Notre-Dame Church is erected; 1825, the Lachine Canal is opened; 1829, McGill University gets a royal charter; 1832, city is incorporated, the first mayor, Jacques Viger, is elected and gives the city its motto "In Concordia Salus"; 1836, first railway at Laprairie connects Montreal with New York.

In 1837-1838, however, this peaceful development was broken by a rebellion which centered in Montreal because that was where the French and the English were most mixed, and bitterness was most acute. It was inevitable that two peoples of such different backgrounds would struggle to reach a satisfactory form of government; it was unfortunate that the struggles had to turn into dreadful riots, and be dreadfully repressed. Patriots executed as rebels now have their monument at the foot of Jacques Cartier Bridge, and the whole episode reminds one of Charles James Fox's saying that "all saviours of their country have been called rebels."

Following the rebellion, the Union Act of 1840 reunited Upper and Lower Canada. Montreal was a parliamentary capital from 1844 to 1849, but lost this position when Montrealers burned their Parliament in a fresh outburst of anger over the Rebellion Losses Bill (1849).

Apart from riots, the city was harassed for

more than a century by disastrous fires, epidemics, and floods before public works took a hand. Yet commerce went on, intent on fixing Montreal's destiny as a transportation center. In 1843, the Bonsecours Market was built, its upper floor used as a civic reception hall; in 1851, the Harbour Commission was appointed, wharves built, the river dredged, and Montreal became an Atlantic port; in 1860, the Victoria Bridge was inaugurated, a tubular, 6,600-foot bridge, a triumph of engineering at the time. Railway expansion followed immediately. When the Confederation of Canada was proclaimed, on July 1, 1867, Montreal was already on its way to a metropolitan position. Increasing wealth and population meant extended suburbs, new industries, organized education, and development of public utilities. Laval University established a branch in Montreal in 1876, the municipal area was 30 square miles in 1883; telegraph, telephone, and electricity were installed, street railways replaced horse-drawn carriages in 1892, and an all-stone wall built with aid from the federal government to protect the city against spring floods was built in 1901. A 35-foot channel was begun in 1910; a 3½-mile tunnel was carved through the mountain rock in 1917; a 2-mile harbor bridge, later called Jacques Cartier, was built in 1930. Montreal became an airport in 1940; an air crossroads of the world in 1951.

Between the cross of Maisonneuve and the television aerial on top of Mount Royal are crowded three hundred years of fortitude.

CÉCILE SAINT-JORRE,
Civic Librarian, Montreal.

MONTREAL, University of, Montreal, Canada, until 1919 a branch of Laval University at Quebec, thereafter by virtue of an apostolic constitution and a royal charter becoming an independent, Catholic educational institution.

A construction program which began in 1931 has housed the university in what might be called one gigantic building, a central tower 270 feet tall with 16 unit-buildings grouped around it, the whole designed along strictly modern lines, in a university park of 200 acres.

In 1876, following a request from Msgr. Bourget, bishop of Montreal, to secure a Catholic university in his episcopal city, the Sacred Congregation of the Propaganda enjoined Laval University to establish a section at Montreal, to give therein the same instruction as at Quebec. This curriculum was inaugurated in 1878 in the faculties of theology and law, in 1879 in the faculty of medicine, and in 1887 in the faculty of arts. Since becoming independent, the university has possessed its own government and a complete local administration. It comprises the faculties of theology, law, medicine, philosophy, letters, sciences, and dental surgery, and schools of pharmacy, social, economic, and political science, a polytechnic school, and a school for commercial studies. The last two are affiliated schools, as are also the Agricultural Institute at Oka, a school of optometry and a school of veterinary medicine.

The university perpetuates the stages by which a degree was, and still is, reached in the University of Paris. The *baccalauréat* (B. ès A.) is an official certificate recognized by the government and showing that the student has successfully completed his arts' course leading to professional studies in law, medicine, or science. It is obtained before he leaves the affiliated insti-

tute, seminary, or college at which he has studied. Students who reach a certain standing in both letters and science obtain the B. ès A. The *licentiate* degree requires a course of two years in philosophy or letters or social sciences, and three years in theology or law or pure science. To obtain the Ph.D. in law, philosophy, literature, pure and social science, it is necessary to support successfully in public a thesis and propositions as in the French universities. The D. en Th., and the D. en M., or the M.D., are granted after examination.

Since 1922, the following colleges, all for young men, have become affiliated with Montreal University, each with secondary ranking, and each an institution in which courses and degrees are directly controlled by the university: the seminaries of Montreal, St. Hyacinthe, St. Thérèse, Joliette, and the colleges Bourget, St. Laurent, Valleyfield, L'Assomption, Rigaud, Sherbrooke, and several others. Marguerit Bourgeois College, the first school opened in the Province of Quebec for secondary instruction of young women, was inaugurated on Oct. 9, 1918. Instruction in this college falls into two sections: the English and the French. Each is independent of the other, and each has its own faculty. The college became, affiliated with Montreal University in February 1922, and its students receive, following the successful completion of their studies, the grade of *bachelier* precisely as in the colleges for young men. Five other colleges for young women have since been established.

In the main section of the university, the faculty of theology is conducted by the Grand Seminary of Montreal, directed by the priests of Saint Sulpice. The ordinary course is four years and three months, but a good many students remain an extra six months to prepare for a later doctorate of divinity. A large number of students go to the Canadian College, at Rome, to finish their formal education for the church. The faculty of medicine was originally incorporated in 1845 as the Montreal School of Medicine and Surgery; in 1891 it became the medical faculty of Laval University in Montreal; and in 1919 it merged with the University of Montreal. The faculty of dentistry, formerly the School of Dental Surgery of Montreal, became affiliated with Laval University in 1904, and in 1920 was made part of the University of Montreal.

Among other affiliated institutions with the university is the Institute of Instruction in Modern Pedagogy for women. Its program comprises general cultural courses in philosophy, the sciences, French and English languages and literatures, and of course the professional subjects. To be admitted to it one must have accredited standing from a normal school, or pass the examinations given by the Central Bureau of Catholic Examiners, or hold a certificate of equivalence to the passing of these examinations. The St. George Pedagogic Institute for men, founded in 1929, is a superior normal school of pedagogy. Its purpose is to complete the professional preparation of all those who choose teaching for a lifework.

MONTREUIL, môn-trü'y', town, France, in the arrondissement Sceaux and department of Seine, five miles east of Paris and north of Vincennes. It has a church dating from the 12th-14th century. The place is noted for its remarkably fine fruit, especially its cherry.

orchards. It processes mices and skins, has distilleries, and manufactures chemicals, metal containers, porcelain, and biscuits. Pop. (1946) 69,698.

MONTREUX, mōn-trü', resort, Switzerland, in the canton of Vaud and on the east shore of the Lake of Geneva. It comprises three communes: Le Châtelard (pop. 1950: 11,540), Les Planches (5,189), and Veytaux (695). Because of its beautiful scenery and mild, healthful climate the year round, Montreux is a popular tourist center and resort for invalids. Nearby is the Rochers de Naye (6,709 feet) and also the famous Castle of Chillon.

MONTROSE, mōn-trōz', a distinguished family in the Scottish peerage. WILLIAM GRAHAM, 4TH LORD GRAHAM, was created earl of Montrose in 1505. Most notable of his descendants was JAMES GRAHAM, 5TH EARL OF MONTROSE (1612-1650), who signed the National Covenant in 1638 and became foremost champion of the crown. In the Civil War he fought in Scotland for Charles I, who created him marquis in 1644. Captured by the Scots government, he was hanged and dismembered as a traitor.

MONTROSE, city, Colorado, and seat of Montrose County; altitude 5,810 feet; on the Uncompahgre River; served by the Denver and Rio Grande Western Railroad; 62 miles southwest of Grand Junction. Engineering projects of the 1930's provided irrigation for the Uncompahgre Valley, and fruits, grains, and vegetables are grown there. Sheep and cattle are raised and there is some mining. Nearby points of interest are the Black Canyon of the Gunnison National Monument, and the Gunnison Tunnel, a 15 mile bore through the mountains carrying water to Uncompahgre Valley. Incorporated in 1882, the city has mayor and council and a city manager. Pop. (1940) 4,764; (1950) 4,964.

MONTROSE, borough, Pennsylvania, seat of Susquehanna County; altitude 1,660 feet; 31 miles northwest of Scranton, on the Lehigh Valley Railroad. The surrounding region has dairy and turkey farms. Industries include the manufacture of machinery and shoes and there is a printing plant. The cool summer climate and the beauty of the region make the town a favored summer resort. The three-story brick courthouse with its domed cupola, and the borough hall, built in 1843 and originally a church, are notable buildings. The borough was settled in 1799 and incorporated in 1824. Government is by burgess and council. Pop. (1950) 2,075.

MONTROSE, seaport and royal burgh, Scotland, located in Angus County, 25 miles northeast of Dundee. It is on the North Sea at the mouth of the South Esk River which widens into Montrose Basin, a broad tidal lagoon to the west of the town. The river is crossed by a suspension bridge and a drawbridge. Besides being an important fishing center, the town carries on shipbuilding, sawmilling, and flax and jute spinning. Several excellent golf courses are located nearby and there are many summer visitors.

Montrose received its charter from David I in the 10th century. The town was rebuilt after

being destroyed by fire in 1244. It was here that John de Baliol surrendered to Edward I in 1296. Pop. (1951) 10,760.

MONTROYDITE, mōn-troi'dit, natural oxide of mercury, HgO, mined in Texas. It is named after Montroyd Sharpe, one of the owners of the mine where it was found.

MONTs, mōn, SIEUR de (PIERRE DU GUAST, dü gä'), French explorer and colonizer of Canada: b. Saintonge, France, about 1560; d. apparently between 1628 and 1632. He was educated in the Roman Catholic faith, but became a Protestant, fought on the Protestant side in the wars of religion, and was made governor of Pons in Saintonge. He made several voyages to America, and is believed to have accompanied Pierre Chauvin's expedition of 1600. In 1604 he secured a royal patent for planting a colony in New France, coupled with a trade monopoly for 10 years. In return de Monts and his company had to send out 60 colonists a year. In May he sailed from Le Havre with Samuel Champlain and the colonists and steered for Acadia, a loosely defined territory which included the present Nova Scotia, New Brunswick, and part of Maine. After exploring the Bay of Fundy, they discovered Annapolis Basin which they called Port Royal, and then explored and named the St. John River. De Monts established his colony first on the island of St. Croix, but the next year (1605) he moved it across the bay to Port Royal. He then returned to France with Champlain. His patent was canceled in 1607 and the Port Royal colonists returned to France. But in 1608 the patent was renewed for a year. De Monts then sent Champlain to found a trading post on the St. Lawrence; this was Quebec. Upon the death of Henry IV in 1610, de Monts lost favor at court. See also CANADA—Era of Early Discovery.

MONTERRAT, mōnt-sēr-rät', mountain, Spain, located in Barcelona Province, 30 miles northwest of Barcelona. About 4,070 feet high, it is jagged and deeply eroded, hence its old Roman name, *mons serratus*. It is famous for its ancient Benedictine monastery, composed, in part, of 13 hermitages, accessible only by steps hewn out of the steep rock, and founded on the spot where a miracle-working image of the Virgin Mary was found in the 9th century. It is said that the image was carved by St. Luke and brought to Barcelona by St. Peter in 30 A.D. It was enlarged and richly endowed by Philip II. Learned Benedictines had established themselves here as early as 976; and they and their successors formed a large library, which was destroyed when the monastery was pillaged by the French and partly destroyed in 1811. After the restoration of Ferdinand VII, the rebuilding of the monastery was begun, but was stopped again when the monks were expelled by the Carlists in 1835. The monastery has fallen more and more into decay since the abolition of the order to which it belonged. While living in this monastery Ignatius of Loyola conceived the idea of founding the order of the Jesuits. According to legend Montserrat was the site of the castle of the Holy Grail.

MONTERRAT, mōnt-sē-rät', West Indies, a British island of the Leeward group, almost

at the same distance (about 30 miles) from the islands of Nevis, Antigua and Guadeloupe. It is 32 square miles in extent, nearly two-thirds of which is mountainous and barren. Its culminating point is the Soufrière, a volcano 3,000 feet high. The climate is on the whole healthful. The principal exports are sugar, molasses, tamarinds and lime-juice, and the principal imports, cottons and clothing materials, hardware and other manufactures. Revenue (1929-30), £27,389; expenditure, £31,007; imports, £92,570; exports, £65,565. The government of the island is vested in the governor-in-chief of the Leeward Islands, who is represented by a commissioner, assisted by a nominated executive and legislative council. Plymouth, the capital (pop. 1,800), is on the southwest side of the island. The island was discovered by Columbus and was colonized by the British in 1632. It was twice in the hands of the French, but since 1783 has been uninterruptedly possessed by the British. Pop. 11,954, of whom not more than 200 are whites.

MONTT, Manuel, Chilean statesman: b. Petorca, Chile, 5 Sept. 1809; d. Santiago, Chile, 20 Sept. 1880. He was graduated from the National Institute in Santiago and was engaged as instructor there until he entered upon his political career. As assistant secretary of state he sternly suppressed the revolt of 1837, and in 1838 was made a judge of the Supreme Court. His election to the chamber of deputies followed and he was for a time president of that body. He was Minister of Justice 1841-45 and of the Interior 1846-48, was elected President in 1851 and under his firm, conservative policy a succession of revolts were crushed, many industrial improvements were introduced and the laws reorganized and codified.

MONTUCLA, môn'tú'klá', **Jean Étienne**, French mathematician: b. Lyons, 5 Sept. 1725; d. Versailles, 18 Dec. 1799. He was surveyor-in-chief of the royal buildings in Paris (1766-92). He wrote 'Histoire des recherches sur la quadrature du cercle, etc.' (2d ed., Paris 1831); 'Histoire des mathématiques' (ib. 1758, 2 vols.; 2d ed., 1799-1802, 4 vols.), the first and most important work on the scientific history of mathematics up to the time of Moritz Cantor (1860).

MONTYON (môn-tě-ôn) **PRIZES**, rewards from a fund left in charge of the French Academy by Jean Baptiste Robert Auger, Baron de Montyon (b. 1733; d. 1820), a French economist and philanthropist and a friend of Franklin. He founded in his lifetime six prizes, of which two, that for useful discoveries in the arts, and that for valuable medical discoveries, lapsed after his death. The others are (1) a prize, founded in 1782, granted annually to the author of a literary work adjudged the most beneficial to the temporal good of mankind; (2) a prize, founded in 1782, for the most important discovery making more healthful the occupations of workingmen; (3) a prize, founded 1783, to promote mechanical research, and (4) a prize, first given in 1783, for the most heroic act on the part of any poor French citizen. For each of these prizes he left a capital fund of 10,000 francs (\$2,000).

MONUMENTA GERMANIÆ HISTORICA, a great historical work dealing with the

monuments and antiquities of Germany, the first volume of which was published in 1826. It was begun in 1819 and later was placed under the direction of the Prussian Academy of Sciences. Well over one hundred volumes have been issued.

MONUMENTAL INTERIOR DECORATION. See INTERIOR DECORATION.

MONUMENTS. The term monument is applied to structures which are characteristic or remarkable on account of their being erected as memorials, and also, though loosely, to those buildings which express some form of worship, or have peculiar prominence on account of their beauty, proportion or grandeur. In modern times, churches are often erected as memorials to individuals, and yet the term monument is not applied to them except in the vague general sense named above. It is evident, therefore, that such buildings may be commemorative monuments, as well as columns or tombs. Sepulchral monuments are the memorials most commonly erected. In Egypt, pyramids are monumental on account of their size, showing very little of so-called architectural art. There are about 100 of these, each containing a room which was used as a royal sepulchre. The Great Pyramid built by Khu-fu, called by the Greeks, Cheops, about 950 B.C., measures 764 feet square at its base and is 482 feet high. As Saint Peter's, at Rome, is about 15 feet less in height, it could be covered by the side of this pyramid. In Assyria and Chaldaea there are few temples and no tombs remaining of sufficient architectural importance to be classed as monuments. Important buildings in these countries were placed on huge mounds or terraces of earth, which raised them above the surrounding country, but as these structures were mainly of unburned bricks, they have fallen into shapeless mounds.

The earliest existing Greek monuments are found at Mycenæ and Tiryns. The Lion Gate at Mycenæ shows two large lions rampant on each side of a column, carved in bas-relief above the lintel; and this sculpture is wholly monumental in character, related both to religious and dynastic associations. The gateway at Mycenæ is one of the earliest of porches or towers of entrance which were among the chief monuments of Greek art: these were the Propylæa of which the most important was that of the Acropolis of Athens, with the small Ionic temple of Nike Apteros close by. The choragic monument erected by Lysicrates to commemorate his choral victory may still be seen at Athens. This was built at the time of Alexander's conquest, when Athens was declining and Asia Minor was being filled with magnificent temples of the Corinthian order. Other choragic monuments still exist at Athens in a partly ruined condition. The Tower of Winds, or Clepsydra of Andronicus, was erected at Athens about 100 B.C., but this was rather a utilitarian structure, as it served as a measure of time. Other Greek monuments were the Arch of Hadrian, of the later Roman period; entrances to other temple sites, similar to the Propylæa of the Acropolis, as that of Eleusis; theaters, colonnades, stadia and gymnasia. Greek tombs that remain at the present time are nearly all to be found in Asia Minor, the best known being the Mausoleum at Halicarnassus. The

small Greek monuments and tombstones are very simple and refined in detail. Of the same epoch are the rock-cut tombs of Asia Minor. Some of these are of great beauty, the exterior face of the living rock having been smoothed and made vertical, and adorned with magnificent bas-reliefs of very large size.

The principal Roman monuments were on a large scale, the rough work being executed by cheap labor, soldiers, barbarians or slaves. The Roman Forum was crowded with temples, arches and individual memorials. Arches were characteristic products of Roman civilization and were generally erected in honor of some victorious general or in commemoration of some great event.

Columns were also frequently erected. The column of Trajan is still standing in Rome. It is 133 feet high and has a spiral line of figures in relief from the foot to the top of the shaft, showing the story of one of Trajan's campaigns. There is a staircase within the column leading to the top. The sepulchral monuments of the Romans were generally small. One of the larger ones was the circular tomb of Hadrian, now the castle of San Angelo. Small sepulchral monuments lined the sides of Roman roads for miles outside the city. Many have been found at Pompeii. The tomb of Cæcilia Metella, a characteristic example, was built by Crassus, about 60 B.C. It was circular in plan, with a square base.

The principal monumental buildings of the Byzantine period were in Syria, where from the 4th to the 8th century what we call Syrian architecture was in full luxuriance. The noble domes of cut stone are, together with the churches and villas built of the same material, rather Græco-Syrian than strictly Byzantine in construction and design. Romanesque architecture in western Europe has not left us many monuments of great size and importance, but some tombs of great beauty remain in the churches of England, France and Germany.

MONVEL, Louis Maurice Bou et de, loo-è mō-rēs boo-tā dē mōn-vēl, French painter and illustrator: b. Orleans, 1850; d. 16 March 1913. He studied with Rudder, Cabanal and Carolus Duran, with the last, after some work in the Atelier Julien. His first picture exhibited in

the Salon appeared in 1874. He preferred the decorative to the realistic effect in color and modeling. The illustrations which he made for the 'Life of Jeanne d'Arc' (1897) in the *Century Magazine* are supremely successful both in line and color. In the Memorial Church at Domrémy he has painted six panels illustrating the career of La Pucelle. Among his best-known pictures is 'The Apotheosis' (1885) and his portraits are famous.

MONYPENNY, William Flavelle, English journalist: b. 1866; d. 23 Nov. 1912. He joined the staff of the London *Times* in 1893, and in 1899, shortly before the outbreak of the South African War, became editor of the *Johannesburg Star*. Under his direction the *Star* had strongly advocated the cause of the Uitlanders against the Kruger régime. The Boer President ordered his arrest, but Monypenny escaped in female garb and joined the Imperial Light Horse. He went through the siege of Ladysmith and after the war returned to his editorial duties in Johannesburg. He disapproved of the Chinese Labor Ordinance and resigned, returning to England in 1903. He was there appointed to write the authoritative 'Life' of Disraeli, but died before the work was completed. It was carried on by Mr. George E. Buckle, retired editor of *The Times*.

MONZA, mōn'zā, Italy, a town of Lombardy in the province of Milan, 11 miles by rail northeast of Milan, on the Lambro. The town is of great antiquity and has a quiet, venerable air. The most remarkable edifice is the cathedral of Saint John the Baptist, originally founded at the end of the 6th century by the celebrated Lombard queen, Theodolinda, but subsequently renovated and enlarged. It contains the iron crown of Lombardy, which according to tradition was beaten out of one of the nails used at the Crucifixion and which was restored to the Italians by Austria in October 1866, as well as various other relics and some valuable art treasures. There is also an old imperial palace surrounded by a large and well-laid-out park. It has been a residence and the place of coronation of the kings of Lombardy for 900 years. Here, while on a visit, King Humbert of Italy was assassinated 29 July 1900. It has a technical school, a lyceum and gymnasium and there are manufactures of silk, hats, leather, bricks, tiles and sausages, for which the town has long been famous. Pop. 43,000.

MONZONITE, an igneous rock of granular texture often quarried and sold as "granite" which it closely resembles. In mineral composition, however, it is intermediate between syenite and diorite; both alkali feldspars (or orthoclase) and lime-soda feldspar (or plagioclase) being present in approximately equal amounts.

MOODY, Dan, American public official: b. Taylor, Texas, 1 June 1893. He was educated at the University of Texas, and admitted to the Texas bar in 1914. From 1920 to 1922 he was county attorney of his native county, Williamson, and the following three years district attorney of the 26th Judicial District. It was while he was attorney general of Texas in 1925-26, that he came into national prominence by his opposition to the Ferguson régime in

Texas politics, which led to the defeat of Mrs. Miriam A. Ferguson for re-election as governor, and to his own election for the 1927-1929 term. He was re-elected for the 1929-1931 term.

MOODY, Dwight Lyman, American evangelist: b. Northfield, Mass., Feb. 5, 1837; d. there, Dec. 22, 1899. Attending school until he was 13, he then worked on neighboring farms for a few years and at 17 became a clerk in his uncles' shoe store in Boston. While there he joined the Congregational Church. In 1856 he went to Chicago, became a traveling salesman for a wholesale shoe firm, and was soon making a good income. His main interest, however, was religion and human welfare, and in 1858 he organized a Sunday school in connection with which he developed a program of social welfare work. In 1860 he resigned from business to give all his time to this work. During the Civil War he served with the United States Christian Commission in their service to the troops, often working at the front. In 1863 he organized and built an undenominational church in Chicago, and in 1866 became president of the Chicago Young Men's Christian Association. For them he built Farwell Hall (sponsored by John V. Farwell), the first YMCA building in America. With the organist and singer Ira D. Sankey, Moody went to England in 1873 to conduct a remarkably successful series of revivals throughout the British Isles, in which the evangelical churches cooperated. After his return to the United States in August 1875, he made his home at Northfield, and for the next six years conducted revivals in cities from Boston to San Francisco.

Meanwhile, encouraged by Henry F. Durant, founder of Wellesley College, Moody established the Northfield Seminary (1879) for girls, and in 1881 Mount Hermon School for boys. That same year he returned to England, by invitation, to conduct a second series of evangelistic meetings which continued until June 1884. It was at one of the London meetings which closed this series that Wilfred T. Grenfell was inspired to devote his life to medical missionary work in Labrador. Moody spent the years from 1884 to 1891 in evangelistic work in the United States and Canada, in 1889 founding the Chicago Bible Institute (now called the Moody Bible Institute). University students in both Great Britain and the United States were interested in his work. In 1886 he held a conference of college students at Mount Hermon, and the following year in Northfield. At this meeting Henry Drummond gave his address on *The Greatest Thing in the World*, which has become an American classic. Held annually, these conferences stimulated the growth of the YMCA and similar student organizations in colleges. In 1891 Moody was again in England, and visited Palestine in 1892. From May to November 1893 he conducted evangelistic meetings in Chicago during the World's Fair. His sincerity and pronounced business ability gained him the confidence of responsible businessmen who supported his work. His preaching was simple, vigorous, and moving, emphasizing God's love rather than the terrors of hell. He accepted no financial profits, and all royalties from the Moody and Sankey hymnals were administered by a board of trustees chiefly for the endowment of the Northfield schools.

Consult Drummond, Henry, *Dwight L. Moody: Im-*

pressions and Facts (New York 1900); Bradford Gamaliel, *Dwight L. Moody, a Worker in Souls* (New York 1927), with bibliography; Erdman, Charles Rostbury, *Dwight L. Moody, his Message for Today* (New York 1928); Moody, William Revell, *Dwight L. Moody* (New York 1930).

MOODY, James, American Loyalist spy: b. New Jersey, 1744; d. Weymouth, Nova Scotia April 6, 1809. He was a New Jersey farmer; the outbreak of the American Revolution, in 1777 joined the British forces and soon became the most noted British spy of that period. Daring and unscrupulous, he spied on the troops at Washington, Gen. John Sullivan, and Gen. Horatio Gates. In the latter part of 1780 he was captured and imprisoned at West Point, but made his escape. Because of impaired health, he went to England in 1782, where he was given a pension of £100 a year and an award of £1,330 for his services. Obtaining a large grant of land on the Sissibou River in Nova Scotia, he settled there in 1786 and served as a colonel of militia until his death. He published an account of his adventures, called *Lieutenant James Moody Narrative of His Exertions and Sufferings in the Cause of Government Since the Year 1777* (2d ed., London 1783).

MOODY, John, American financial writer: b. Jersey City, N. J., May 2, 1868. At first engaged in newspaper work, in 1890 he entered the employ of Spencer Trask and Company, investment bankers, remaining with them ten years. In 1900 he founded *Moody's Manual of Railroads and Corporation Securities* which he edited until 1907. In 1905 he founded *Moody's Magazine*, an investor's monthly, and in 1907 the annual, *Moody's Analyses of Investments*, both of which he edited. He also wrote *The Truth About the Trusts* (1904); *The Art of Wall Street Investing* (1906); *The Investor's Primer* (1907); *How to Invest Money Wisely* (1912); and other books. His autobiography was published in two volumes, *The Long Road Home* (1933) and *Fast by the Road* (1942).

MOODY, William Henry, American lawyer and public official: b. Newbury, Mass., Dec. 1, 1853; d. Haverhill, July 2, 1917. Graduated from Harvard in 1876, he studied law in the office of Richard Henry Dana, author of *Ten Years Before the Mast*, and began practice in Haverhill. He was city solicitor for a time, and from 1890 to 1895 was district attorney for the Eastern District of Massachusetts. He also served as a special assistant prosecutor in the Lizzie Borden murder trial. Elected to Congress by the Republicans in 1895, he was re-elected three times. He was secretary of the navy (1902-1904), succeeding John D. Long, and attorney general of the United States (1904-1906), succeeding Philander C. Knox. On Dec. 17, 1906 he was appointed an associate justice of the United States Supreme Court, but resigned in 1910 because of ill health.

MOODY, William Vaughn, American poet and playwright: b. Spencer, Ind., July 8, 1866; d. Colorado Springs, Colo., Oct. 17, 1910. After graduating from Harvard University in 1888 he became assistant in the English department there the following year. In 1895 he was appointed instructor in English at the University of Chicago and assistant professor in 1901, but

resigned in 1907 to devote all his time to writing. Besides his *Poems* (1901), he wrote the verse drama *The Masque of Judgment* (1900), and *The Fire-Bringer* (1904), a Promethean drama in verse. With Robert Morss Lovett he wrote the textbook *A First View of English Literature* (1905), the income from which enabled him to travel and write the play *The Sabine Women*, which Margaret Anglin produced in 1906 as *The Great Divide* (q.v.). It was a pronounced success. His next play, *The Faith Healer* (1909, q.v.), had high merit but was not so successful. His *Ode in Time of Hesitation* (1900) is considered his best poem. His complete works were published in three volumes in 1912, and *Some Letters of William Vaughn Moody*, edited by Daniel Gregory Mason, in 1913.

(consult Lewis, Edwin Herbert, *William Vaughn Moody* (Chicago 1914); Henry, David D., *William Vaughn Moody: a Study* (Boston 1934).

MOON, mōon, **William**, English philanthropist; b. Horsemonden, Kent, England, Dec. 18, 1818, d. Brighton, Sussex, Oct. 10, 1894. He studied for the church, but becoming totally blind in 1840, turned his attention to teaching the blind, using various systems of embossed type with which he was familiar. In 1845 he invented a simplified system of his own, using a modified form of Roman capitals with very few contractions. He had discovered that the 26 letters of the alphabet are basically nine characters placed in different positions. In 1848 he invented an inexpensive process of stereotyping. He produced the embossed *Pictures for the Blind* which enabled them to "realize" the forms of common objects, and he published embossed diagrams for geometry, music, and geographical and astronomical maps. Through his efforts, societies and lending libraries for the blind were widely established. He was a fellow of the Royal Geographic Society (1852) and of the Society of Arts (1859); the University of Pennsylvania conferred the honorary LL.D. degree on him in 1871. He visited the United States in 1882. See also **LIBRARIES**—3. *United States Libraries*.

MOON, the satellite of the Earth, around which, bound by the force of gravitation, it revolves in a monthly cycle of phases. This recurring lunar cycle was used by many early peoples both to denote the passing of the months and to establish a rudimentary calendar (q.v.); today, the paschal full moon is still used by the Christian Church to fix the dates of important religious holidays and festivals (see **EASTER**; **EPOCHS**). The position and motion of the Moon are of deep practical importance in navigation and in computation of the tides (q.v.), and the lunar orb unquestionably plays an aesthetic role as a purveyor of light and beauty in the sky.

Despite many prevalent superstitious beliefs, the Moon has no proven effect on day-to-day weather, the growth of crops, or many other fanciful representations ascribed to it. Its physical effects are manifest solely in: (1) its gravitational influence on the production of tides in the waters of the Earth and to a minute degree in its atmosphere; (2) certain minor daily variations in the Earth's magnetic field; (3) a cumulative tidal action in altering the speed of the Earth's rotation (see **SOLAR SYSTEM**).

Astronomically, the Moon is a solid, very nearly spherical body, 2,162 miles in diameter,

which shines wholly by reflected light from the Sun, and makes the circuit of its orbit once each lunar month (see data of Table 1).

Table 1—LUNAR DATA

Diameter (linear)	2,162 mi.	
Average apparent (angular) diameter	0.5°	
Average (mean) distance from Earth	238,857 mi.	
Least distance from Earth (at <i>perigee</i>)	221,463 mi.	
Greatest distance from Earth (at <i>apogee</i>)	252,710 mi.	
Average <i>albedo</i> (reflectivity of surface)	0.07	
Physical constants (Earth = 1)		
Mass 0.0123	Surface area 0.037	Surface gravity 0.1645
Volume 0.02	Density 0.60	Density (water = 1) 3.33
Mean geocentric horizontal <i>parallax</i>	57' 2.7"	
Average daily angular motion in orbit	13°	
Eccentricity (q.v.) of orbit	0.05490	
Inclination of orbit to ecliptic plane	5° 8'	
Inclination of orbit to Earth's equator	(max.) — 28.5° to + 28.5° (min.) — 18.5° to + 18.5°	
Period of <i>sidereal</i> revolution and rotation, the time between two successive meridian transits of the same star	27 ^d 7 ^h 43 ^m 11.5 ^s	
Period of <i>synodical</i> revolution, from <i>conjunction</i> to <i>conjunction</i> (approximately new moon to new moon)	29 ^d 12 ^h 44 ^m 2.8 ^s	

Surface Features.—The selenography, or surface description of the Moon, includes:

Maria.—These are the so-called lunar seas, named by Galileo because of their darker shade and resemblance to sizable bodies of water. Actually, the *maria* are broad, flat plains, which appear dark because of their smoothness and lesser reflectivity compared with the rough surface of adjacent mountains. Fig. 1 identifies the largest of these *maria* by their Latin names.

Mountains.—The principal mountains and mountain chains of the Moon are as large as the largest on Earth, and have been given similar names. The Apennines reach 18,500 feet above the floor of the *Mare Imbrium*; the Caucasus Range has approximately the same elevation; and the Alps average 12,000 feet. The Leinitz Mountains near the south pole of the Moon tower to 30,000 feet, as high as Mt. Everest, the highest peak on Earth. The altitudes of such features of the Moon may be determined from the lengths of the shadows cast by them when the Sun is at a known angle.

Craters.—More than 32,000 of these ringlike formations dot the visible face of the Moon, and may be divided into three classes: (1) craters proper, 4-12 miles in diameter, with a central volcanic cone; (2) ring plains, 20-60 miles wide, with central floors always lower than the surrounding plain; (3) walled plains, 40-150 miles wide, usually surrounded by several crater walls.

Among the largest of the walled plains is Grimaldi, 147 miles in diameter (see Fig. 1). The circular rim of this crater, although towering as much as 20,000 feet above the lunar surface, would still be below the horizon and invisible to an observer standing at its center. Plato, a walled plain 60 miles wide, located to the east of the lunar Alps (see Fig. 1), is noteworthy for its smooth central floor, conspicuously dark in appearance. Other principal craters may be identified from the key diagram.

The origin of lunar craters is a mystery. One

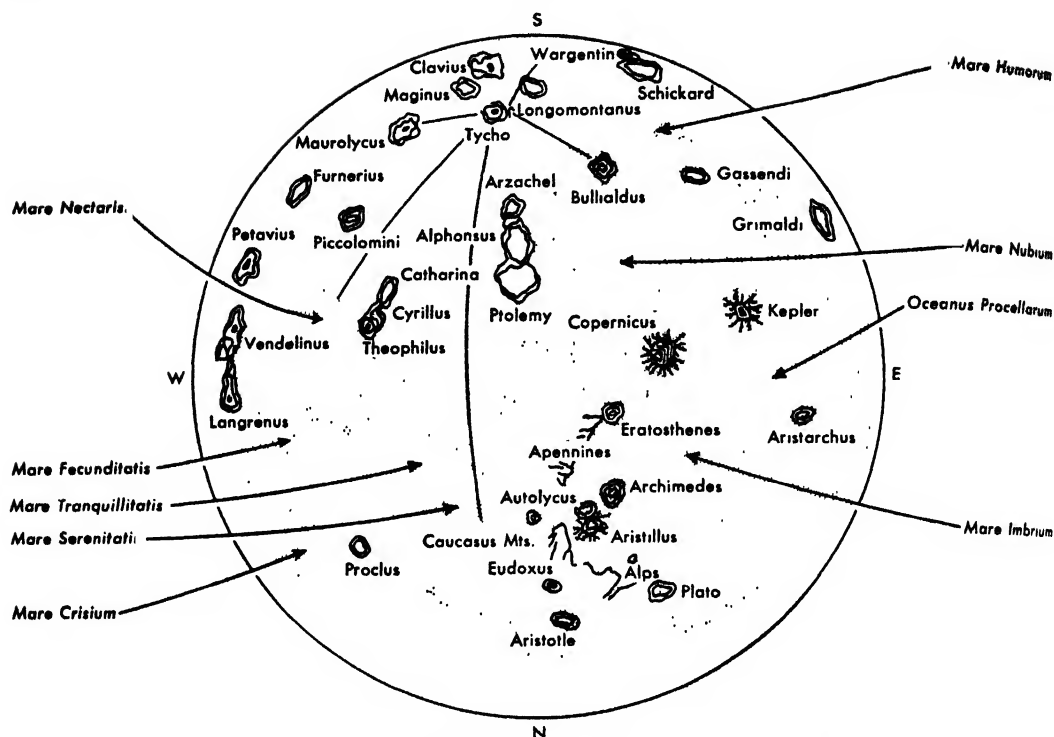

Fig. 1. Key to photograph of Moon opposite (as seen in an inverting telescope).

theory ascribes their origin to the action of meteorites (q.v.). Since the Moon has no protecting blanket of atmosphere to retard the passage of meteorites, these small missiles fall with tremendous speeds toward the lunar surface constantly. Proponents of the meteoritic theory argue that the effect of such activity near the end of the long period of time during which the Moon was in a molten state may have been responsible for at least the smallest craterlike "splashes" which cover the lunar surface. More conservative scientists have argued for the gradual release of internal gases as the cause. Other lines of evidence are used to show that they may be of volcanic origin. Still other scientists more recently have maintained that the craters were formed by explosions within the molten material of the lunar crust, caused by the heat of impact of meteorites. The large craters closely resemble such explosion pits.

Rays, Rills, and Clefts.—At time of full moon (see Fig. 1), long fingers of light appear to radiate from the craters Tycho, Kepler, Copernicus, Aristarchus, and others, and extend for hundreds of miles. These bright streaks, probably produced by glint from outthrown, finely pulverized products of explosion, are called rays. Long, narrow rifts or valleys in the lunar mountains which appear dark because the Sun's rays do not penetrate to the bottom, are called rills; corresponding fissures in the lunar plains are called clefts; both features are usually less than $2\frac{1}{2}$ miles in width. The Straight Wall is an escarpment 900 feet high, 60-70 miles long, located near the crater Thebit.

Physical Conditions on the Moon.—In contrast to the ever-changing panorama of relief on the Earth, the Moon is a changeless world, without winds, weather, or forces of erosion other than alternation of heat and cold. Its features stand gaunt and unworn, although some exfoliation

(q.v.) may occur in the abrupt thermal change (270°F. in one hour) caused by lunar eclipses.

The length of the lunar "day" is equal to one half the synodical revolution period of 29.53 earth days. Affected by this slow rotation, during each lunar day, the temperature of a point on the sunlit surface rises gradually from -58°F. at sunrise position to 214°F. directly beneath the Sun at "noon," and then falls again to -243°F. at "midnight." However, since there is no atmosphere on the Moon to soften or absorb the Sun's radiant heat the transition from hot to cold may be very sudden when moving from light to shadow on its surface. A point on the Moon exposed to the Sun's direct overhead rays remains at a temperature above the boiling point of water, but when it is subjected to complete darkness, as in the sharp-edged shadow of a crater or mountain, the temperature must drop rapidly to well below the freezing point of water. However, with no atmosphere, there can be no water on the Moon. Any water once present would long since have boiled away by the recurring high temperature of its surface. The lack of any atmosphere is confirmed by the instantaneous, rather than gradual disappearance of a star behind the Moon's limb at the time of an occultation (q.v.). Without air to transmit sound, the Moon is a totally silent world, and from its surface, the Sun shines in an absolutely black sky.

The force of surface gravity (see GRAVITY) on the Moon is only about $\frac{1}{6}$ that on Earth. Accordingly, a person who could, in jumping, raise the center of gravity of his body 3 feet above the Earth's surface, could leap 18 feet vertically on the surface of the Moon with the same energy expended. It is this same small attraction of surface gravity which is responsible for the loss of lunar atmosphere. Because of the high speeds of molecular motion in gases, compared with the

MOON

Moon's low velocity of escape, any such atmosphere once formed has long ago diffused into outer space.

The surface of the Moon has a reflectivity, or albedo (see Table 1), which resembles that of volcanic ash or pumice, a good heat insulator and poor absorber. If, as seems probable from other evidence, a layer of such ash covers the lunar surface, the heat of the Sun's rays cannot be absorbed far below the surface as a source of reradiation and warmth during the lunar night. The above facts, especially the absence of a breathable atmosphere on the Moon, its lack of water and other life-sustaining essentials, can hardly be said to encourage the existence of a high order of animal life on the satellite, although basic forms of plant life might possibly survive.

Lunar Phases, Rotation, and Revolution.—

The reason for the changing lunar phases is shown in Fig. 2, which illustrates the cycle from new moon to crescent, first quarter, gibbous, and full as the Moon in its orbital motion changes in relative angular aspect with respect to Earth and Sun; and

Fig. 2. Phases of Moon. Inner rings of discs shows portion of Moon illuminated by Sun; outer ring, the Moon as seen in sky, with horizon toward E.

the reverse cycle through gibbous to last quarter to crescent and back to new moon.

In the dynamic process which created it (see Cosmogony) the Moon attained a distance from the Earth in which its period of revolution became exactly equal to its period of rotation. In Fig. 3, the revolution of the Moon around the Earth is represented by the motion of a watch twirled about a central point on a string. During the course of one revolution, while the 12 o'clock position of the dial is at all times directed inward toward the center of the circle, the figure 12 successively points in all directions in space. The watch must therefore have rotated once on its axis. Because the Moon's rotation and revolution periods are exactly equal, in the same fashion it always keeps one face turned toward the Earth.

However, certain actual and apparent motions of the Moon known as *librations* enable us to see slightly more than half of the satellite's surface. *Libration in longitude* is due to the fact that the Moon does not move in a circle as does the watch in Fig. 3, but in an ellipse. In accordance with Kepler's laws (q.v.), the Moon must move faster in the portion of its orbit M_4 to M_1 to M_2 , when it is closer to the Earth, than when farther from the

Earth between M_2 , M_3 , and M_4 . Since between M_1 and M_2 the Moon revolves through 96° rather than 90° of its orbit, but its angular rotation remains the same (90°), we are allowed to see an average $7\frac{3}{4}^\circ$ more around the western edge. At M_4 , we can see $7\frac{3}{4}^\circ$ around the eastern edge; at M_1 and M_2 , the Moon is seen in "stage center." In a similar fashion (see Fig. 4), at time of moonrise and moonset, the daily rotation of the Earth brings us to a position laterally 4,000 miles farther out from the line of centers connecting Earth and Moon, thus permitting a view about 1° around the edge (*diurnal libration*). Also, since the Moon's orbit is slightly

Fig. 3. Libration in longitude, showing why the Moon always keeps one side turned toward Earth, yet how we are permitted to see more than one half of its surface. (See text explanation.)

inclined to that of the Earth around the Sun, when the Moon moves farthest north or south in its orbit, we may then see $6\frac{1}{2}^\circ$ over the top or underneath (in figurative terms), a phenomenon called *libration in latitude*. Finally, because of a slightly greater diameter in the direction toward Earth, produced by tidal attraction, the Moon wobbles a little bit in a motion known as *physical libration*. As a result of all these variations, the same 41 per cent of the total surface area of the Moon is visible at each full moon, 41 per cent is never seen, and a varying 9 per cent of the remaining 18 per cent affected by librations will be turned toward the Earth at any instant of time. It is thus possible

Fig. 4. Diurnal libration, and effect of augmentation.

over a space of time to see 59 per cent of the Moon's surface from Earth.

Common Lunar Expressions and Phenomena.—The full moon occurring nearest to the autumnal equinox, September 23, in the Northern Hemisphere, is known as the *harvest moon*. The name arises from the fact that, at this time, the full moon appears to hang suspended low on the eastern horizon at sunset, and rises very slowly, providing extra hours in the day for the farmer to harvest his crops. The effect is especially noticeable in high latitudes and is produced because, at the time of the autumnal equinox, the orbit of the Moon is inclined at a shallow angle to the horizon; thus the Moon's vertical motion is very gradual.

The common allusion to "the old moon in the new moon's arms" refers to a faintly luminous lunar disc cradled between the horns of a thin crescent moon and lighted by earthshine reflected back to the Moon by the "full" Earth.

The paradox in which the Moon's apparent size is actually a trifle larger when seen in the zenith directly overhead than when seen on the horizon is known as *augmentation* (see Fig. 4). When seen at position Z, in the zenith, the Moon is 4,000 miles nearer an observer on the Earth's surface than when seen from H or H', just rising or setting. The Moon in the zenith is lost in the vault of the heavens with no known reference objects against which to gauge its size, and hence psychologically it seems very small. When seen against the horizon, projected alongside objects whose size we know, the Moon appears to be huge (see ILLUSION). See also ECLIPSE; LUNAR THEORY; METONIC CYCLE; MOON, Blue.

FERGUS J. WOOD,

Science Editor, *The Encyclopedia Americana*.

MOON, Blue, a comparatively rare phenomenon of meteorological optics, which in its infrequency and seeming improbability of occurrence is undoubtedly responsible for the commonly heard expression "once in a blue moon."

During the occurrence of this phenomenon, well documented in scientific literature, the entire illuminated portion of the Moon, normally white or yellowish against its sky surroundings, acquires a distinct blue tone, substantially darker than the blueness imparted to the dark-patch lunar "seas" by atmospheric suffusion in dry, cerulean skies of daylight. That portion of the atmosphere illuminated by the Moon likewise takes on a steel blue appearance, quite distinct from the violet hues of late twilight or auroral radiation of the night sky.

The phenomenon has been observed at all seasons of the year, and in a variety of latitudes and longitudes. Several cases have been observed in perfectly clear skies on the high seas, hundreds of miles from land. It has been observed to recur on two nights in succession. Whether seen, as variously reported, through a thin veil of transient high clouds colored red by the Sun below the horizon, or after their passage, in clear sky, the azure appearance of the Moon remains unchanged. In a persistence of several hours, it has sometimes been seen to exhibit a slow progression up the chromatic scale from blue to green, and both the Moon and the Sun have also been witnessed in green light alone.

The occurrence of the blue-green coloration can be reduced to a phenomenon of colloidal dimensions (see COLLOID CHEMISTRY), resulting from the presence in the atmosphere of numerous extremely minute, suspended particles (aerosols), individually too small to be seen, yet collectively having a sensible effect on transmitted light rays.

Case 1 (Large Particle Scattering).—This more general case involves the phenomenon of a blue moon or sun caused by the presence in the atmosphere of colloidal particles larger than the wavelength of the incident light, with resultant diffraction and preferential scattering of red rays, and transmission of blue. Large particle scattering, whose theory has been established by Gustav Mie and by Augustin Boutaric, is exactly the op-

posite of Rayleigh (small particle) scattering, in which the particles are comparable in size with the wavelength of the incident light (see LIGHT).

Rayleigh scattering results in the blue of the sky, blue haze, and blue smoke from burning leaves, through deep optical layers of which the setting Sun is seen as orange or red by transmitted light. Since the scattered blue light (Tyndall effect) by which these layers are seen is structural rather than body color, the image of a light source under these more usual conditions must be of complementary, or reddish hue.

Conversely, in large particle scattering, the scattered light is red, and the transmitted light is blue. In the atmosphere, strong turbulence is required to support these larger particles in free suspension against the action of gravity, else the particles will coalesce and precipitate out. Therefore, this case is uncommon except in instances of strong vertical currents (at least initially) to carry the particles upward. These currents are provided by the heat associated with forest fires and volcanoes.

Actual visible proof of the selective absorption properties of volcanic dust for red light was provided by an observation made by Edward Whymper during a minor eruption of Mt. Cotopaxi in the Andes of Ecuador in 1880. As the visible cloud of volcanic dust poured upward and outward and passed over the Sun, a green disc was seen, which subsequently changed to reddish hues as the larger particles coalesced into group aggregates and fell out, leaving only finely dispersed blue-scattering particles.

Numerous examples of highly colored atmospheric phenomena also occurred during and after the eruption of Krakatau on Aug. 27, 1883, and were seen at points around the world. Cases of blue suns, blue moons, and even colored stars were reported. Under the force of the explosion, volcanic dust was diffused to great heights and, carried by the prevailing winds of these levels, was distributed widely.

Such volcanic ejecta of dust and powdered pumice provide excellent light-scattering media of large particle size. Other common sources exist in desert sandstorms of the harmattan type (see WINDS), in loess-bearing winds, in smoke from forest fires; and, to a more limited extent, in dust from blasting operations, and even the burst of exploding shells. These larger particles are all classified colloiddally as dusts (particle size greater than 10^{-3} centimeter in diameter).

Particles of smoke from forest fires and volcanic dust may be carried to very high levels, where they become invisible from the ground. Carried by strong winds aloft, the particles travel far. On Sept. 27, 1950, thousands of people in England, Scotland, and Denmark were startled to see both a blue moon and blue sun in the sky within a 24-hour period, caused by uncontrolled forest fires in Alberta, Canada, 4,500 miles away.

Related laboratory examples of Case 1 in fluid media are to be found in colloidal suspensions of sulphur, silver, and certain dispersions of gold, all of which under controlled conditions and in certain stages of agglomeration may be made to transmit blue light alone.

Case 2 (Pressurized Aqueous Vapor).—Of much less importance in nature, this case includes the phenomenon of blue images of light sources observed through clouds of steam, issuing under high pressure from jets, and mixed with sand, dust, or other solid particles. The phenomenon is es-

essentially one of laboratory demonstration, yet blue and green suns have been reported as seen in nature over exhausts and safety valves of steamboats, railroad steam engines, and the like. A wide range of green and blue colors may be created in laboratory by varying the proportions of dust. See also DUST; VOLCANO.

FERGUS J. WOOD,
Science Editor, *The Encyclopedia Americana*.

MOON, Mountains of the, Africa, a mythical chain of mountains designated by Ptolemy as containing the sources of the Nile and extending across the broadest part of Africa from Cape Guardafui, on the Indian Ocean, to the Bight of Benin, on the Atlantic Ocean. They are often identified with the Ruwenzori (q.v.) mountain range.

MOON GODDESS. See MYTHOLOGY—*Man and Nature*.

MOONEY, Edward, American cardinal: b. Mt. Savage, Md., May 9, 1882. He was the youngest of four children born to Thomas and Sarah Heneghan Mooney. In 1887, his parents established their home in Youngstown, Ohio. His classical studies were begun at St. Charles College, Ellicott City, Md., and he studied philosophy at St. Mary's Seminary, Baltimore, Md. In 1905, he entered the North American College, Rome, to begin theological training. Four years later, April 10, 1909, he was ordained by Pietro Cardinal Respighi. Returning to the United States, the future cardinal taught dogmatic theology at St. Mary's Seminary, Cleveland, Ohio. In 1916, he was named first principal of the new Cathedral Latin School which was founded that year by Bishop Farrelly of Cleveland. Before returning to Rome in 1923 to be spiritual director of the North American College, he had served for a few months as pastor of St. Patrick's Church, Youngstown, his home city. On Jan. 8, 1926, he was consecrated archbishop of Irenopolis and appointed apostolic delegate to India by Pius XI. He served in India until Feb. 25, 1931, when he was directed by the same pope to fill a similar office in Japan. His appointment to govern the see of Rochester, N. Y., came in August 1933, and in May 1937, he was named first archbishop of Detroit, Mich. In February 1946, he returned to Rome where on February 21 he was elevated to membership in the Sacred College of Cardinals by Pius XII. Cardinal Mooney's extraordinary talents for leadership and organization were recognized by the whole Catholic hierarchy in the United States by his election in 1935 as chairman of the administrative board of the National Cath-

olic Welfare Conference. In this position, the cardinal became known nationally as a champion of justice in labor relations, a defender of the rights of Poland and of all despoiled nations, and an ardent advocate for persecuted racial minorities. Cardinal Mooney was blessed with an amiable disposition. He makes friends easily. His mind may be best described as keenly analytical. Always a student and a methodical worker, he could ever make others enjoy joining him in the most arduous labor. One of his secretaries who worked with him in the Far East once remarked, "I would gladly sweep the streets if he asked me to do it."

LEO DEBARRY,
Diocesan Director of the Society for the Propagation of the Faith, Detroit.

MOONEY, James, American ethnologist: b. Richmond, Ind., Feb. 10, 1861; d. Dec. 22, 1921. He was educated in the public schools and began his career as a teacher. In 1879, he engaged in journalism and, in 1885, began his connection with the Bureau of American Ethnology, Washington, D.C., which lasted until his death.

MOONEYE, a fish of the small family Hiodontidae, related to the herrings and sometimes called toothed herrings. They inhabit the rivers and lakes of the interior of North America, and are silvery, large-eyed fish, 8 to 12 inches long, extraordinarily well supplied with teeth, and voracious.

The mooneye cisco is a small whitefish (*Argyrosomus* or *Leucichthys hoyi*), related to the lake herring. See also WHITEFISHES.

MOONFISH, any of the compressed ovate highly silvery fishes of the family Carangidae, genera *Selene* and *Vomer*, including small tropical forms allied to the pompanos. One greenish species (*Vomer scipinnis*) is well known in New York Bay and markets as a pan fish, sometimes called blunt-nosed shiner. More widely recognized is the horsehead (*Selene vomer*), which reaches a length of more than a foot, and is regarded along the south Atlantic coast as one of the best of food fishes; it also occurs along the western coast of Mexico and Central America, as do certain other species.

MOONLIGHT SONATA, a term used popularly in Germany and England for the Beethoven *Sonata quasi una Fantasia* in C sharp minor (1801). The term arose from the critic Heinrich F. L. Rellstab (1799-1860) comparing the first movement to a boat gliding by moonlight on Lake Lucerne.

MOONRAT or **RAFFLE'S GYMNU-RUS** (*Echinosorex gymnurus*), a member of the hedgehog family (Erinaceidae) and largest living species of the mammalian order Insectivora (q.v.). It is found in the Malay States, Tenasserim, lower Thailand, Sumatra, and Borneo. Anatomically, it is one of the most primitive and generalized of modern mammals. The fur is thick, coarse, black, with a mixture of whitish hairs on upper back, shoulders, and head. Length, from tip of long pointed, shrew-like snout to base of tail averages about 16 inches; the bare, scaly tail is about 9½ inches long. There are five toes on each limb. The moonrat is nocturnal and feeds on insects, grubs, and small animals in general.

Other names for the animal include "white shrew" and, in Malayan, *Ticus bulan*. See also **HEDGEHOG**.

MOONSEED, a woody vine of the genera *Menispermum* and *Cocculus* of the family Menispermaceae. The Carolina moonseed is native in southeastern United States.

MOONSTONE. A translucent or transparent variety of the mineral feldspar (orthoclase, albite, or labradorite) which exhibits a delicate pearly opalescent play of colors. Used as a gem.

MOONWORT. See **BOTRYCHIUM**.

MOORCROFT, William, English veterinary surgeon and traveler: b. Lancashire, England, about 1765; d. Andekhui, Afghan Turkestan, Aug. 27, 1825. He studied veterinary science in France, settled in London, and made a fortune which he lost in patents, and then became veterinary surgeon (1808) to the Bengal Army. He crossed the Himalayas, explored (1811-1812) the sources of the Sutlej and Indus rivers, explored (1819-1822) Lahore and Kashmir, visited Bukhara in 1825, and died at Andekhui.

MOORE, mōor; mōr, Addison Webster, American professor of philosophy: b. Plainfield, Ind., July 30, 1866; d. London, England, Aug. 25, 1930. He was graduated at De Pauw University in 1890, taking his M.A. in 1893; Ph.D., Chicago University, 1898. He served in the University of Chicago as assistant in philosophy (1895-1897), associate (1897-1898), instructor (1898-1902), assistant professor (1902-1904), associate professor (1904-1909), and professor (1909). He lectured on philosophy at Harvard in 1918. Among his works are *Existence, Meaning and Reality* (1903), and *Pragmatism and Its Critics* (1910). He was president of the Western Philosophical Association in 1911 and of the American Philosophical Association in 1917, and he was associate author of *Creative Intelligence* (1916).

MOORE, Alfred, American jurist, son of Maurice Moore (q.v.): b. New Hanover County, N. C., May 21, 1755; d. Bladen County, Oct. 15, 1810. At 20 he became captain in a regiment of North Carolina troops, but was soon afterward obliged to resign in order to provide for his destitute relatives. When the British seized Wilmington (1781), he raised a troop of volunteers, with whom he rendered great service to the American cause. In order to alleviate the distress to which his patriotism had reduced him, the general assembly in 1782 made him attorney general. He had been licensed to practice law in 1775, and he soon attained, by hard study, a foremost rank in his profession. He was raised to the bench in 1798 and became associate justice of the Supreme Court of the United States in 1799. He resigned in 1804.

MOORE, Benjamin, American Protestant Episcopal clergyman: b. Newtown, Long Island, N. Y., Oct. 5, 1748; d. New York City, Feb. 27, 1816. He was graduated at King's (now Columbia) College in 1768, studied theology, and in May 1774 went to England to obtain orders and, in June of the same year, was ordained deacon and priest. On his return to New York he

became an assistant minister of Trinity Church and succeeded to the rectorship in December 1801. In 1801 he was consecrated bishop of New York. He was also president and professor of logic Columbia College.

MOORE, Charles Herbert, American artist: b. New York City, April 10, 1840; d. Hampshire, England, Feb. 15, 1930. He was educated in the public schools of New York City. In 1871 he became instructor in art in the Lawrence Scientific School at Harvard University. Three years later he began his career of teaching the fine arts to the Harvard undergraduates. He was made professor in 1896, a position he held until his retirement in 1909. He was curator and later director of the Fogg Art Museum (1896-1909). He published *The Development and Character of Gothic Architecture; Examples for Elementary Practice in Delineation; Character of Renaissance Architecture; Swedenborg's Servant of God; and Mediaeval Church Architecture of England*.

MOORE, Charles Leonard, American poet and essayist: b. Philadelphia, Pa., March 10, 1854; deceased. He was educated in the schools of his native city. In 1878-1879 he was one of the managers of the Madeira and Mamore Railroad Construction Company and was United States consular agent at San Antonio, Brazil, the headquarters of that operation. He was afterward engaged in railroad construction in Pennsylvania. He was then secretary of one of the Disston Florida Sand companies for four years. During the next 20 years he was occupied with literary work. He was a constant contributor to *The Dial* during that time. He published *Life* (1881); *Poems Antique and Modern* (1883); *Book of Day Dreams* (1887); *Banquet of Palaces* (1889); *Odes* (1896); *Ghost of Rosalys* (1900); *The Red Branch Crests—a Trilogy* (1904); *Incense and Iconoclasm* (1915); and *Idols and Ideals* (1919).

MOORE, Clarence Bloomfield, American archaeologist: b. Philadelphia, Pa., Jan. 14, 1852; d. 1936. He was graduated at Harvard (1873), then traveled through most of Europe, Asia, and Egypt. He crossed the Andes and traveled down the Amazon (1876) and made a journey around the world (1878-1879). He spent more than 20 years exploring the Indian mounds of South Carolina, Georgia, Florida, Alabama, Mississippi and Louisiana.

MOORE, Clement Clarke, American educator and poet: b. New York City, July 15, 1779; d. Newport, R.I., July 10, 1863. He was a son of Benjamin Moore (q.v.); was graduated at Columbia College in 1798; in 1823 became professor of Oriental and Greek literature at the General Theological Seminary, New York, and retired from that position in 1850. He gave to the seminary the ground on which it stands. A collection of *Poems* which he published in 1844 included *A Visit from Saint Nicholas*, better known under another title—*'Twas the Night Before Christmas*—which has long had great popularity with grown people as well as with children. Written in 1822 for his own children these verses were printed anonymously and without Moore's knowledge in the *Troy Sentinel*, Dec. 23, 1823. He also compiled *A Compendium*

Lexicon of the Hebrew Language (1809) and wrote *George Castriot, Surnamed Scanderbeg, King of Albania* (1850).

MOORE, Clifford Herschel, American Latin professor: b. Sudbury, Mass., March 11, 1866; d. Cambridge, Mass., Aug. 31, 1931. He was graduated (1889) at Harvard University and received the Ph.D. degree (1897) at the University of Munich. He was classical master (1889-1892) at the Belmont School for Boys, Belmont, Calif., professor of Greek (1892-1894) at Phillips Academy, Andover, Mass., instructor (1894-1895), then assistant professor of Latin (1895-1898) at the University of Chicago. He then joined the faculty of Harvard University, and was assistant professor of Greek and Latin (1898-1905); professor of Latin thereafter, and dean of the faculty of arts and sciences after 1925. In 1905-1906 he was professor of Latin at the American School of Classical Studies in Rome. He edited *Frederic De Forest Allen's Medea of Euripides* (1899); *Horace's Odes and Epodes* (1902); and published *The Religious Thought of the Greeks* . . . (1916, 2d ed. 1925); *Pagan Ideas of Immortality* (1918); also numerous articles on classical philology and the history of religion.

MOORE, David Hastings, American Methodist Episcopal bishop: b. Athens, Ohio, Sept. 4, 1838; d. Cincinnati, Nov. 23, 1915. He was graduated from the Ohio University in 1860 and ordained to the ministry in that year, but entered the Union Army at the outbreak of the Civil War, remaining in it till the close of the war and attaining the rank of lieutenant colonel. He was president of the Cincinnati Wesleyan Female College (1875-1880) and of the Colorado Seminary, and chancellor of the University of Denver (1880-1889). He was elected bishop in 1900 and had his episcopal residence during the three ensuing quadrennial periods in Shanghai, China, Portland, Oreg., and Cincinnati, Ohio. He retired in 1912.

MOORE, Edward, English Dante scholar: b. Cardiff, Wales, Feb. 28, 1835; d. Chagford, Devon, Eng., Sept. 2, 1916. He was educated at Pembroke College, Oxford, where he received high honors and became honorary fellow, and was principal of St. Edmund Hall, 1864-1913 and a canon of Canterbury from 1903. He is favorably known for his studies of Dante, and published *The Time References in the 'Divina Commedia'* (1887; rev. in Italian, 1900); *Contributions to the Textual Criticism of the 'Divina Commedia'* (1889); *Dante and His Early Biographers* (1890); the *Oxford Dante* (complete in one volume, 1894); and *Studies in Dante* (3 series: 1896, 1899, 1903).

MOORE, Edward, English playwright: b. Abingdon, Berkshire, England, March 22, 1712; d. Lambeth, March 1, 1757. He was, by trade, a linen draper but failed in business and took up literature. His first work was *Fables for the Female Sex* (1744), and in 1748 his *Trial of Selim the Persian* and *The Foundling* were published. He owed, no doubt, some of his success in the literary world to such prominent patrons as George Lyttelton, 1st Baron Lyttelton, and Henry Pelham. His *Gil Blas* was published in 1751 and *The Gamester* in 1753, David Garrick

probably assisting him in the work. From 1753-1757 he was editor of *The World*, a satirical periodical. A collection of his works under title of *Poems, Fables and Plays* was published in 1756.

MOORE, Edward Caldwell, American theologian: b. West Chester, Pa., Sept. 1, 1857; d. Cambridge, Mass., March 26, 1943. He was graduated (1877) at Marietta College, then at Union Theological Seminary (1884). He studied (1884-1886) at the universities of Berlin, Göttingen, and Giessen, then received (1891) the Ph.D. degree at Brown University. In 1884 he was ordained to the Presbyterian ministry and served as pastor at Yonkers, N. Y. (1886-1889), and Central Congregational Church, Providence, R. I. (1889-1901). In the latter year he became Parkman professor of theology at Harvard University, and in 1915 became also Plummer professor of Christian morals in the same institution. After 1905 he was university preacher and chairman of the board of preachers at Harvard. He was lecturer at Mansfield College, Oxford, England, 1894 and 1914; at Andover Theological Seminary, 1900; at Lowell Institute, 1903; and at Yale Divinity School, 1906. He published *The New Testament in the Christian Church* (1904); *History of Christian Thought Since Kant* (1912); *The Spread of Christianity in the Modern World* (1919); *West and East* (1919); and *The Nature of Religion* (1936).

MOORE, Edward Mott, American surgeon: b. Rahway, N. J., July 15, 1814; d. Rochester, N. Y., March 3, 1902. He studied medicine in New York and Philadelphia and was graduated (1838) as M.D. at the University of Pennsylvania. He settled in Rochester in 1840. In 1842 he received a call to the chair of surgery at the Vermont Medical College in Woodstock, Vt., where he lectured for 11 years. He served then successively at Berkshire Medical College, Pittsfield, Mass. (1853-1854); Starling Medical College, Columbus, Ohio (1854-1855); then went (1858) to Buffalo Medical College, serving in the same capacity until 1882. His greatest work was done in research and experiments on the heart's action. He was president of the New York State Medical Society; a founder of the American Surgical Association, succeeding Dr. Samuel D. Gross (1883) as its president; and was president of the American Medical Association (1889-1890).

MOORE, Eliakim Hastings, American mathematician: b. Marietta, Ohio, Jan. 26, 1862; d. Chicago, Ill., Dec. 30, 1932. He was graduated (1883) at Yale, receiving the Ph.D. degree in 1885. He then studied at Berlin (1885-1886) and was appointed tutor in mathematics at Yale (1887-1889), becoming assistant professor (1889-1891) at Northwestern University and associate professor (1891-1892). In 1892 he was made professor of mathematics at the University of Chicago, becoming head of the department from 1896-1931. He edited *Transactions of the American Mathematical Society* (1899-1907) and was associate editor of the *Proceedings of the National Academy of Sciences* after 1915. His articles appeared in many mathematical periodicals.

MOORE, Frank Frankfort, British novelist and dramatist: b. Limerick, Ireland, May 15,

1855; d. 11 May 1931. He was educated at the Royal Academical Institution, Belfast, traveled extensively in Africa, India and South America and in 1876-92 was art editor of the *Belfast News Letter*. Thereafter he lived in London. His later works include 'Nell Gwyn' (1900); 'The Other World' (1904); 'The King's Messenger' (1907); 'Life of Goldsmith' (1910); 'The Commonsense Collection' (1911); 'The Marriage of Barbara' (1912); 'Fanny's First Novel' (1913); 'The Land of the Reef' (1915); 'The Rise of Raymond' (1916); 'The Fall of Raymond' (1917); 'The Courtship of Prince Charming' (1920). His plays include 'A March Hare' (1877); 'Broken Fetters' (1881); 'Forgotten' (1889); 'The Queen's Room' (1891); 'The Mayflower' (1892); 'Oliver Goldsmith' (1892); 'Kitty Clive, Actress' (1895).

MOORE, Frank Gardner, American educator: b. West Chester, Pa., 25 Sept. 1865. He was graduated (1886) at Yale, receiving the Ph.D. diploma in 1890. He studied (1890-91) at the University of Berlin, and was tutor in Latin at Yale, 1888-93; assistant professor of Latin, 1893-1900, and associate professor of Latin and Roman archaeology at Dartmouth College, 1900-08; professor of Latin at Trinity College, Hartford, Conn., 1908-10. He then joined the faculty of Columbia University as professor of classical philology, and in 1919 was made professor of Latin. He was secretary of the American Philological Association, 1904-16; president, 1917. In 1918 he was chairman of Local Exemption Board, 135. He edited Cicero's 'Cato Major' (1904); Tacitus' 'Histories I and II' (1910); 'Orations of Cicero' (1925).

MOORE, George, English author: b. Ireland, 1853. He studied art in London under Luyten, but completed his education in France and became thoroughly imbued with a Gallic spirit. Apart from a few contributions to periodicals, his first literary work was contained in two volumes of quasi-French verse, 'Flowers of Passion' (1877) and 'Pagan Poems' (1881). With his entry into fiction he allied himself immediately with the French realistic or naturalistic school, as may be seen in 'A Mummer's Wife' (1884), a story of the degeneration of a clerk's wife, her elopement with a strolling player, and the sufficiently squalid sequel; in 'Mike Fletcher' (1891), in which a gay young Irishman wins a fortune by his wits and his social success, and then swings from his riotous living to remorse and back again, only to commit suicide at the end; or in 'Esther Waters' (1894), a detailed sketch of life among the servant class and in a country inn, the theme being the allurements of gambling. 'Evelyn Innes' (1898) and its sequel, 'Sister Teresa' (1901), are a keen analysis of a musical and sensuous temperament under the successive influence of social temptation and of convent life. What he exemplified in these novels he stated abstractly but over-eagerly and passionately in 'Confessions of a Young Man' (1888) and 'Impressions and Opinions' (1890), both urging the dead level of mediocrity or worse in English literature of the day as contrasted with French. His desire to found an English 'Theatre Libre' and his growing conviction that the English stage and English novel were far gone led him to assist in founding the Irish Literary Theatre in Dublin and to

take a prominent part in the movement styled the Irish Renaissance, a movement of which his 'Bending of the Bough' (1900) is one of the most promising dramatic productions and ranking above 'The Strike at Arlingford' (1893). His later works include 'The Untilled Field' (1903); 'The Lake' (1905); 'Memoirs of My Dead Life,' which purports to be autobiographical; the autobiographical 'Hail and Farewell' (3 vols., New York 1911-14); 'The Brook Kerith' (1916); 'Palestine in the Time of Christ'; 'A Storyteller's Holiday' (1921); 'Heloise and Abelard' (1921); 'In Single Strictness' (1922); 'Anthology of Pure Poetry' (1925); 'Ulick and Soracha' (1926). D. London 21 Jan. 1933.

MOORE, George Foot, American Orientalist: b. West Chester, Pa., 15 Oct. 1851; d. Cambridge, Mass., 16 May 1931. He was graduated at Yale in 1872 and at Union Theological Seminary in 1877. He was pastor of the Putnam Presbyterian Church, Zanesville, Ohio, 1878-83, and in the latter year became Hitchcock professor of Hebrew and the history of religions at Andover Theological Seminary, and from 1899 to 1901 was president of the faculty there. In 1902 he was appointed professor of theology at Harvard and in 1904 Frothingham professor of the history of religions. For some years he edited the 'Journal of the American Oriental Society,' of which he was president 1911-12. He published 'A Commentary on Judges' (1895); 'The Book of Judges,' a translation with notes for the Polychrome Bible (1898); and 'The Book of Judges in Hebrew' (1900); 'The Literature of the Old Testament' (1913); 'History of Religions' (Vol. I. 1913; rev. ed. 1920; Vol. II. 1919); and 'Judaism' (2 vols. 1927).

MOORE, George Henry, American historical writer: b. Concord, N. H., 20 April 1823; d. New York, 5 May 1892. In 1839 he removed to New York and was graduated at the University of the City of New York (now New York University) in 1843. As assistant to his father, Jacob Bailey Moore (q.v.), librarian of the New York Historical Society, he had been long connected with that institution when, in 1849, he succeeded to his father's position, which he held until 1872, and then became first superintendent of the Lenox Library. This office he retained until his death. His contributions to the proceedings of historical societies and to historical magazines were numerous. He also published 'The Treason of Charles Lee' (1858); 'The Employment of Negroes in the Revolutionary Army' (1862); 'Notes on the History of Slavery in Massachusetts' (1866); and 'A History of the Jurisprudence of New York' (1872).

MOORE, George Thomas, American botanist: b. Indianapolis, 23 Feb. 1871. He was educated at Wabash College and graduated A.B. at Harvard (1895), A.M. 1896 and Ph.D. 1900. He was appointed assistant in cryptogamic botany at Harvard and teacher at Radcliffe College. From 1899-1901 he had charge of the botany department at Dartmouth College and was (1903-05) physiologist and algologist at the Bureau of Plant Industry, Department of Agriculture. He had charge of botany at the Marine Biological Laboratory at Woods Hole, Mass., and became professor of applied botany and plant physiology at Shaw School

MOORE, Harry Humphrey, American botanist: b. New York, 1844; d. Paris, France, 2 Jan. 1926. He studied under Gérôme at Paris and Fortuny in Madrid, and made painting tours through Germany, Italy and Japan. He devoted himself to such genre pictures as his two masters excelled in, and his best-known works are 'Gypsy Encampment, Granada'; 'Moorish Water-Carrier'; 'Almeh'; 'The Blind Guitar-Player'; and 'A Moorish Beggar.' He was deaf and dumb.

MOORE, Sir Henry, English colonial governor: b. Vere, Jamaica, 1713; d. 1769. In 1760 he became lieutenant-governor of the island, and until 1762 was practically in control of its affairs. He suppressed the slave insurrection of 1760, and for that service was rewarded with a baronetcy. Appointed governor of New York in July 1765, he reached there at the outbreak of the Stamp Act excitement. Public opinion was strongly pronounced against the act, and Moore, yielding to the demands of the colonists, suspended its enforcement. He remained governor until his death.

MOORE, Henry, Irish Wesleyan clergyman: b. near Dublin, 1751; d. 1844. After conversion, he joined a Methodist class in 1777, began to preach, gave up his trade of wood-carver, opened a school, and in 1779 was appointed by Wesley to the Londonderry circuit. Called later to London, he assisted Wesley (1784-86) as traveling companion and amanuensis, serving again in the same capacities 1788-90. Wesley appointed him one of his three literary executors, and also selected him to become (after Wesley's death) one of 12 ministers in charge of services at the City Road Chapel, London. In 1804, and again in 1823, Moore was president of the Wesleyan Conference. Refusing ordination in the Church of England, he was ordained by Wesley, with two Episcopal clergymen assisting. The proposal to establish a hierarchy in the Methodist Church was opposed by Moore, who also objected to the scheme for establishing a Methodist theological school, and to the proposed acquisition of land by the Methodist body in 1839, when the centenary fund was created. In 1792, with Thomas Coke, he published a *Life of the Rev. John Wesley*. Although the work was authorized by the Conference, the third literary executor prevented them from using Wesley's papers in its preparation. With the aid of these he wrote a new 'Life,' which was published in 1824-25. Moore also wrote 'A Reply to Considerations on the Separation of the Methodists from the Established Church' (1794); 'Thoughts on the Eternal Sonship' (1816); two religious biographies: 'Sermons,' with an autobiography (1830). Consult 'Life' with the autobiography by Mrs. Richard

MOORE, Jacob Bailey, American journalist and author: b. Andover, N. H., 31 Oct. 1797; d. Bellows Falls, Vt., 1 Sept. 1853. He learned the printer's trade on the *Concord Patriot*, became bookseller and publisher, then partner in the above paper. In 1826 he founded the *New Hampshire Statesman* to aid the election of John Quincy Adams as President, and became (1828) member of the State legislature and, in the same year, sheriff of Merrimac County (1828-33). In 1839 he edited the *New Hampshire Journal*, but soon moved to New York to edit the *Daily Whig*. He was government clerk in the Washington post office (1841-45), then librarian of the New York Historical Society (1845-49), when he moved to San Francisco as its postmaster (1849-53). He collaborated in compiling a topographical, historical and biographical work on New Hampshire (Concord 1822-24), and he published 'A Gazetteer of the State of New Hampshire' (1823); and histories of Concord and of Andover, N. H., and 'Memoirs of American Governors' (1846).

MOORE, James, American colonial governor: b. probably in Ireland about 1640; d. Charleston, 1706. He is supposed to have been a son of the Irish rebel, Roger Moore, and to have come to this country about 1665. Settling in South Carolina, he became a leader among those who openly resisted the lords proprietors in their oppressive demands. In 1682 he was made a member of the governor's council, and in 1692 was sent to the Assembly. In the latter year the proprietors named him for exclusion from their pardon. Two years later he was again one of the governor's council; that body in 1700 elected him governor; and he filled the executive office until 1703, when Sir Nathaniel Johnson arrived. Appointed by the Assembly to lead an expedition for the capture of Saint Augustine (1702). Moore took the town without difficulty, but failed to reduce the fort. Under Governor Johnson he served as attorney-general, and was successful in an expedition (1703) against the Apalachee (q.v.). Consult McCrady, 'History of South Carolina Under the Proprietary Government' (1897).

MOORE, James, American colonial officer: b. Charleston, S. C., 1667; d. 17 Feb. 1723. He was a son of the James Moore preceding, in whose expeditions against the Indians he participated. In 1713 Governor Craven appointed him commander of the forces sent to aid the North Carolina colony against the Tuscarora Indians, and two years later served as lieutenant-general of an expedition sent to subdue the Yamasi. In 1719, when Gov. Robert Johnston was deposed, the Convention having made an end of the proprietary government, Moore became governor. He was succeeded in 1721 by Francis Nicholson, who was commissioned by the English crown, afterward becoming speaker of the assembly.

MOORE, James Hobart, American lawyer and promoter: b. Berkshire, N. Y., 14 June 1852; d. 8 July 1916. He was bank clerk (1871-73) at Binghamton, N. Y., went to Chicago (1873) and was admitted to the Illinois bar (1881). In collaboration with his brother, William H. (q.v.), he created the great "Moore group" of four great corporations which

together had a capitalization of \$187,000,000, these since being incorporated in the United States Steel Corporation. They were also the promoters of the National Biscuit Company, and other mercantile amalgamations. He was a director of the American Can Company, American Tin Plate Company, and numerous other leading industrial corporations.

MOORE, John, Scottish physician and author: b. Stirling, December 1729; d. Richmond, Surrey, 21 Jan 1802. Having obtained a knowledge of medicine and surgery he went to the Netherlands in 1747, and served as a surgeon's mate in the military hospitals. Returning to Scotland he practised till 1772. In that year he became medical attendant to the ninth Duke of Hamilton, whom he accompanied on a five-year tour on the Continent. In 1779 he published 'A View of Society and Manners in France, Switzerland and Germany,' which passed through numerous editions, and has been translated into several foreign languages. In 1781 appeared his 'View of Society and Manners in Italy'; and in 1786 'Medical Sketches,' followed by 'Zeluco,' a novel (1786); 'A View of the Causes and Progress of the French Revolution' (1795); and two other novels, which were not so successful as his first.

MOORE, Sir John, British soldier, son of the preceding: b. Glasgow, Scotland, 13 Nov. 1761; d. Spain, 16 Jan. 1809. He served in Nova Scotia during the American Revolutionary War; from 1784-90 was member of Parliament for a group of Scottish burghs; served in Cordica, the West Indies (1795), in Ireland during the rebellion of 1798, in Holland in 1799 and in Egypt in 1800-01. He was created Knight of the Bath in 1804 and was in command in the Mediterranean (1806-08). He was appointed commander-in-chief of the British army in Portugal in 1808. His intention was to cut the French communications with Madrid, but struggling against the apathy of the Spaniards and intrigue among his own countrymen, he advanced to Salamanca in spite of the gravest difficulties, but was ultimately forced to make a midwinter march to Coruna, a distance of 250 miles, through a desolate and mountainous country, rendered almost impassable by snow and rain, and constantly harassed by the enemy who outnumbered him by three to one. His troops arrived at Coruna in a distressing condition; Soult was ready to attack him as soon as he began the work of embarkation, and in the battle that followed Moore fell, mortally wounded, in the hour of victory. Wolfe's celebrated poem, 'The Burial of Sir John Moore,' keeps his memory green. Consult Carrick Moore, 'Life of Sir John Moore' (1835), and his 'Diary' (ed. by Maurice 1904).

MOORE, John Bassett, American lawyer, diplomatist and author: b. Smyrna, Del., 3 Dec. 1860. He attended private schools and was graduated at the University of Virginia in 1880. He read law in the office of Edward G. Bradford, now United States district judge at Wilmington, Del., and was admitted to the bar there in 1883. In 1885 he passed the first civil service examination for admission to the Department of State, at Washington, and was appointed a law clerk in that department in July of that year. In August 1886 he was appointed Third Assistant Secretary of State. In the

summer of 1887, he acted as secretary to the conference between the Secretary of State and the British and German ministers on the affairs of Samoa; and in the winter of 1887-88 he acted as American Secretary in the conference on the North Atlantic Fisheries. He assisted at the organization of the First International American Conference at Washington, and later made a report to the conference on the subject of extradition. In 1891 he resigned the post of Third Assistant Secretary in order to take the newly-created chair of International Law and Diplomacy at Columbia University, New York, a chair which he has since continued to hold. In April 1893, on the outbreak of the war with Spain, he was without solicitation appointed by President McKinley to the position of Assistant Secretary of State. This position, which he had on three previous occasions declined, he resigned in September of the same year, in order to accompany the American Peace Commission to Paris as Secretary and Counsel, in which capacity he took part in the negotiation of the Treaty of Peace with Spain. In 1904 he acted as agent of the United States before the United States and Dominican Arbitration Tribunal. He was a member of the delegation of the United States in the Fourth International American Conference, at Buenos Aires, in 1910, and afterward served as a special plenipotentiary to the Chilean Centenary. In 1912 he was appointed the delegate of the United States on the International Commission of Jurists, which was organized at Rio de Janeiro in that year, under the Pan-American Treaty of 1906, for the codification of International Law. In March 1913 he became appointment of President Taft a member of the Permanent Court of Arbitration at The Hague. In the following month he was appointed by President Wilson counselor for the Department of State and was invested with authority to sign as acting Secretary of State. He resigned as counselor in March 1914. In 1921 he was appointed a member of the Permanent Court of International Justice. Mr. Moore is a member of the Institut de Droit International, of the Institut Colonial International, of the American Philosophical Society, of the American Political Science Association, of which he was president in 1913-14, and of various other learned societies. He is a member and honorary secretary of the Hispanic Society of America; and an honorary member of the College of Lawyers at Costa Rica. He was a member of the Pan-American Financial Congress at Washington in May 1915, acting as chairman of the committee on uniform laws, by which the scheme of work of the Congress was drawn up; and he is vice-chairman of the American section of the International High Commission organized to carry out the plans of the Congress. He was a delegate of Columbia University and of various learned societies in the Second Pan-American Scientific Society at Washington, December 1915-January 1916. He is vice-president of the Pan-American Society of America. He is an incorporator of the American National Red Cross and active on its committees. He was delegate to and president of the International Conference, The Hague, 1922-23, on Rules for Aircraft and Radio in Time of War. His publications include 'Report on Extraterritorial Crime' (Washington 1887); 'Report on Ex-

tradition' (Washington 1890); 'Extradition and Interstate Rendition' (2 vols., Boston 1891); 'American Notes on the Conflict of Laws' (Boston 1896); 'History and Digest of International Arbitrations' (6 vols., Washington 1898); 'American Diplomacy, its Spirit and Achievements' (New York 1905); 'A Digest of International Law' (8 vols., Washington 1906); 'The Works of James Buchanan' (12 vols., Philadelphia 1908); 'Four Phases of American Development: Federalism, Democracy, Imperialism, Expansion' (Baltimore 1912); 'Principles of American Diplomacy' (1918). He is an editor of the *Political Science Quarterly*, of the *Journal du Droit International Privé*, etc.

MOORE, John White, American naval officer: b. Plattsburg, N. Y., 24 May 1832; † 1913. He was educated at Plattsburg Academy, Williston Seminary and under private tuition at New York City. He was appointed (1853) third assistant engineer, United States navy, promoted (1855) to second assistant engineer, becoming (1894) chief engineer. For valuable service in the Civil War he was created (1906) rear-admiral. He originated chain cable protection on sides of wooden vessels and of 'fighting tops,' now in general use. After being in action with the West Gulf Blockading squadron and the lower Mississippi River, engaging rebel batteries at head of passes and at defense of Pensacola (1861), passage and capture of forts Jackson and Saint Philip, capture of New Orleans and Port Hudson (1863), etc., he became superintendent of ironclads at New York and Boston (1863-67) and served at various navy yards. He was fleet engineer (1867-68) on staff of Admiral Farragut, European squadron, and fleet engineer of Asiatic station (1872-75). He retired in 1894 with the rank of commodore, serving, however, as inspector of the New York navy yard during the Spanish American War.

MOORE, Maurice, American patriot and jurist: b. Brunswick County, N. C., 1735; d. 1777. Having studied for the bar, he acquired a high reputation as a lawyer, was one of the three colonial judges of North Carolina at the time of the Revolution, was a member of the provincial congresses at Hillsborough in 1775 and Halifax in 1776 and had a prominent part in framing the constitution of North Carolina. He was one of a committee appointed at the commencement of the Revolution to draw up an address to the people of Great Britain on the wrongs of the North American colonies. His letter to Governor Tryon, under the signature of "Atticus," is an incisive piece of work.

MOORE, Raymond Cecil, American geologist: b. Roslyn, Washington, 20 Feb. 1892. He was graduated from Denison University, Granville, Ohio, in 1913, and taught there 1912-13, when he became a member of the United States Geological Survey. He was also an instructor at the University of Chicago in 1916, and thereafter assistant professor of geology. He was in turn an assistant professor, associate professor and, since 1919, a full professor of geology, at the University of Kansas, and head of the geological department. He is also geologist for the State of Kansas; and was editor of the *Bulletin of the American Association of Petroleum Geologists*, 1920-26. Among the works he has published are: 'Oil and Gas Resources of Kansas' (with

W. P. Haynes, 1917); 'General Geology of Oil and Gas' (1921); 'Geology of Kansas' (1921).

MOORE, Thomas, Irish poet: b. Dublin, 28 May 1779; d. Bromham, near Devizes, 25 Feb. 1852. He was educated at Trinity College, Dublin, with a view of becoming a lawyer, and in 1800 entered as a student at the Middle Temple. In 1800 he published a translation of 'Anacreon' dedicated to the Prince of Wales (his enemy in after years), and in 1801 'The Poetical Works of the late Thomas Little.' His fine musical talent got him admission to the best society. The office of admiralty registrar at Bermuda was bestowed on him in 1803. The post was given to him as a sinecure, and he quitted it after appointing a deputy to perform his duties. In November 1804 after a tour through the United States and British America, he was back again in England. In 1806 he published 'Odes and Epistles,' which contained some attacks on America, and, castigated by Jeffrey in the *Edinburgh Review*, occasioned the memorable frustrated duel between him and the distinguished critic who had no bullet in his pistol. Moore entered in 1807 into an engagement with Power, the music publisher, to produce a series of adaptations to the national Irish airs, he furnishing the words and Sir John Stevenson the music. This great undertaking, which extended over a number of years, only completed in 1834, is the work on which his reputation will mainly rest. Many of the numbers, such as 'The Last Rose of Summer,' and 'Those Evening Bells,' are generally familiar. His 'National Airs' (1815) included 'Oft in the Silly Night' and the 'Sacred Songs' (1816); 'Sound the Loud Timbrel.' In 1811 he married Bessie Dyke, an actress. 'The Twopenny Post Boy, by Thomas Brown the Younger,' a series of satires on the proceedings of the prince-regent and his ministers, appeared in 1812, and by their genuine wit attracted much attention and in this kind of composition he afterward excelled. The same year he removed to Mayfield Cottage, near Ashbourne, Derbyshire, and here his 'Lalla Rookh' was elaborated. Its production was the result of an agreement with Messrs. Longman, by which he was to receive 3,000 guineas for a poem to form a quarto volume. It appeared in 1817, and its success fully justified the liberality of Moore's publishers. It was translated into numerous languages, and attained a European fame. Later criticism has deemed it rather a work, as Garnett says, "of prodigious talent," than of the genius ascribed to it in Moore's own day. The same year appeared a satiric-burlesque poem, 'The Fudge Family in Paris' (1818) in the form of a series of amusing letters supposed to be written by the different members of an excursion party to the Continent. 'Rhymes on the Road' and 'Fables of the Holy Alliance' followed in 1819. About this time he became involved in serious embarrassments by the defalcations of his deputy in Bermuda and found himself suddenly called upon to make up a deficiency of £6,000, ultimately reduced to about £1,000. This vast sum he contrived to clear off by his literary earnings. In 1822 appeared his 'Loves of the Angels'. The 'Life of Sheridan' was produced in 1825, and the 'Epicurean,' a prose romance of small value, in 1827. Next came the justly praised

'Life of Lord Byron' (1830). (See BYRON). His remaining works include the 'History of Ireland' (1846), written for Lardner's 'Cyclopædia' and a task which he found very severe. For nearly the last 30 years of his life he resided at the cottage of Sloperston, near Devizes. Moore's fame, great in his own day, has suffered diminution, except in so far as his songs are concerned, his more ambitious poems being little read. A biography in eight volumes, edited from his journal and correspondence, was published after his death by his friend, Lord John Russell (1853-56). Consult also Clark, J. C. L., 'Tom Moore in Bermuda' (Boston 1909); Gwynn, 'Thomas Moore' (in the 'English Men of Letters' series, London 1905); Gunning, 'Thomas Moore, Poet and Patriot' (ib. 1900); Vallat, 'Thomas Moore sa vie et ses œuvres' (Paris 1887). See LALLA ROOKH.

MOORE, Tom, Canadian labor leader: b. 1878. By trade a carpenter, he became identified with the trade union movement soon after his coming to Canada in 1906. He was at one time business agent for the carpenters' unions in the Niagara district and was general organizer of the United Brotherhood of Carpenters and Joiners of America from 1911 to 1918. He was president of the Trades and Labor Congress of Canada from 1918 to 1935; member of the Industrial Relations Commission in 1919; labor member of the Canadian National Railway Board of Directors 1923-33; member of the governing body of the International Labor Office, Geneva, Switzerland from 1922. He has been member of the Employment and Social Service Commission since 1935 and of the National Employment Commission since 1936. He has advocated progressively improving employer-employee relations through collective agreements between trade unions and employers. He is considered one of the greatest labor leaders of our time.

MOORE, Willis Luther, American meteorologist: b. Scranton, Pa., 18 Jan. 1856. At eight years of age he joined his father, with Grant's army, at City Point, Va., and sold papers to the troops in the field; was educated in the Binghamton public schools; was student of natural sciences under scientific staff of the Weather Bureau for 15 years and under private tutors six years. He served full apprenticeship as printer and pressman on the Binghamton *Republican*, and worked as union printer in Chicago, Burlington, Iowa and Washington, D. C.; entered Signal Corps (now Weather Bureau) 1876, and rose through successive grades to local forecast official in Milwaukee, 1891-94; won professorship of meteorology in open competitive examination against 23 contestants, 1894, and was assigned to duty as district forecaster at Chicago; was chief United States Weather Bureau, 1895-1913; professor applied meteorology George Washington University 1914. He was lecturer for the Royal Institution (London) in 1912; and was lecturer on the Lyceum and Chautauqua circuits; fellow of the American Association for the Advancement of Science; and honorary member of the Royal Meteorological Society (London), and of the Austrian Meteorological Society; was president of the National Geographic Society, 1905-10; and vice-president Washington Acad-

emy of Science, 1900-10. He published 'Descriptive Meteorology' (1904); 'The New Air Mail' (1922); 'Spiritual Gravity of the Cosmist'. Died Pasadena, Calif., 18 Dec. 1927.

MOORE, Zephaniah Swift, American educator, first president of Amherst College b. Palmer, Mass., 20 Nov. 1770; d. 29 June 1823. He was graduated at Dartmouth College in 1793, entered the Congregationalist ministry, and preached at Leicester, Mass., from 1798 until 1811, when he was appointed professor of languages in Dartmouth College. He was chosen president of Williams College in 1815, but failing in his efforts to procure the removal of the institution to the banks of the Connecticut, he resigned in 1821, and was chosen president of Amherst College.

MOOREA, mō"ō-rā'a, or **EIMEO**, i'mē-ō, one of the Society Islands, in the Pacific Ocean, about 20 miles west-northwest of Tahiti, the principal member of the group; area 51 square miles. It consists of deep valleys and abrupt hills — the former well cultivated, and the latter heavily timbered. Here Christianity was first introduced in Polynesia; and here the South Sea College of the London Missionary Society was established. Most of the natives are Protestants. Pop. 1,837.

MOOREHEAD, Warren King, American archaeologist: b. Sienna, Italy, of American parentage, 10 March 1866; d. Boston, Mass., 5 Jan. 1939. He was educated in public schools of Ohio, and devoted himself to the study of Indian archaeology and later studied three years in the Smithsonian Institution, and was afterward engaged in investigations of the earthworks and other Indian relics in Ohio for four years. He had charge of the investigations in Ohio, Utah, Colorado and New Mexico for the Chicago exposition and was curator of the museum of the Ohio State University. He was later curator in the department of archaeology at Phillips Academy. He was a member of the United States Board of Indian Commissioners; and after 1909 investigated conditions on Indian reservations for the Interior Department; fellow of the American Association for the Advancement of Science. He received the degree of M.A. (honorary) from Dartmouth in 1901, and published 'Primitive Man in Ohio' (1892); 'Stone Age in North America' (1910); 'American Indian in the United States' (1914).

MOORE'S CREEK, a short stream in North Carolina, which flows into Cape Fear River about six miles above Wilmington. Moore's Creek is noted on account of a battle fought on its banks, 27 Feb. 1776, between American and British forces. The British soldiers, nearly all Highland Scotch under Brigadier-General MacDonald, numbered 1,500, and the Americans under Caswell and Lillington numbered 1,000. The charge was made by the British, who tried to cross the stream on the girders of a bridge, the planks had been taken away, but the militia and minute men of the American force routed them. Fully 30 British were killed, many wounded, and about 700 taken prisoners. The victory gained by the Americans was an inspiration to the Carolinas; it had the same effect in the South that the Battle of Lexington had in New England.

MOORESVILLE, mōrz'vīl, city, North Carolina, in Iredell County, 14 miles south-southeast of Statesville, and 26 miles north of Charlotte. It is served by the Southern Railway and is on federal and state highways. It is a manufacturing town—the chief business enterprises being the manufacture of cotton, flour milling, and ironworks. Founded in 1868, it was incorporated in 1873, and has council-manager government. Pop. (1950) 7,121.

MOORHEAD, Frank Graham, American editor: b. Council Bluffs, Iowa, Aug. 20, 1876. He was educated at Iowa State College and Grinnell College; engaged in newspaper work in various cities; was associate editor of *Pierce's Farm Weeklies* (1910–1920); editor of *The Farm Journal* (1920–1922), editor in chief *Pierce's Farm Weeklies* after 1922. He published *Unknown Facts about Well Known People* (1923); *Jazz History of the United States* (1925).

MOORHEAD, mōr'hēd, city, Minn., and Clay County seat, altitude 929 feet, on the Red River; 249 miles northwest of Minneapolis, on the Great Northern and the Northern Pacific railroads, and on three federal highways, opposite Fargo, N. Dak. Through the airport at Fargo, it has airline service. Located in a farming region,

handles large volumes of dairy products, and poultry, also wheat and sugar beets. It has sheet-metal works, sugar mills, and makes tents, awnings, and mattresses. It is the seat of a state teachers' college and of Concordia College. The city, named for William G. Moorhead, a director of the Northern Pacific, has aldermanic government. Pop. (1940) 9,491; (1950) 14,870.

MOORISH ART. See ARCHITECTURE—*Islamic*; **MOHAMMEDAN ART.**

MOORS (Lat. *Mauri*; Sp. *Moros*; Dutch, *Jews*), the people of Morocco. The Arabs who conquered the Roman Province of Mauritania in North Africa in the 7th century converted to Mohammedanism the native population, who in Europe were still called Moors, though in their own language they called themselves Berbers, while by the Arabs they were termed *Moghribes*, "westerners" or "men of the west." Arabic manners and customs, and in a corrupt form the Arabic language, soon prevailed in the country, the Arab conquerors freely amalgamating with their converts, who far exceeded them in numbers. In 711 an army drawn from this mixed population, under Arab leaders, crossed the straits at Gibraltar, so named from their leader, and began the conquest of the Spanish peninsula. The Spaniards and Portuguese called these invaders Moors because they came from Mauritania, and the term Moors with them soon became synonymous with Mohammedans or Moslems, as the invaders designated themselves. The Spanish writers subsequently applied the term to all the Mohammedans of northern Africa; and when, at the close of the 15th century, the Portuguese made their way around the Cape of Good Hope and encountered the Arabs on the coasts of East Africa and of Asia, they still called them Moors. See also MOROCCO.

MOOSE. The deer family (Cervidae) embraces not only all the round-horned deer, but also the caribou and moose, whose horns are flattened in a manner known as "palmation."

Of this family, the American moose (*Alces americanus*) is the most colossal and also the most picturesque member. The moose of Europe and Asia, there called "elk" (q.v.), is a much smaller animal. Even in comparison with the largest American elk, the North American moose is a giant, and it is impossible to appreciate fully the great height and bulk, length of leg and size of antlers of this wonderful creature, without seeing a full-grown bull, either in his native wilds or mounted in a museum.

At nearly every point the species presents a peculiarity. The largest specimens ever shot and measured by naturalists stood from 78 to 84 inches in height at the shoulders. The body is very short in comparison with the great length of the legs, but the depth of the chest is unusually great. The end of the nose is flabby and pendulous, and overhangs the end of the chin by three or four inches. In browsing it is half prehensile, and is of great use in conveying twigs into the mouth. A moose in full winter pelage is covered by a coarse thatch of strawlike hair, from three inches in length on the body to six inches on the neck and shoulders. The color of the hair is purplish-gray, and for an animal which lives so far north, the pelage is exceptionally coarse and open

Alaska moose.

The antlers of the moose are strikingly peculiar. The upper two thirds of the beam is enormously flattened, often to a width of 12 inches or more, and the upper end of this great shovel of solid bone terminates in a row of from 6 to 12 short points. The single brow-tine is also well palmated, and usually terminates in three or four long points of great strength. The largest antlers known are in the Chicago Natural History Museum, and have a spread of 78 inches, greatest width of palmation 16 inches, thickness of palmation $2\frac{1}{8}$ inches, and a total of 34 points. The weight of the antlers and skull is $93\frac{1}{4}$ pounds.

The moose is a browsing animal, and its favorite food consists of twigs of the willow, birch, hemlock, spruce, alder, aspen and maple. It also feeds upon moss, and in summer is very fond of wading in ponds and eating the stems and leaves of water-lilies. Because of their very unusual feeding-habits, moose are very difficult to rear in captivity to adult age. Moose calves are born either singly or in pairs, in May or June. At birth an average specimen stands about 32 inches in height, and is a most grotesque-looking creature. Its first coat of hair is sandy-red, like that of a buffalo calf. At 15

months, a healthy young animal is about five feet high at the shoulders. The weight of a large adult male moose is between 1,100 and 1,200 pounds, but the maximum weight for the species would probably reach 1,500 pounds.

The range of the moose extends from Nova Scotia and New Brunswick to northern Alaska, a total distance along the axis of distribution of about 4,100 miles.

The valley of the Ottawa River and its tributaries still affords good moose hunting, as does northern Manitoba. The species still exists in small numbers in northern Minnesota, and along the western slope of the Rockies as far south as the head of the Green River, Wyoming. Northward, moose are found in British Columbia, Alberta, Athabasca, Yukon, and in many parts of Alaska. Those found on the Kenai Peninsula and north of Cook Inlet have the most massive and widespread antlers to be found, and have even been described as an independent species, under the name of *Alecs gigas*.

The killing of moose is regulated by law. Open seasons are very short; the number that may be killed by each hunter is limited to one or two males, and the killing of females is forbidden.

WILLIAM T. HORNADAY.

MOOSE, Loyal Order of, a secret fraternal society founded in 1888 at Louisville, Ky. by Dr. J. H. Wilson. The first lodge was organized in Cincinnati, Ohio. Operating in the United States and possessions, Canada, and the British Isles, membership, restricted to the white race, totaled (1954) 1,085,455 in 3,097 units, including women's auxiliaries. The society's purpose is beneficiary; besides paying sick and death benefits to its members, it maintains a home and vocational school for orphan boys and girls at Mooseheart, near Aurora, Ill., and a home for dependent old people at Moosehaven, Orange Park, Fla. The organization publishes *Moose Magazine*.

MOOSE FACTORY, village, Ontario, Canada, on an island at the mouth of the Moose River in James Bay. It is adjacent to Mooseonee on Moose River, which is a terminus of the Ontario Northland Railway. Both villages are trading posts. Two French-Canadian explorers, Pierre Esprit Radisson and Médart Chouart, Sieur de Groseilliers, were commissioned by Prince Rupert in 1668 to search for the Northwest Passage. After establishing Charles Fort and returning to England with a cargo of furs, they were sent out by the Hudson's Bay Company in 1671, and founded Moose Factory as a trading post. When war broke out between France and England, the post changed hands several times, and was destroyed at the end of the century. Rebuilt in 1730 by the company near the old site, it has retained operations to the present day. Pop. (1941 est.) 300.

MOOSE JAW, city, Saskatchewan, Canada, situated at the junction of Moose Jaw River and Thunder Creek, 45 miles west of Regina. Divisional headquarters for the Canadian Pacific and the Canadian National railways, and for Prairie Airways Limited, it is on the route of the Trans-Canada Air Lines, and is well served by highways. Moose Jaw is located in a large agricultural area. Its industries include meat packing, milling, oil refining, electrical production, stock-

yards, creameries, railway terminal shops, and a woolen mill. The city has a collegiate institute and a teachers college.

The district was first settled in 1882; Moose Jaw was incorporated as a town in 1884 and as a city in 1903. The Indians called it "the place where the white man mended his cart with the jaw of a moose." Pop. (1951) 24,355.

MOOSEHEAD, lake, Maine, 50 miles north of Skowhegan, at an elevation of about 1,000 feet. The largest lake in the state, its area is 126 square miles; it is 35 miles long, and 2 to 10 miles in width. The Kennebec River has its source in the lake, and an outlet leads into the Penobscot River. A lake with many islands, Moosehead is a popular resort for fishermen and hunters. Steamer service connects the shore towns, the Canadian Pacific Railroad runs along the southwestern end, and there is an airport at Greenville on the south shore, where guides and canoes are available.

MOOSEWOOD, local name in the Eastern states and Canada for the striped maple (*Acer pensylvanicum*).

MOPSUS, mōp'sūs, in Greek mythology, a diviner or two diviners of the same name (1). A pre-Trojan War Mopsus, son of Amphyx and Chloris, was one of the Lapithae (q.v.) who took part in the battle with the Centaurs, and was the prophet of the Argonauts, whom he accompanied on their voyage. He died in Libya from the bite of a serpent.

(2) A post-Trojan War Mopsus was the son of Rhacius and Manto, daughter of the seer Tiresias. In a contest of divining the number of figs on a tree, he defeated Calchas, who is said to have died from mortification. Mopsus was killed in a combat with Amphilocheus.

MOQUEGUA, mō-kā'gwā, department, Peru, bounded on the north by Arequipa, on the south by Tacna, on the west by the Pacific Ocean, and on the east by Puno. Its area is about 4,700 square miles. It is watered by the Tambo and Moquegua rivers, and is crossed by the Cordillera Occidental, which here has several volcanic peaks. The climate is dry—semitropical on the coast, with cooler uplands. Mainly agricultural, its irrigated lands produce wine, olives, cereals, sugarcane, and cotton, and on the mountain slopes cattle are raised.

Moquegua, capital of the department, is on the Moquegua River, 60 miles by rail from the port of Ilo, at an altitude of 4,500 feet. It is also on the Pan American Highway. Earthquakes, the latest occurring in 1868, have caused suffering to the city's industry, but it is now a processing center for olives, wine, cotton, and fruit. Pop. department (1950 est.) 42,647; town (1940) 3,888.

MOQUELUMNAN, mō-kēl-ūm'nān, a family of North American Indians, living in California and comprising the Miwok and other tribes. The Moquelumnan family was originally included with the Costanoan in the so-called Mutsun, named after the language, or more probably the village, at the mission of San Juan Bautista. The Moquelumnan family, as at present generally recognized, consists of two detached divisions, the principal one occupying the terri-

tory in the San Joaquin Valley and on the slope of the Sierra Nevada; the other, a smaller territory on and near the coast north of San Francisco. The smaller division comprises three dialects, which are spoken in two separate areas: one near Clear Lake, the other north of San Francisco Bay. That spoken in the area near San Francisco is again divided into two dialects. The people of the principal division of the Moquelumnan family call themselves by some form of the name Miwok. They occupy one of the largest territories held by a single family in California, extending from the Consumnes River on the north to the Fresno and Chowchilla in the south. There are three well-marked Miwok dialects: one in the northern plains, the second in the northern and central hills and mountains and the third in the south. These dialects resemble the northern neighbors of the Miwok people — the Maidu — and not those of the Yokuts to the south. Consult Barrett, S. A., 'Geography and Dialects of Miwok Indians' (Berkeley, Cal., 1908), and Viroeber, A. L. (in *American Anthropologist*, Vol. VIII, Lancaster, Pa., 1906).

MOQUI (mō'kē) INDIANS, a semi-civilized tribe living in northern Arizona. The first accounts of them date from the expedition of Coronado in 1540. Their history is strikingly similar to that of the Indians of New Mexico, except that after a successful revolt against the Spaniards, in 1680, they remained independent. They are kind-hearted and hospitable, cultivate soil, raising grain and vegetables, possess large flocks of sheep and goats and weave very blankets. The houses are built of stone, in mortar, and for security are perched upon the summits of almost inaccessible mesas. They number about 1,600. See INDIANS

MORA, mō'ra, **Francis Luis**, American artist. b. Montevideo, Uruguay, 27 July 1874. He studied art in the School of Drawing and Painting, Museum of Fine Arts, Boston, and the Art Students' League, New York. From 1892 he worked on illustrations for magazines and other periodicals, receiving his first important commission (1900) for a large decorative panel for the Lynn (Mass.) Public Library. In 1904 he did some decorative paintings for the Missouri State building and for the Saint Louis Exposition. He received the Sears prize, Museum of Fine Arts, Boston; Rothschild prize, Arts Students' League; gold medals from the Philadelphia Art Club (1901) and the American Fine Arts Society, Philadelphia (1902); a bronze medal from the Saint Louis Exposition (1904); 1st Hallgarten prize, National Academy of Design (1905); Beal prize, New York Water Color Club (1907); Evans prize and Shaw prize, Salmagundi Club (1908 and 1910); silver medal at Buenos Aires (1915); gold medal San Francisco Exposition (1915). His works are displayed in the Boston Art Club; Lotos Club, New York; Art Gallery, Oakland, Cal.; Columbia University; State Gallery, Dallas, Tex.; National Academy Collection, New York, etc. Spanish influence is apparent in most of his creations, which show true coloring and due attention to detail; his figures are full of expression. Of his best works might be named 'The Letter' (1906); 'The Mendicants' (1906); 'Spanish Café' (1906); 'After the

Bull Fight, Granada' (1910); 'Studio Tea'; 'Evening News.' Died N. Y. City, 5 June, 1940.

MORACEÆ, a family of trees and shrubs (rarely herbs), related on the one hand to the elms and on the other to the nettles, whose botanical characteristics are: flowers unisexual, usually with four perigone leaves; stamens straight or inflexed in the bud; ovary dimerous, with one suspended, anatropous ovule; stipules caducous; juice milky. The species are mainly tropical and include the mulberries, figs, banyans, etc., bread-fruit, osage-orange, rubber or caoutchouc plants, upas tree (qq.v.) and others.

MORAINE, a deposit of sand, gravel or clay made by a glacier. Moraines may be divided into two classes, those that exist on the ice itself and those that are formed at the edge of or under the ice. Of the first type, the most common are the lateral moraines. These are ridges of débris that accumulate on the ice next to the rock wall on either side. They consist in part of material that the glacier has scraped from the valley sides and in part from avalanche débris. When two glaciers unite into one, two lateral moraines are brought together to form a medial moraine. Glaciers that result from many branches uniting may have several such medial moraines. The lower stagnant ends of many large glaciers are wholly covered with débris that was once frozen into the ice, but which has accumulated as the ice wasted away by melting. Such deposits are known as ablation moraines. Forests grow on the ablation moraine of the famous Malaspina Glacier in Alaska. Such moraines as the above three types seldom remain as distinct ridges after the glacier has melted away.

Of the second type, the frontal or terminal moraines are of the most importance. These are formed at the ice front, when loss by melting just equals ice advance, and all the débris is accumulated in one ridge. In the case of valley glaciers, these form dams across the valleys, often producing lakes. In the case of continental ice sheets the moraine may stretch for miles across the country as they do across our Northern States, at the southern margin of the glaciated region. Sometimes the ice in its retreat pauses several times, building a moraine at each pause, in which case they are called recessional moraines. The thin sheet of till (q.v.) that a glacier spreads over the country at large and which results chiefly from material that the ice is forced to drop from the bottom, due to overload, is called ground moraine. Drumlins (q.v.) are a special phase of ground moraine. Morainic débris is mostly unstratified and contains many polished and striated boulders. See also GLACIERS and the section on *Glaciology* in the article on GEOLOGY.

MORAIS, Sabato, American rabbi and educator: b. Leghorn, Italy, 13 April 1823; d. Philadelphia, 11 Nov. 1897. He was carefully trained in Hebrew lore, and taught first in Leghorn and then for a few years in London. In 1851 he came to Philadelphia and until his death was minister of the Mikve Israel Synagogue. In 1867 he was appointed professor of biblical exegesis in the short-lived Maimonides College of Philadelphia, and he was one of the founders and the first president of the Jewish Theological Seminary of New York. During nearly five decades of activity he was a representative of

conservative Judaism, unremitting in his efforts in behalf of education and charity and an earnest and scholarly contributor to the Jewish press on historical, literary and theological themes.

MORAL PHILOSOPHY. See ETHICS.

MORALES, Luis de, loo-ēs' dā mō-rā'lās, Spanish painter: b. Badajoz, about 1509; d. there, 1586. His early artistic life was spent in Andalusia, but he removed to Madrid in 1564, where he remained for the rest of his life, returning to his native city only to die. He was essentially Spanish in his conception of religious art, from his devotion to which he was called "El Divino." The main theme of his paintings was the Dead Christ and the Mater Dolorosa. There is in them a blending of religious austerity with a sense of beauty which recalls the early Italian school, but his figures have the distorted and macerated air which later became the accepted type in Spanish religious paintings. His drawing is monotonous and mannered, and his modeling such as to attenuate into half skeleton proportions the limbs and features, but his coloring is of sweet and melting tenderness. The Madrid Museum has several examples of this master, namely, an 'Ecce Homo,' a 'Mater Dolorosa' and a 'Madonna.' A half-length figure of 'Christ Bearing the Cross' is in the Louvre under his name. An 'Ecce Homo' of his hangs in the Dresden Gallery, and one in that of the New York Historical Society.

MORALITIES, the name given a class of allegorical plays, so termed because they consisted of moral discourses in praise of virtue and condemnation of vice. The dialogues were carried on by such characters as Good Doctrine, Charity, Faith, Prudence, Discretion, Death, etc., whose discourses were of a serious cast. Moralities were occasionally exhibited as late as the reign of Henry VIII. The morality play, 'Every Man,' was performed by Ben Greet's company in America and England in 1902 and 1903. Consult Mackenzie, W. R., 'English Moralities' (New York 1914); Moore, 'English Miracle Plays and Moralities' (London 1907), and Pollard, A. W., 'English Miracle Plays, Moralities and Interludes' (5th ed., Oxford 1909). See DRAMA.

MORALITY. See ETHICS.

MORAN, mō-rān', Edward, American painter: b. Bolton, Lancashire, England, 19 Aug. 1829; d. New York, 9 June 1901. He was a pupil of Hamilton and Weber in Philadelphia and in 1862 went to Europe, where he studied in France and England for seven years. He afterward made his permanent home in New York. His best-known pictures are marines, such as 'Outward Bound'; 'Launch of the Life-Boat' (1865); 'The Coming Storm in New York Bay,' etc. His historical series, representing epochs in American seafaring from the 'Landing of Leif Ericson' (1001) to 'Dewey's Return,' was completed in 1899 and exhibited at the Metropolitan Museum, New York, in 1904. He was a member of the National Academy.

MORAN, Patrick Francis (CARDINAL), Australian Roman Catholic prelate: b. Leighlin

Bridge, Carlow, Ireland, 16 Sept. 1830; Sydney, Australia, 16 Aug. 1911. He received his education at the Irish College, the Gregorian University and the Propaganda, Rome, and was ordained to the priesthood in 1853. He was successively vice-rector of the Irish College, Rome; professor of Hebrew at the Propaganda; vice-rector of the Scots College, an secretary to Paul, Cardinal Cullen, archbishop of Dublin. In 1872 he was consecrated titular bishop of Olba and made coadjutor to the bishop of Ossory. He succeeded to the diocese of Ossory in the same year and remained there until 1884, when he was appointed archbishop of Sydney, Australia. In 1885 he was made cardinal of the Roman Church with the titular church of Saint Susanna. He convened and presided at three plenary synods of the Church of Australia in 1885, 1895 and 1905, and at the Catholic congresses held at Sydney in 1890 and 1909. He was the author of 'Memoirs of the Venerable Oliver Plunkett' (1861); 'Essays on the Early Irish Church' (1864); 'History of the Archbishops of Dublin' (1864); 'History of the Persecutions of the Irish Catholics' (1865); 'Acta Sancti Brendan' (1872); 'Monasticon Hibernicum' (1873); 'Spicilegium Ossoriense' (1874); 'Irish Saints in Great Britain' (1879); 'Pastoral Letters of Cardinal Cullen' (1882); 'Occasional Papers' (1890); 'Letters on the Anglican Reformation' (1890); 'History of the Catholic Church in Australasia' (1894); 'Reunion of Christendom and Its Critics' (1896); 'The Mission Field of the Nineteenth Century' (1900); 'The Patrons of Erin' (1905); 'Priests and People of Ireland' (1905). He founded the *Iri Ecclesiastical Record*; edited it for some time and was a frequent contributor to its pages. He contributed to 'The Catholic Encyclopedia.'

MORAN, Peter, American artist: b. Bolton, Lancashire, England, 4 March 1842; d. Philadelphia, 9 Nov. 1914. He belonged to an artistic family, being brother of Thomas Moran and of Edward Moran, both painters of reputation; he became their pupil at Philadelphia and chose landscape and animal life as a special department. Among his paintings are 'Return of the Herd,' to which a medal was awarded at the Centennial Exhibition; 'San Barbara Mission'; 'Pueblo of Zia, New Mexico.' He was also successful as an illustrator and etcher and at the Centennial of 1876 received a medal for his etchings of animals.

MORAN, Thomas, American artist: b. Bolton, Lancashire, England, 12 Jan. 1837. He came to the United States with his parents in 1844, was educated in the public schools of Philadelphia and studied painting in that city, first exhibiting in the Pennsylvania Academy of Fine Arts in 1856. In 1862 he visited England and at this time formed his great and lasting admiration for the work of J. M. W. Turner, the English landscape painter. In 1871 he accompanied the F. V. Hayden expedition to Yellowstone country and on his return painted 'The Grand Canyon of the Yellowstone,' which was purchased by the government for the Senate Hall in the Capitol. He made a trip to Arizona in 1873 and the result was 'The Chasm of the Colorado,' also bought by the government. He made many other expeditions into the western country and Mexico, also

Europe and painted many canvasses of Venice. About 1873 he removed to New York and at this time did an enormous amount of drawings in wood for magazine illustration and for schoolbooks. He also did much etching. He was a member of the National Academy of Design, the American Water Color Society and similar societies. Other important works from his hand are *Mountain of the Holy Cross*; *Joshone Falls*; *The Grand Canal, Venice*; *The Pearl of Venice*; *The Dream of the Orient*, and *Altitude*. He died Aug. 26, 1926.

MORANT, mô-rănt, Sir Robert Laurie, English educator: b. Hampstead, April 7, 1863; d. London, March 13, 1920. He was educated at Winchester, and at New College, Oxford; B.A. 1885. He undertook educational work of several kinds, becoming tutor to the royal family of Siam and organizer of education in that country. He then took up social and educational work in East London, becoming (1895) assistant director of special inquiries and reports in the educational department, Whitehall, which included education reports on England, France and Switzerland. He was appointed permanent secretary, Board of Education, 1903-1911, and was chairman of the Insurance Commission after 1912. He was created knight commander of the bath in 1902.

MORAT, mô-râ' Switzerland, town in the Canton Fribourg, located on Lake Morat and on the Palézieux-Lys and the Ins-Fribourg railways. It has a 13th century castle, but is chiefly noted for the brilliant victory of the Swiss and their confederates over Charles the Bold, June 22, 1476. Consult Ochsenbein, *Die Urkunden der Belagerung und Schlacht von Murten* (Basle 1876).

**MORATIN, mô-râ-tên, Leandro Fernán-
dez**, Spanish dramatist: b. Madrid, March 10, 1760; d. Paris, June 21, 1828. He was son of Nicolas (q.v.) and was early instructed in poetic art, and (1786) went to Paris as secretary of Count Cabarrus, where he gained the acquaintance of Carlo Goldoni who strengthened his purpose of reforming the Spanish stage by introducing French rules. Returning (1789) to Spain he was granted a benefice by Minister Florida Blanca which permitted him to follow a literary life. His first comedy, *El Viejo y la Niña* (1790) was successful and it was followed by the satiric play *La Comedia nueva* (1792) which revenged him for the opposition given him by the old adherents to the national taste. Prince Godoy afforded him the means to visit France, England, Germany, Switzerland and Italy, returning in 1796. Next year appeared his *El Barón, La Mogigata*, (1804); *El Sí de las Niñas* (1806), the latter proving an immense success and soon being translated into various languages. Under French occupation he accepted (1811) the post of librarian to King Joseph from which persecution drove him to exile and he settled (1822) in Paris. His plays have their characters drawn true to life, the dialogues are lively and these works show originality. Concerning the history of Spanish drama he wrote *Orígenes del Teatro español* (1838), a worthy work. The Spanish Academy published his operas (Madrid 1830-1831). Consult also Ford, *Si de las Niñas* (Boston 1899).

MORATIN, Nicolas Fernandez de, Spanish poet and dramatist: b. Madrid, July 20, 1737; d. there, May 11, 1780. He studied law at Valladolid, devoting time also to fine arts, and received a position in court after finishing his studies. He first turned to the drama, starting with the play *La Petimetra* (1762). Next came *El poeta* and the tragedy *Lucrece* in orthodox style which he held to in his later *Hormesinda* and *Guzman el Bueno*. His last and superlative work was *Canto épico de las Naves de Cortes destruidas* (1765), one of the finest of the Spanish heroics. R. Foulcké-Delbosc published his remaining works under title of *Poesias ineditas* (Madrid 1892).

MORATORIUM, the legal postponement for a given period of the payment of debts usually of an intergovernmental character, as for instance the moratorium of international obligations carried forward by President Herbert Hoover in June 1931 as a remedy for world depression.

MORAVA, Yugoslavia, a river about 250 miles long, formed by the confluence at Staladsh of its head streams, the western Morava rising near the western boundary, and the southern Morava, with its source north of Uskub. It flows into the Danube and is navigable 50 miles from its mouth in the Danube River, 30 miles east of Belgrade.

MORAVA, a river of Czechoslovakia. See MARCH.

MORAVIA, province of Czechoslovakia, formerly a province of the Austro-Hungarian Empire. From March 16, 1939, when Germany completed the dismemberment of Czechoslovakia, until early May 1945, Moravia, with the adjoining province of Bohemia, was ruled as a "protectorate" with savage brutality. National liberation at the close of World War II restored its status. Moravia consists of a large basin surrounded on the north by the Sudeten mountains, on the east by the Carpathians and on the west by a low range of hills extending northward to join the Sudetens and sloping toward a central point at the south. Its climate is milder and more genial than that of most European countries under the same latitude, the mean at Brünn being 48° Fahrenheit. Moravia belongs to the basin of the Danube, all the smaller streams falling into the March or Morava, a tributary of the Danube. About 55 per cent of the land is arable and 27 per cent is occupied by forests. The minerals are of considerable importance and include silver, lead, copper, iron, coal, graphite, etc. The soil is generally fertile and all the ordinary cereal, leguminous and root crops are raised in abundance. Flax of excellent quality is extensively grown in several districts and fruit is so abundant that many parts of the country have the appearance of one great orchard; but the favorite culture is that of the vine, for which both the soil and exposure of the province are admirably adapted. The pastures, in general excellent, occupy a large extent of surface. The rearing of cattle, nevertheless, gets comparatively little attention and is not sufficient to meet the home demand. Sheep, on the other hand, are reared in abundance and are of good

quality. They have been much improved by judicious crossing with the merino and furnish a wool, to the excellence of which the woollen manufactures of the country owe their prosperity. The horses, too, are of a strong, hardy, active breed and were much used in the Austrian service for heavy cavalry. Manufactures have made great progress and in all the great branches of industry—in iron and ironmongery, leather, linen, cotton and woollen tissues, particularly the last—Moravia takes precedence over most of her neighboring provinces. Other manufactures deserving of notice are silk, glass, paper, potash, tobacco and beet-root sugar. The trade in most of these articles is of considerable importance. The waterways are unimportant. Formerly about 71 per cent of the inhabitants were of Slavonian extraction and 28 per cent Germans, though the latter percentage grew after the German invasion. The language chiefly used, known as Moravian, is a Slavic dialect; German, however, is generally understood by all classes. The religion almost universally professed is Roman Catholic (91 per cent) and 3.2 per cent Protestants. Elementary education is generally diffused and numerous gymnasia furnish education of a very superior order. There are theological colleges at Olmütz, and Brünn (Brno) which is the capital of the province (pop. 1930, 264,925). Moravia was anciently inhabited by the Marcomanni and Quádi, afterward by the Rugii, and still later by the Longobardi. It was finally occupied by a colony of Slavs, who took the name of Moravians from the river Morava. In 1029 Moravia was united to the kingdom of Bohemia, with which it had the same constitution, administration and laws. In 1197 it was erected into a margraviate, with a separate court and a separate administration. With Bohemia it passed to the house of Austria in 1527. In 1849 it was separated from Bohemia and erected into a distinct province. Moravia subsequently sent 49 members to the Austrian House of Deputies and the provincial diet was composed of 151 members, the majority elected by nationalities German and Bohemian. On Oct. 28, 1918 Moravia united with Bohemia, Slovakia and Ruthenia to form Czechoslovakia. From 1939 to 1945 Moravia and Bohemia were "autonomous protectorates" of Germany. The area of Moravia is 8,616 square miles. Pop., including Silesia (1930) 3,565,010.

MORAVIAN CHURCH, The, the common name given in England and America to the renewed *Unitas Fratrum* or Church of the Brethren—for a time styled also in English the Church of the United Brethren—which originally flourished in Bohemia, Moravia and Poland, was disrupted and suppressed in the 17th century, was resuscitated in Saxony in the 18th century and at present exists in its reorganized form in Europe and America with an extensive mission work in many parts of the world. It was a product of the evangelical movement led by the Bohemian reformer, John Hus, who suffered martyrdom at Constance, July 6, 1415. It developed out of an association formed in 1457 near Kunwald in northeastern Bohemia to foster pure Christian teaching and life within the National Church. Its attitude toward the abuses of the time and its rapid growth caused it soon to be put under proscription by the

authorities. Drastic measures intended to suppress and disintegrate it had the contrary effect. It formed a more compact union, perfected its organization and gradually became a distinct church with its own ministry, established through the good offices of Waldensian bishops who conveyed the historic episcopate to it in 1467. A system was developed which followed primitive Christianity in its elementary principles. It began with the congregation as the unit, based on Scripture, bound by a Brotherly Agreement and governed by an elected eldership. With the increase of congregation, the Synod was formed, legislating by delegated authority. The Synod committed executive control to the Council which was also elective and representative, for while the episcopacy stood at the head, the presbytery and the laity had a voice in it, with the central principle of confessional government and collegiate administration fixed. This principle, inherited with the ancient episcopate, is cardinal in the modern structure of the Church, adjusting together conceptions of polity commonly regarded as opposites and presenting affinities to widely divergent church types.

Its history during the ancient period is to a great extent one of cruel persecution. Its speedy recuperation after such ordeals and its increase during intervals of peace were phenomenal. When the German Reformation began in 1517, the Bohemian and Moravian Brethren numbered nearly 200,000 with about 400 places of worship. In the baronial castle and in the peasant's cottage loyalty to their Church, which embodied the best ideals of the nation, rendered them amenable to a discipline in which they stood pre-eminent and made them a strong moral power to be coped with by ecclesiastical and political authorities. In their highest ascendancy they led the educational and literary activity of the regions in which they were established. Their formulated conceptions of Christian doctrine were a gradual growth. Their last and most mature confession of faith before the overthrow of the Church in its original seats was published in 1573.

The Counter-Reformation inaugurated by Ferdinand II in 1621 brought the organized existence of the Church to an end in Bohemia and Moravia, subjected many of its members to martyrdom and drove thousands into exile. It was excluded from the terms made to other evangelical parties in the Peace of Westphalia which ended the Thirty Years' War in 1648, and the hope of its resuscitation in its home-lands was crushed. The parishes of its Polish province, founded in 1548, maintained an organized existence much longer, but they were gradually absorbed by the Reformed Church of Poland of which ultimately even the clergy in whose persons the episcopate of the *Unitas Fratrum* was being perpetuated in the hope of its renewal were legally recognized ministers.

The first step in the restoration of the Church occurred in 1722, when a little company of refugees from Moravia were given an asylum by Nicholas Lewis, Count of Zinzendorf, on his estate, Berthelsdorf, in Saxony where, on June 17 of that year, they began a settlement which was called Herrnhut. Many others from Moravia, Bohemia and different parts of Germany joined them during the next few years.

and a gradual process of organization took place in which the plans of the Moravians were merged with those of Zinzendorf who had in view rather an evangelical association harmonizing different confessional affiliations and Church traditions, with the necessary adaptation of the whole to its situation within the pale of the state church. The doctrinal articles of the Augsburg Confession were adopted and concessions from the Saxon and Prussian governments permitted the establishment of Moravian Church order and constitution modified to suit the new conditions.

The Moravian episcopate was transferred to the new organization on 13 March 1735, when David Nitschmann was consecrated a bishop at Berlin by Bishop Daniel Ernst Jablonsky with the written concurrence of Bishop Christian Eukowus of Lissa, they being the last two surviving bishops of the old line. A notable spiritual experience which marked the year 1727, when the first definite organization took place at Herrnhut, produced an intense zeal for evangelization. The result, during the next few years, was the establishment of other congregations on the continent of Europe, the founding of the Church in England and America and missions to the heathen which have chiefly given the Church its reputation. The first such mission was begun in 1732 on the island of Saint Thomas, West Indies.

The first Moravian evangelist came to Pennsylvania in 1734. The first settlement in America and mission to the Indians was founded at Savannah, Ga., in 1735. Untoward political conditions caused its abandonment in 1740 and the removal of the colonists to Pennsylvania, where a permanent settlement arose in the present Northampton County, with organized activity in Philadelphia and New York and an extensive itinerary among white settlers and Indians. The Moravian pioneers in «the Forks of the Delaware» first located on a tract of land which the evangelist George Whitefield had purchased and named Nazareth, where he proposed to found a village and a negro charity school. This property came into possession of the Moravian Church in 1741. On another tract at the confluence of the Monocacy Creek and the Lehigh River its chief settlement was founded in that year and at Christmas 1741, when Count Zinzendorf was at the place, it received the name Bethlehem. In June 1742, a considerable colony from Europe joined the pioneers and the settlement was regularly organized. The population was divided into an itinerant and a local congregation, the former to engage in gospel work among white settlers and Indians, the latter to develop the settlement and provide support for the missionaries. Thus, from the first, Bethlehem was the centre of the Moravian Church in America and of its various activities.

Until 1762 a co-operative union was maintained at Bethlehem and Nazareth which was called the General Economy. All labored for a common cause and received sustenance from a common stock, but there was no surrender of private property and no obligation which prevented the individual from withdrawing when he chose. Numerous colonies came to America during those years on vessels owned and managed by the Church and under the arrangement which existed results were accomplished which could not otherwise have been possible. The

material benefits of the settlement were appreciated by the authorities of Pennsylvania, and the spiritual activities prosecuted by the Moravians, although misunderstood and opposed by some, as was the case also in Europe, were epoch-making in the religious growth of the country.

Two notable lines of effort in colonial times, in addition to the Indian missions, were the propagation of Zinzendorf's idea of evangelical alliance and denominational federation, and religious education of children. Desiring to diminish rather than increase denominational divisions the leaders of the Church generally refrained from organizing distinctly Moravian congregations and in consequence of this policy the Moravian Church remained numerically a small body. The European plan of the Church to concentrate in exclusive settlements to some extent was followed for a full century. Besides Bethlehem and Nazareth, such church-villages, founded prior to the Revolutionary War, were Lititz in Lancaster County, Pa., Hope in Sussex, now Warren County, N. J., abandoned in 1808 - and Salem, now a part of Winston-Salem in Forsyth County, N. C., the central settlement on a large tract of land purchased of the earl of Granville and named Wachovia. These places continued long to be conserving centres of all that was distinctive in the religious and social life of the Moravian Church, as fostered under the influence of Zinzendorf's ideas and methods, presenting interesting experiments in municipal government, industrial order and general culture. They are yet the seats of widely known educational institutions, all founded in the 18th century. A few of the town and country congregations organized in colonial times, without the peculiarities of the church settlements, are yet in existence. During the years from 1844 to 1856, the exclusive system was entirely abolished by all of the Moravian villages in America and their unique character rapidly disappeared. At that period active home mission work was revived and since then many congregations have been founded in various parts of the United States. The most fruitful of these efforts have been in several of the Northwestern States.

The Moravian Church has no peculiar doctrines. It is simply and broadly evangelical, in harmony with other Protestant denominations on the cardinal doctrines of Christianity, and bound by no articles on the points of difference. Its only prominent doctrinal feature is the strongly Christ-centred tendency of its teaching which pervades its official statements, its liturgy and its characteristic preaching. The digest («Results») of the General Synod, the catechisms and the Easter Morning Litany sufficiently set forth the doctrinal position of the Church. The Church has an established liturgical system, with a litany used regularly on the Lord's Day, and a variety of offices for different Church seasons, in which special prominence is given to singing; the cultivation of church music having always been a conspicuous feature of the Moravian cultus. The general order of the ancient church year is observed in the services. Of distinctive services retained by some congregations, the love-feast, introduced in 1727 in imitation of the Agapæ of the Apostolic Church, is the most conspicuous. Moravian orders of the ministry are bishops,

presbyters and deacons. A diocesan episcopacy does not exist. The bishops are, as such, everywhere on a parity, representing the entire *Unitas Fratrum*. They are ex officio members of the General Synod and of the synods of the several provinces in which they reside. Besides having the exclusive function of ordaining men, they are looked to as pre-eminently the guardians of sound doctrine and established order. In governing boards they officiate, not by virtue of episcopal authority, but by election, and those who do not occupy executive positions serve, meanwhile, in pastorates. The Moravian Church in America is divided into a Northern and a Southern province, constituting, with the British and German branches of the Church, an organic unity under the General Synod. The legislative authority of each province is the Provincial Synod which elects an executive board known as the Provincial Elders' Conference and composed usually of a bishop and two presbyters. The Northern province is divided into districts, each organized with its synod and its executive board. The communicant membership of the American Church in 1926 was 26,217 and its total 37,707. The enrolment in the 14 mission provinces of the Church was 110,820 and its grand total in all countries was 236,540, besides 70,000 members of the state churches of Europe, ministered to by Moravian home missionaries.

Bishop J. M. LEVERING.

Revised by J. H. CLEWELL,
President of the Moravian Seminary and College, Bethlehem, Pa.

MORAVIAN COLLEGE FOR WOMEN, institution of the higher learning at Bethlehem, Pa., founded soon after the Moravian settlement of Bethlehem (1741). It is the second oldest girls' boarding school in the United States, the Ursuline Academy, New Orleans (7 Aug. 1727), being the first. "Colonial Hall," built in 1748, is the oldest structure in the group of buildings owned by the seminary. From the roof of this building it was customary in pre-Revolution days to play the trombone on festal occasions or to announce the death of members. Tradition says that on one occasion during the French and Indian War a band of Indians had planned to attack the settlement, and at sunset as they lay waiting on Calypso Island, for the darkness, they heard a

strange melody floating down from the sky. They had never heard anything like it before, and thinking it must be the voice of the Great Spirit warning them, they held a hurried council, and silently stole away in the darkness. In 1776-78, "Colonial Hall" served as a military hospital for the Continental troops. After the battle of Brandywine the place was crowded with wounded. On the slope of the hill just west of Monocacy Creek, are the graves of over 500 of unknown dead. Many of the distinguished women of the nation have graduated at this institution. A preparatory school, music, art and science departments are connected with the seminary, and several years ago a fully accredited college course leading to A.B. and B.S. degrees was added, and is recognized by the College and University Council of Pennsylvania. Consult Schwarze, 'History of the Moravian College and Theological Seminary' (1909).

MORAVIANS. See MORAVIAN CHURCH.

MORAWETZ, Victor, American lawyer b. Baltimore, 3 April 1859; d. Charleston, S. C., 18 May 1938. He studied at foreign universities, and received his LL.B. at Harvard (1879); his LL.D. at Williams (1914); admitted to the bar (1880). In his practice of law he acted chiefly in the capacity of counsel for railway and other corporations. He was general counsel, director and chairman of the board of directors of the Atchison, Topeka and Santa Fé Railway Company, and later director and member of the executive committee of the Norfolk and Western Railway Company, as well as director in other corporations. He wrote 'Law of Private Corporations' (1882); 'Banking and Currency Problems in the United States' (1909); 'Elements of the Law of Contracts' (1927).

MORAY, mür'rē, Earl of. See STUART, JAMES, EARL OF MURRAY or MORAY. More correctly STEWART: it was Mary Queen of Scots who adopted the latter spelling STUART.

MORAY FIRTH, Scotland, a large bay on the northeast coast, containing at its widest extent the sea enclosed by a line running from Duncansby Head in Caithness-shire to Kinnaird Head in Aberdeenshire. It thus comprises the Dornoch Firth and the inner Moray Firth, to which the name is more strictly applied, the entrance to which lies between Tarbet Ness in Cromarty and Burghead in Elginshire, and which gives off Cromarty Firth and Beaulie Firth and Loch. The opening of the outer firth to the North Sea is 80 miles in width. The rivers which enter the firth include the Deveron, Spey, Findhorn, Ness, Beaulie, Oykel.

MORAYS, eel-like fishes of the family *Muraenidae*. These, says Jordan, may be distinguished by the small round gill openings and the absence of pectoral fins. The skin is thick and tough, the narrow jaws are armed with knife-like or else molar teeth, and the lower one is moved by muscles of extraordinary size and power. They are carnivorous and pugnacious fishes, and some of them, which reach a length of five or six feet, may be dangerous to bathers and fishermen. They abound in the tropics, lurking in the crevices of rocks, coral reefs and similar places, and most of them are colored in striking patterns, as fine marblings of black or lustrous green, or varied spotting

Several genera and more than 100 species are known, of which a celebrated type is the *muraena* (*Muraena bellina*) of the Mediterranean Sea, which was extensively cultivated by the Romans, in the classic period, for the sake of its flesh. Two or three species are well known as food-fishes on both coasts of tropical America, and one, usually called "conger," is similarly utilized in southern California.

MORAZAN, Francisco, frän-sēs'kō mō-rā-san', Central American soldier and politician: b. Tegucigalpa, Honduras, 1799; d. San José, Costa Rica, 15 Sept. 1842. He early entered political life and in 1824 was secretary-general of Honduras; when Honduras and Salvador revolted against President Arce of Central America, Morazan came rapidly to the front as a military leader, and in 1830, after a series of brilliant military exploits, was elected President of the Central American Confederation. Though a wise ruler, his administration was interrupted by several revolts. At the close of his second term it was found that no provision had been made for electing his successor, and in spite of his efforts the union of the states of Central America was dissolved and he himself compelled to find refuge in Peru. In 1842 he landed in Costa Rica, proclaimed the federation of the states, and after defeating Carillo assumed the Presidency at San José. A revolution followed directed against his federal proclivities and he was captured and shot. Consult Bancroft, ('History of Central America') (Vol. III, 1887).

MORDANT, in dyeing, a substance which is capable of penetrating the fibres of the substance that is to be colored, or of forming an insoluble deposit upon them, and which also forms an insoluble compound with the dye that is to be used. Mordants vary greatly in character, according to the nature of the dye and of the fabric. They may be classified, however, as "acid" and "basic"; an acid mordant being required to fix a basic dye and a basic mordant to fix an acid dye. Tannic acid is a typical example of an acid mordant. Cotton may be mordanted with this substance by soaking it in a solution of tannic acid and then passing the fabric through a solution of a salt of antimony, tin or some other suitable base, by which the tannic acid is fixed upon the fibre in the form of an insoluble tannate, with which the dye subsequently combines. The acetates and sulphates of aluminum and of iron may be cited as examples of basic mordants. Wool may be mordanted, for example, by boiling it in a dilute solution of such a salt (usually with the addition of certain other substances, such as cream of tartar or oxalic acid), the wool causing the mordant to partially dissociate, so that a more basic compound is deposited upon and within its fibres, while a more acid one remains in solution. Wool, when treated in this way, will fix dyes (such as alizarin) that are of a phenolic character. See DYEING.

MORDECAI, mōr'dē-ki, Alfred, American engineer: b. Warrenton, N. C., 3 Jan. 1804; d. Philadelphia, 23 Oct. 1887. Graduating at the head of his class from West Point in 1819, he became 2d lieutenant of engineers, and after work as instructor at West Point and assistant engineer was appointed captain of ordnance

corps 30 May 1832. He was assistant to the chief of ordnance at Washington (1838-42) and member of the ordnance board (1839-60). Brevetted major (1848) for meritorious conduct in the Mexican War, he was sent to the Crimea (1855-57), his observations on military organization and ordnance being published by order of Congress in 1860. He resigned from the service in 1861, settling in Philadelphia, where, after acting as assistant engineer of the Mexican and Pacific Railroad (1863-66), he became (1867-87) treasurer and secretary of canal and coal companies controlled by the Pennsylvania Railroad. Among his works are 'Digest on Military Laws' (1833); 'Reports of Experiments on Gunpowder' (1845-49); 'Artillery for the United States Land Service,' as devised and arranged by the Ordnance Board with plates (1849); 'Ordnance Manual for the Use of Officers of the United States Army' (1841 and 1850).

MORDECAI, Alfred, American engineer, son of the preceding: b. Philadelphia, 30 June 1840; d. 20 Jan. 1920; graduated, West Point (1859); and brevetted 2d lieutenant, topographical engineers. After service on the field (June-August 1861) he taught at West Point for nearly a year and then was promoted until he became chief of ordnance, Department of the South (1863-64). From May to September 1864 he was chief of ordnance, Army of the James, later holding similar office in the Army of Ohio, Army of the Cumberland, and military division of the Tennessee. Brevetted lieutenant-colonel for services in the war (13 March 1865), he was instructor of ordnance and gunnery at West Point 1865-70, and again 1874-81. He was commander, with rank of colonel, of the Benicia (Cal.) arsenal, 1899-1902; promoted brigadier-general and retired in January 1904.

MORDENITE, a native hydrous silicate of aluminum, potassium, sodium and calcium, occurring in small monoclinic crystals, or in small hemispherical concretions with a fibrous structure. It is white, or nearly so, with a vitreous lustre. Mordenite occurs at Morden, N. S., and in western Wyoming.

MORDVINS, mōrd'vīnz, a race of people scattered over the Volga provinces of European Russia and to the south and east of these, and belonging to the Ural-Altaic family. There are two distinct groups, the Ersh or northern and the Moksha or southern, with differences in feature, and the latter of darker hue. They are a well-built, hardy race, and superior to the Russians by whom they are surrounded. Their chief sources of livelihood are cattle-rearing, hunting, fishing and bee-keeping, and they are famous as carpenters and woodworkers. They are nominally Christians, the work of conversion beginning at the time of the Empress Anna; but their Christian beliefs have been superimposed on remains of the old pagan worship. Pop. about 1,000,000.

MORE, mōr, Hannah, English moralist: b. Stapleton, near Bristol, 2 Feb. 1745; d. Clifton, near Bristol, 7 Sept. 1833. She was educated in the seminary in Bristol kept by her elder sisters, and her talents early made her acquainted with Johnson, Burke, Garrick and other literary men of the period. Her first

success was as a dramatic writer. The *Inflexible Captive*; 'Percy'; and 'The Fatal Captive' were successfully brought out through the patronage of Garrick and her other friends. After the production of the last in 1779 she gave up playwriting from religious motives, and devoted herself to writing works of a moral and religious tendency, the diffusion of tracts and other philanthropic labors. In this new course her talents commanded an extraordinary measure of success. A series of tracts called the 'Cheap Repository,' commenced at Bath in 1795, is said during the first year to have had a circulation between 1,000,000 and 2,000,000 copies, and led to the foundation of the Religious Tract Society. Her most popular fiction, 'Cœlebs in Search of a Wife' (1809), ran through eight editions in the course of a year, and passed through 30 editions in America. Sydney Smith's hostile review of this work in the *Edinburgh* is highly diverting. Her works include 'Strictures on the Modern System of Female Education' appeared in 1799, followed by 'Hints Towards Forming the Character of a Young Princess' (1805); 'Practical Piety' (1811); 'Christian Morals' (1813); 'Character and Writings of Saint Paul' (1815); 'Moral Sketches, with Reflections on Prayer' (1817). Consult Roberts, 'Life of Hannah More' (1838); Thompson, 'Life of Hannah More' (1838); 'Correspondence of Hannah More with Zachary Macaulay' (ed. by Roberts, 1860); Yonge, C. M., 'Hannah More' (1888); Harland, Marion, 'Literary Hearthstones: Hannah More' (1900).

MORE, Louis Trenchard, American educator: b. Saint Louis, 9 April 1870. He studied at Johns Hopkins taking (1895) the degree Ph.D. He was instructor of physics (1896) at Worcester Polytechnic Institute and was appointed instructor and adjunct professor of physics at the University of Nebraska (1896-1900), becoming professor of physics (1900) and dean (1910-13). He was dean of the Graduate School (1916) at the University of Cincinnati. He has written 'The Limitations of Science' and 'The Dogma of Evolution'; also technical articles on such subjects as light, electricity, magnetism, ionization and sound.

MORE, Nicholas, English colonist: b. England: d. Philadelphia, Pa., 1689. He was a physician and left a promising career in England to come with William Penn to America in 1682. He was from the first prominent in the affairs of the colony, was president of the first assembly in 1682 and in that year presiding judge of the courts of Philadelphia. In 1683 he was clerk of the provincial council and the next year was speaker of the assembly. He was appointed first chief justice of the Supreme Court of the province in 1684, and in this position incurred the disapproval of the colony and was impeached for having wielded "an unlimited and arbitrary power." He retained the confidence of Penn, however, who appointed him in 1686 one of the five commissioners in control of the government.

MORE, Paul Elmer, American author: b. Saint Louis, Mo., 12 Dec. 1864. He was graduated at Washington University in his native city in 1887, studied later at Harvard and was instructor in Sanskrit there for a year and subsequently at Bryn Mawr for two years. He

was literary editor of *The Independent*, 1901-03; of the *New York Evening Post*, 1903-09; editor of *The Nation*, 1909-14. He was elected a member of the American Academy of Arts and Letters in 1915. His fine scholarship and effectiveness of method placed him in the front rank of American literary critics. His published volumes include: 'The Great Refusal' (1900); 'Shelburne Essays' (11 vols. 1904); 'Platonism' (Lectures, 1917); 'The Religion of Plato' (1921); 'Hellenistic Philosophies' (1923); 'The Christ of the New Testament' (1924). He translated 'Judgment of Socrates'; 'Prometheus Bound.' Died 9 March 1937.

MORE, Sir Thomas, English statesman and author: b. London, 7 Feb. 1478; d. there, 6 July 1535. In 1492-94 he studied at Canterbury Hall, now Christ Church, Oxford, and in 1494 was a student in Lincoln's Inn. At 21 he obtained a seat in Parliament, and distinguished himself with spirit in opposition to a subsidy demanded by Henry VII. After being admitted to the bar he enjoyed great reputation as a pleader. In 1516 he accompanied the commissioners sent to renew the alliance between Henry VIII and Charles, then Archduke of Austria, and showed much ability. In 1516 he published his celebrated political romance 'Utopia.' Cardinal Wolsey pressed him to receive a pension, which he refused as inconsistent with his official duties; but he was induced to accept the place of master of requests. He was shortly after knighted, and taken into the Privy Council. In 1521 he was appointed treasurer of the exchequer, and in 1523, at the instance of Wolsey, was elected speaker of the House of Commons. He was joined with Wolsey in a mission to France in 1527 and on his return made Chancellor of the Duchy of Lancaster. In 1529 he succeeded the cardinal as Lord High Chancellor, which office he filled for three years with scrupulous integrity, but he was severe in his punishment for heretical opinions. Unable to acquiesce in the king's wishes respecting his divorce from Catherine of Aragon, he obtained permission to resign the seals. The affront rankled in the mind of Henry, and was further inflamed by his refusal to attend the coronation of Anne Boleyn. An attempt made to implicate him in the practices of Elizabeth Barton altogether failed; and he also perfectly cleared himself of the charge of inducing the king to publish the book against Luther, in which the Pope's authority was held forth—a doctrine now found inconsistent with the intended attack on the Roman See. The king was declared supreme head of the Church in 1534; but More steadily refused to recognize any other head than the Pope, declined to take the oath of supremacy and was consequently committed to the Tower and indicted for treason. After an imprisonment of 12 months, he was brought to trial, and despite his eloquent defense condemned and sentenced to be hanged and quartered. The king altered the sentence from hanging and quartering to beheading, and this act of grace More received with his usual vein of humor. While in prison he wrote a 'Dialogue of Comfort against Tribulation' and a treatise on Christ's passion. At his execution he comported himself with dignity and with a

reat degree of good humor. The news of his death startled Catholic Europe, and British ambassadors were instructed to explain that it was done by due legal process. More's earning was varied and extensive, his wit abundant and his elocution ready and agreeable. He wrote elegant Latin prose and verse, and a terse and simple English. His 'Utopia' is a classic of literature, and he, one of the rightest spirits of the Renaissance. In 1886 canonization was conferred on More by the Roman Catholic Church and he was canonized by Pope Pius XI in 1935. His English works were published collectively, in 1557, and his Latin in 1567. (See UTOPIA). Consult the 'Life' by Cooper (1626, reprinted 1716), and Stapleton's 'Tres Thomae' (1588), the principal sources; and the biographies or studies by Bremond (Eng. trans. with bibliography, London 1904); Bridgett (ib. 1891); Campbell's 'Lives of the Chancellors' (ib. 1845-48); Sir Sidney Lee's 'Great Englishmen of the 16th Century' (ib. 1904); Manning's 'Household of Sir Thomas More' (ib. 1851) and 'The Book of Sir Thomas More' in 'Malone Society Reprints' (ib. 1911).

MOREA. See PELOPONNESUS.

MOREAS, mō'ra'a', Jean, French poet and author: b. Athens, 15 April 1856; d. 1910. His real name was Jean Papadiamantopoulos. He was sent to Paris to study law but, from 1882, devoted himself entirely to poetry. His poems, 'Les Sytres' (1884) and 'Les Cantiques' (1886), made him one of the most prominent representatives of symbolism. In the novel, 'Le Thè chez Miranda' (1886), so hard to understand, he tries to bring prose under the same new tendency. His poem, 'Le Pèlerin assigné' (1891), shows a happy leaning toward Ronsard. The six books of 'Stances' (1905), contain most of his more perfect works. He wrote a version of Euripides' 'Iphigenia in Aulis' (1903) in semi-archaic language, which was produced at the Odéon, Paris, with success. Consult Gourmont, J. de, 'Jean Moreas' (Paris 1905).

MOREAU, mō-rō, Gustave, French painter: Paris, 1826; d. there, April 1898. He began his career under the influence of Delaunoy, but on going to Rome he chose as his special subjects of study the fantastic architectural effects of Mantegna and the dramatic composition and sometimes violent poses of Luca Signorelli. His works show the characteristics of these masters and are eminently original both in design and coloring, though little known until the latter days of his life, as seldom exhibited until he was past 40, or offered his works for sale. On his death he left upward of 800 canvases to the municipality of Paris to form the Musée Moreau. In 1892 he was appointed professor in the Ecole des Beaux-Arts and held the position till his death. He was made an officer of the Legion of Honor in 1883. His most notable pictures are 'Death of the Young Man' (1865); 'Orpheus' (1867) in the Luxembourg; 'Prometheus' (1869); 'Hesiod and the Muses' and 'The Apparition,' the last two in the Luxembourg also. Consult Ary Renan, 'Moreau' (Paris 1900); Lat, 'Le Musée Gustave Moreau' (ib. 1905); further, 'History of Modern Painting' (London 1896).

MOREAU, Hégésippe, French poet: b. Paris, 9 April 1810; d. there, 20 Dec. 1838. Of illegitimate descent, losing both parents early, he died young, in poverty and need, in a hospital. He set up type for a book-printer, first in Provins, then at Paris, but found no favor or success in his writings. Tenderness and nobility of character appear in his earlier poems with excellent effect but his more mature works show the ills of fashion and the world's sorrows. His finest poems are the elegies, 'La Voulzie,' etc. Among his novels are 'La Fermière,' 'Contes de ma sœur' and the shy prose nouvelles, 'Le gui de chêne,' etc. His works are published under the title 'Myosotis' (1838) and his correspondence in 'Œuvres complètes' (1890-91). Consult Moret, J., 'Hégésippe Moreau' (Provins 1871).

MOREAU, Jean Victor, French general: b. Morlaix Finistère, 11 Aug. 1763; d. Laun, Bohemia, 2 Sept. 1813. His father was a lawyer and the son, apparently against his will, studied law and held a post in the judiciary at Rennes. But at the beginning of the Revolution he entered politics, formed a company of the National Guard and in 1791 was elected lieutenant-colonel of a volunteer battalion which joined Dumouriez in the field. He rose rapidly, replaced Pichegru in 1795 as commander of the Army of the North, and in 1796 was put at the head of the Army of the Rhine and the Moselle. His retreat before a superior force after Jourdan's defeat at Würzburg, and his swift movement to the attack again before the truce of Leoben proved him a masterly strategist. Momentarily retired for failure to reveal Pichegru's Royalist plot, he was recalled in 1799; served under Scherer in Italy and largely recouped his superior officer's losses; succeeded Joubert after that general's death; was Bonaparte's confidant in the *coup d'état* of 18th Brumaire; passed the Danube and the Rhine; defeated the Austrians in a series of brilliant engagements culminating in Hohenlinden (1800); and then with the backing of the Royalists attempted to oust Bonaparte. He was found guilty of plotting against Napoleon and was exiled from France for two years, which he spent on a farm in Pennsylvania. Although Republican in his sympathies, in his last campaign he took arms with the Allies, served against France in 1813 and was killed at the battle of Dresden. Consult Jochmus, 'General Moreau' (Berlin 1814); Ary Renan, 'Moreau' (Paris 1900).

MOREAU RIVER. One of the larger branches of the Missouri River draining a wide area in northwestern South Dakota. Its length is about 180 miles. The name is a French one, signifying a dark horse or nosebag. On some maps the name Owl River is improperly given to this stream.

MORECAMBE, mōr'kām, England, a Lancashire seaside resort on Morecambe Bay, four miles by rail northwest of Lancaster. Its principal features are the promenade pier, three miles long, observation tower, winter garden, etc., and the fine beach of Morecambe Bay, this inlet of the Irish Sea being about 18 miles long and 10 miles broad. Pop. 19,000.

MOREEN. See MOIRE.

MOREHEAD CITY, mōr'hēd, town, North Carolina, in Carteret County, 33 miles southeast of New Bern. It is situated on the west shore of Beaufort Harbor at the north end of Bogue Sound, and is connected with the Atlantic Ocean by means of a four-mile channel through Beaufort Inlet. Its 1,000-foot pier is operated by the Morehead City Port Commission, and was constructed between 1935 and 1937. A new ocean terminal of the North Carolina State Ports Authority was being built in 1950, to supplement the existing shipping facilities, which, upon completion, will provide an additional 1,200-foot wharf, a transit shed, and two storage sheds.

Morehead City was founded in 1857, and incorporated three years later. Pop. (1950) 5,144.

MOREL. See FUNGI.

MOREL-LADEUIL, mō-rēl' lá-dū'y', **Léonard**, French sculptor and goldsmith: b. Clermont-Ferrand, France, 1824; d. Boulogne-sur-Mer, France, March 15, 1888. He studied art in Paris, and made his debut as an exhibitor at the Salon with his *Courage terrassant l'hydre de l'anarchie* in 1853. Six years later he went to Birmingham, England, where he was employed by the Messrs. Elkington, a firm of goldsmiths. Here he became known for his very beautiful *repoussé* work, and at the time of the Prince of Wales' marriage, the city of Birmingham purchased Morel-Ladeuil's plaque called *Dreams* for a wedding gift to the royal couple. Still another of his well known pieces presented to royalty, was his famous *Helicon* vase given to Queen Victoria on the occasion of her first jubilee.

MORELIA, mō-rā'lyā, city, Mexico, and capital of Michoacán state, is situated 130 miles west-northwest of Mexico City, on a fertile plateau, altitude 6,187 feet. It was founded in 1541 by the first viceroy of New Spain, Antonio de Mendoza, and was originally called Valladolid after the city of his birth in Spain. The city was renamed Morelia in 1828 in honor of José Morelos y Pavón (q.v.), priest and one of the early martyrs in Mexico's struggle for freedom from Spanish rule, who was born here. His enemy Agustín Iturbide (q.v.) was also a native.

Its chief products are corn, beans, sugar cane, fruit, and cattle. Among its industries are coffee processing, sugar refining, the extracting of vegetable oil, and the manufacture of shawls, hats, cotton goods, tobacco products, sweets, beer, chemicals, and resins.

The city is equipped with an airport, and modern radio stations. There are many fine old buildings. Pop. (1940) 44,304.

MORELL, George Webb, American soldier: b. Cooperstown, N. Y., Jan. 8, 1815; d. Scarborough, N. Y., Feb. 11, 1883. He was graduated from the West Point Military Academy in 1835, but resigned from the army two years later to become a civil engineer. He worked for three years in Michigan and in various Southern states on railroad construction, but in 1840 he settled in New York to study law. Admitted to the bar in 1842, he practiced law until 1861. During this period he served as commissioner of the United States Circuit Court for the Southern District of New York, from 1854 until the Civil War broke out, when he was made inspector general on the staff of the 1st Division,

New York State Militia, and accompanied it to Washington.

He was colonel on Gen. Robert Patterson's staff during the Shenandoah campaign, and was promoted to brigadier general, then to major general, commanding the 2d Brigade, 2d Division, Army Corps, to be given next command of a division. He commanded the supports of the celebrated battery of 100 guns at Malvern Hill, and was engaged at Hanover Court House, Mechanicsville, and Gaines' Mills.

During the Chickahominy campaign, he contracted a disease that was later to prove fatal. After being mustered out of the army on Dec. 15, 1864, he retired to his farm at Scarborough, and lived there until his death.

MORELLA, mō-rā'lyā, city, Spain, is situated in the Province of Castellón de la Plana, and is the principal town in the mountainous district of Maestrazgo. Originally founded by the Romans, the city became, in the Middle Ages, the stronghold of the kingdom of Valencia, and later played a prominent part in the Carlist wars.

In 1839, it was stormed by the Carlist general, Ramon Cabrera, who received for this victory the title of count of Morella. The city remained in Carlist hands until it was captured by Gen. Baldomero Espartero in 1840. Its modern industries consist of cotton textile factories, dyeing establishments, tanning, flour milling, and lumbering. It also raises cereals, almonds, and livestock. Pop. (1940) 2,466.

MORELLET, mō-rē-lé', **Andre**, French philosopher and writer: b. Lyon, France, March 7, 1727; d. Paris, France, Jan. 12, 1819. He studied under the Jesuits in Lyon, and then at the Sorbonne in Paris, after which he acted as tutor to a youth being sent by his family to Italy.

Morellet's growing interest in political economy was evidenced in his writings at this period in his life. They were eloquent, and possessed a keen and bitter wit rather than outstanding originality of thought. He was a personal friend of Voltaire, and a contributor to the famous *Encyclopédie* of Denis Diderot the French philosopher. He was elected to the French Academy in 1785, and seven years later, when the Academy was dissolved during the French Revolution, he managed to save its archives and the manuscript of the *Dictionnaire de l'Académie française* from the revolutionaries. He kept the valuable documents hidden until 1803 when the Academy was reorganized. It is interesting to note that 32 years afterward, Morellet was made one of the directors of this same *Dictionnaire* he had been instrumental in preserving.

MORELLI, mō-rē'lē', **Domenico**, Italian painter: b. Naples, Aug. 4, 1826; d. there, Aug. 13, 1901. He studied at Rome under Camillo Guerra and later was associated with the Realist leader, Felippo Palizzi.

His finest early works were *The Sicilian Vesper* and *Refugees from Aquileja*. He turned to religious subjects in 1867, of which his *Christ Walking on the Sea* and *The Descent from the Cross* are particularly well known. He painted the *Ascension of the Virgin* for the royal palace at Naples, and the results of a journey he took to the Orient were the paintings, *Street in Constantinople* and *Mohammed Before the Battle*. He was made a senator of the kingdom of Italy, and

became a director of the Institute of Fine Arts and the Museum of Applied Art in Naples.

MORELLI, Giovanni (pseudonym IVAN FERMOLIEV, lyér-mól'yěf), Italian art critic: b. Verona, Feb. 25, 1816; d. Milan, Feb. 28, 1891. He gained his education at Bergamo, and afterward at Aarau, Switzerland. He went next to Germany to study natural science in Munich, and while at the university there became interested in art. Returning to his native country in 1840, he associated himself whole-heartedly with the patriots who were trying to liberate Italy from Austrian domination. He took part in both the resurrection of Milan in 1848, and in that of Bergamo in 1866. He was elected deputy of the latter city (1860-1870), and in 1873 became a senator. While in this post he introduced the bill, bearing his name, which forbids the sale of works of art from public and religious institutions.

His treatises on art identification, which he usually signed with his pseudonym, were based on what were at that time new principles. He showed how paintings can be attributed to certain artists by observing the treatment of such details as hair, ears, fingers, etc. To this theory many experts—among them his main adversary, Friedrich Bode—opposed the objection that pupils of the old masters often employed the characteristics and mannerisms of their teachers. Of course, modern methods which use X-ray in examining paintings, have rendered Morelli's theories obsolete, replacing conjecture with scientific tests.

Morelli's major books are *Die Werke italienischer Meister in den Galerien von München, Dresden, und Berlin*, 3 vols. (1880), and *Kunst-erkenntnische Studien*, 3 vols. (1890-1893). The latter work was translated into English by Charles John Ffoulkes under the title *Italian Painters* (1892).

MORELOS, mō-rā'lōs, state, Mexico, lying to the south of the Federal District and the State of México. Its capital is Cuernavaca (q.v.), and it covers an area of 1,917 square miles. Situated on the south slopes of a large plateau with Popocatepetl to the northeast, the state is drained by small tributaries of the Rio de las Balsas. It is an agricultural region, producing corn, rice, sugar cane, wheat, coffee, tropical fruits and cattle. The climate ranges from semitropical to temperate. Pop. (1950) 268,863.

MORELOS Y PAVON, mō-rā'lōs è pā-von', José María, Mexican patriot and priest: b. Morelia (then Valladolid), Michoacán, Mexico, Sept. 30, 1765; d. near Mexico City, Mexico, Dec. 22, 1815. He had some Indian ancestry, and he worked for many years as a muleteer. At the age of 30, he entered the college of Valladolid (Morelia, q.v.) and was ordained to the priesthood three years later. From 1801 to 1810 he was in charge of the parishes of Carácuaro and Nocupétaro.

He joined, in 1810, the rebellion launched by Miguel Hidalgo y Costilla, who had been rector of the college of Valladolid during Morelos' student days.

After Hidalgo's death, he kept the cause alive in the north. His few followers soon became an army, and having defeated the Spaniards in several battles, he advanced upon Mexico City. He held Cuautla for 62 days against the famous siege by

the viceroy, finally effecting a skillful withdrawal of his forces. Later he captured Oaxaca (October 1812) and Acapulco (August 1813).

He was made captain general in November 1813 by the Congress convened at Chilpancingo. On Nov. 6, 1813, he proclaimed the independence of Mexico from Spain; after which he drafted a republican constitution for the newly freed country. In attempting to capture Valladolid, he was defeated by Augustín de Iturbide, and taken prisoner. He was shot as a traitor at San Cristóbal Ecatepec, and his remains now lie in the cathedral in Mexico City. The state of Morelos was so named in his honor.

MORENO, mō-rā'nō, Alfredo Baquerizo, bā-kā-rē'sō, Ecuadorian president and diplomat: b. Guayaquil, Ecuador, Sept. 29, 1859; d. New York, N. Y., March 29, 1951. He was graduated in law from the University of Quito, and began to practice his profession in 1884. From 1897 to 1901 he was a member of the Superior Court of Guayaquil.

He became minister of foreign relations in 1901-1902; and a year later was elected vice president of Ecuador. He was minister to the United States during President Theodore Roosevelt's administration, and was elected president of Ecuador in 1916, serving a four-year term. Again he occupied the presidency, from 1931-1932, being deposed from office during the latter year.

He was author of *Portas* (1882); and the novels *Titania* (1892); *El Señor Peneo* (1892); *Una Sonata en Prosa* (1894); *Evangelina* (1895); and *Luz* (1901).

MORESNET, mō-rēz-né', former neutral territory on the Belgian-German border, about 5 miles southwest of Aachen. The territory was under the protection of the signatories of the Vienna Congress (1815), and the citizens had a choice of military service with either the Belgian or the Prussian Army. Many of the inhabitants were French and Dutch, others Flemish and German.

Under the Treaty of Versailles, promulgated June 28, 1919, Belgium was awarded full sovereignty over the contested territory of Moresnet and over part of Prussian Moresnet. Pop. (1940) 6,385.

MORET, mō-ré', Alexandre, French Egyptologist: b. Aix-les-Bains, Province of Savoie, France, Sept. 19, 1868; d. Paris, France, Feb. 2, 1938. After passing the examination for the academic title of Agrégé in history and geography in 1893, he obtained his doctorate in 1903, and became director of Egyptological studies at the *École des Hautes Etudes* at the University of Paris, where he also lectured on Oriental history. Between 1906 and 1923 he was a director of the *Musée Guimet* in Paris, and professor of Egyptology at the *Collège de France*.

MORETO Y CAVANA, mō-rā'tō e kā-vā-nyā, Augustín, Spanish dramatist: b. Madrid, Spain, April 8, 1618; d. Toledo, Spain, Oct. 27, 1669. He graduated in law from the University of Alcalá, and upon his return home changed his profession and began writing plays. In Madrid he found a friend and patron in Pedro Calderón de la Barca. He was very prolific, turning out drama after drama until he finally passed the 100 mark before he had reached middle age.

His popularity was immense and he was rated as the equal, if not the superior, of Lope de Vega, by his admirers, among whom were the best critics of the day. Posterity, however, while recognizing the genius of Moreto and his valuable contributions to the Spanish drama, has not sustained this high verdict of his contemporaries. One reason is that Moreto was not original in the sense that Lope de Vega was. His dramas or *Comedias de capa y espada* (cloak and sword plays), while clever in themselves and instinct with the dramatic spirit, have more than an echo of Vega and Calderón, whom he frequently borrowed from and sometimes improved upon, as in *El Desdén con el Desdén*, which is generally considered to be his masterpiece. In addition to dramas of intrigue he also produced historical dramas and wrote considerable lyrical poetry and *autos sacramentales* (religious plays).

Moreto's incursion into the field of historical drama was probably occasioned by the decree of the Royal Council and Chamber of Castile which, in 1644, ordered that, in the future, the dramatists should turn their attention to historical drama and plays based on the lives of the saints. He found a new field in recasting old plays and making them conform to the requirements of the censor, who was, in reality, controlled by the church authorities who had dictated the new move for restricting the activities of the drama and the stage. Like Shakespeare, Moreto put so much of himself into this work of reconstruction that many of the new-made dramas were more deservedly his than the work of their first creators. He excelled in depicting human passions and feelings, among them all the shades of love, including undying passion, disdain, the suffering of unrequited love, jealousy, friendship, faithfulness, unfaithfulness, intrigue in love and in the ordinary affairs of life. In this field he led the way for that true and colorful character drawing in which the Spanish drama and novel have since shown such power and realism combined with idealism.

Moreto painted people of more refined feelings and higher position in life than did Lope de Vega, probably because he was better acquainted with upper-class society than was the older dramatist. The complicated complexion of Spanish court life with its intrigues, ambitions, plots, and insincerity is well pictured in his dramas. While he lacks invention and made use, without conscience, of his predecessors, he gave the Spanish drama characterization and artistic development that it had not previously possessed, and he polished his work as no Spanish dramatist had done before his day. He thus pointed the way to the successes that have, since his time, been achieved by dramatists and novelists in Spain. What he lacked in originality of invention he made up in his knowledge of the stage and in his ability to reconstruct the scenes and thoughts of others. His plots move along with rapidity, satisfactory development and wonderful management of dialogue which is ever fluid and graceful. He presents with great skill realistic pictures of the extravagances, customs, and vices of the life of his day, and he remains the greatest of the Spanish writers of character drama. In this field he shows his deep and wide knowledge of the world and his power to analyze characters and motives, passions and prejudices. Yet, on the whole, his plays are in better taste and superior in morality to those of his contemporaries. In

1659 he entered a monastery. Among his more notable plays, besides *El Desdén con el Desdén*, are *El lindo don Diego*, *El valiente justiciero*, *El ricohombre de Alcalá*, *El parecido en la Corte*, *Trampa adelante*, and *Primero es la honra*.

Consult volumes 39 and 58 of *Biblioteca de autores españoles* for articles on Moreto and the *autos sacramentales*; also Ticknor, George, *History of Spanish Literature* (New York 1849); Carrara, E., *Studio sul teatro ispano-veneto di Carlo Gozzi* (Cagliari 1901).

MORETON BAY, mōr't'n, Australia, southeast coast of Queensland, an inlet of the Pacific Ocean, 65 miles long, 20 miles wide. Moreton and Stradbroke islands form its eastern shore and the mainland its western shore. Brisbane River flows into it.

MORETON BAY CHESTNUT, or beay tree, *Castanospermum australe*, family Leguminosae, native to Australia. It grows 40 to 60 feet high, has very long pinnate leaves, bright yellow blossoms in long clusters, and bears large brown pods each having four or five chestnut like seeds which are edible when roasted. The timber called black bean wood, resembles walnut but is not durable.

MORETTO, II, ēl mō-rāt'tō (real name ALESSANDRO BONVICINO, or BUONVICINO), Italian painter: b. Brescia, Italy, about 1498; d. there 1554. He was a pupil of Floriano Feramola, too Titian as his model, and was also influenced by the work of Il Romanino (Girolamo Roman) and Gian Girolamo Savoldo. His pictures are distinguished for the beauty and nobility of the human figures, the serenity and balance of composition, and their color harmony, especially silvery gray tone. The Church of St. John the Evangelist at Brescia is a veritable gallery of his pictures. Others hang in leading European galleries, and the Metropolitan Museum, New York City, has his *Christ in the Desert* and *The Entombment of Christ*.

MOREY, mō'r'i, Samuel, American inventor: b. Hebron, Conn., Oct. 23, 1762; d. Fairlee Vt., April 17, 1843. Before he was four years old, his family moved to Orford, N. H., and he attended public school there. He entered the lumbering business, but also developed his considerable talent for mechanics and engineering and was engineer in charge of building the Connecticut River locks at Bellows Falls, Vt. He began experiments with steamboats about 1795. In 1793 he patented a steam-operated spit, and in the same year constructed a small craft propelled by a steam engine mounted on the bow which he demonstrated on the Connecticut River at Orford. On March 25, 1795, he received patent for a rotary steam engine. He also patented a windmill, a water wheel, and a steam pump.

In 1797, seeking capital for further experiments with steam engines, Morey went to Bordentown, N. J., where he built a side-wheel steamboat and demonstrated it successfully on the Delaware River. Failure of his financial backers, however, prevented further experiment at that time. He tried unsuccessfully to persuade Robert Fulton to adopt a model of his steamboat, and always believed that Fulton had appropriated his ideas. In 1805 and 1815 he obtained patents for steam engine improvements, and in 1820 constructed and operated on Fairlee Pond

(now Lake Morey) at Fairlee, Vt., a steamboat which he called *Aunt Sally*. On April 1, 1826, he obtained one of the first American patents for an internal combustion engine. He contributed articles on his work to *The American Journal of Science and Arts* edited by Prof. Benjamin Silliman of Yale.

MOREY, William Carey, American educator: b. North Attleboro, Mass., May 23, 1843; d. Rochester, N. Y., Jan. 21, 1925. At the outbreak of the Civil War, he left his studies at the University of Rochester to enter the Union Army as a volunteer, becoming brevet major and lieutenant colonel. Returning to the university after the war, he graduated in 1868, and in 1869 entered Rochester Theological Seminary. He was professor of history, English, and Latin at Kalamazoo College from 1870 to 1883, when he became professor of political science at the University of Rochester. He was organizer, trustee, and director of Reynolds Library there, 1884-1904. Among his many books on history and government were *Outlines of Ancient History* (1906), *The Study of Roman Law in Liberal Education* (1911), and *Ancient Peoples* (1915). He also wrote *Reminiscences of the "Pundit" Club* (1923), and numerous articles for magazines and reviews.

MOREY LETTER, The, in American political history, a forged letter used in the presidential campaign of 1880 to discredit the Republican candidate James A. Garfield. Published in the New York weekly *Truth* on Oct. 20, 1880, it purported to be a letter from Garfield to an H. L. Morey of Lynn, Mass., favoring free entry of cheap Oriental labor for work in American factories. Though instantly denounced as fraudulent, it caused Garfield the loss of five of the six electoral votes of California where the exclusion of Chinese and other Oriental labor was an issue.

MORF, môrf, Heinrich, Swiss philologist: Munchenbuchsee, Switzerland, Oct. 23, 1854; Thun, Jan. 23, 1921. He studied at the universities of Zurich and Strasbourg, and under Gaston Paris at the Collège de France in Paris, and at 25 was professor of Romance linguistics at Bern. He subsequently taught at Zurich (1889), Frankfurt-am-Main (1901), and Berlin (1910-1921). His works include *Geschichte der französischen Literatur im Zeitalter der Renaissance* (1898), considered a masterwork; *Aus Dichtung und Sprache der Romanen* (1903-1911); *Zur sprachlichen Gliederung Frankreichs* (1913).

MORFILL, môr'fil, William Richard, English Slavonic scholar: b. Maidstone, Kent, England, Nov. 17, 1834; d. Oxford, Nov. 9, 1909. He was educated at Oriel College, Oxford, where he later became university reader in Russian and, in 1900, professor of Russian and Slavonic. He wrote extensively on Slavic languages, literature, and history, and was the author of Polish, Serbian, Bulgarian, Russian, and Czech grammars.

MORFORD, môr'fêrd, Henry, American writer: b. New Monmouth, N. J., March 10, 1823; d. Aug. 4, 1881. In 1852 he founded the weekly New Jersey *Standard* at Middletown Point (now Matawan), and four years later went to New York, where he worked as a court clerk for a time and then on the editorial staff of the

New York *Atlas*. He made several trips abroad, and became known for his travel books and short-trip guidebooks to Europe and America. He also published several volumes of verse and three Civil War novels, and in January 1880 founded the *Brooklyn New Monthly Magazine* which he edited and published until March 1881.

MORGAGNI, môr-gă'nyê, Giovanni Battista or **Giambattista**, Italian anatomist: b. Forlì, Italy, May 25, 1682; d. Padua, Dec. 5, 1771. After graduating at the age of 14 from the academy in his native town, he spent 16 years in Bologna as the student, friend, and colleague of Antonio Maria Valsalva (illustrious pupil of Marcello Malpighi), lecturer in anatomy at the university. There he took degrees in philosophy and medicine at the age of 19. In 1710 he became professor of medicine at the University of Padua, and in 1715 professor of anatomy. His famous *Adversaria Anatomica* was published in 1706, and an enlarged version, *Adversaria Omnia*, in 1741. His greatest work, published in 1761, was *De Sedibus et Causis Morborum per Anatomem Indigatis* (*The Seats and Causes of Diseases Investigated by Anatomy*), which established pathological anatomy as a science and changed the course of medical diagnosis.

MORGAN, môr'gân, Arthur Ernest, American civil engineer: b. Cincinnati, Ohio, June 20, 1878. He attended high school in St. Cloud, Minn., and while working for his father as a surveyor, studied engineering at night. In 1902 he went into business for himself, specializing in flood control, and in 1907-1909 was supervising engineer for the United States Government Drainage Investigations. He was president of Antioch College, 1920-1936, and was the recipient of numerous honorary degrees from other colleges and universities. In 1933-1938 he was chairman of the Tennessee Valley Authority, but was dismissed by President Franklin D. Roosevelt for refusing to provide evidence to support his charges against other members of the commission. His numerous books include *My World* (1927), *The Long Road* (1936), *Nowhere Was Somewhere* (1946), *Industries for Small Communities* (1953).

MORGAN, Charles Hill, American inventor: b. Rochester, N. Y., Jan. 8, 1831; d. Worcester, Mass., Jan. 10, 1911. He left school at the age of 12 to go to work, and at 15 became an apprentice machinist in Clinton, Mass. He attended night school, and at 21 was an expert machinist and draftsman. From 1855 to 1860 he was draftsman for Erastus B. Bigelow, carpet manufacturer, and in 1860, in partnership with his brother, he opened a paper bag factory in Philadelphia, Pa. Here he invented an automatic bag-making machine. The business was sold profitably in 1864, and Morgan joined the Washburn & Moen Company, wire makers, in Worcester, Mass. While there, he perfected a power reel (with Fred H. Daniels), a continuous rolling mill, and automatic pouring and laying reels. He established the Morgan Spring Company, Worcester, in 1881, and in 1891 organized the Morgan Construction Company to produce rolling mill machinery. From 1887 until his death he was consulting engineer for the American Steel & Wire Company, and was a trustee of Worcester Polytechnic Institute from its founding.

MORGAN, Conwy Lloyd, British zoologist: b. London, 6 Feb. 1852. He was educated at the Royal Grammar School, Guildford, and Royal College of Science. From 1878-83 he was lecturer in English and physical science at the Diocesan College, Rondebosch, Capetown, then (1884) professor of zoology and geology at University College, Bristol, becoming principal (1887-1909). He was appointed vice-chancellor of the University of Bristol, but resigned after three months. He has written 'Animal biology' (1887); 'Animal Life and Intelligence' (1890); 'Introduction to Comparative Psychology' (1895); 'Spencer's Philosophy of Science' (1913); 'Emergent Evolution' (1923); 'Life, Mind and Spirit' (1926).

MORGAN, Daniel, American soldier: b. Hunterdon County, N. J., 1736; d. Winchester, Va., 6 July 1802. His early life was passed in obscurity and in 1753 he removed to Virginia where in 1755 he served under Braddock as a teamster. He was afterward engaged in Indian warfare and served in Pontiac's War and in Lord Dunmore's War. In 1775 he entered the army of the colonists and commanded a company of riflemen under Washington. He accompanied Arnold at Quebec in 1775 and rendered gallant service there but was captured by the British and not exchanged until nearly a year afterward. He was then given command of a Virginia regiment with the rank of colonel, and in the campaign against Burgoyne took a prominent part; but his services not being recognized by Congress, he resigned. In 1780 he returned to the service as brigadier-general under Gates, and under General Greene who succeeded Gates. Morgan won a brilliant victory over Tarleton at Cowpens, which was recognized by a gold medal from Congress. His subsequent movements were of serious annoyance to Cornwallis, but in 1781 he resigned from the army owing to ill health. In 1794 he returned to it as major-general and helped to crush the Whisky Insurrection, and from 1795-99 was a member of Congress. Consult Graham, 'Life of General Daniel Morgan of the Virginia Line' (1856); McConkey, 'The Hero of Cowpens' (2d ed., 1885).

MORGAN, Edwin Dennison, American politician: b. Washington, Mass., 8 Feb. 1811; d. New York, 14 Feb. 1883. He was educated in the public schools, at 17 entered the store of his uncle in Hartford, Conn., and three years later was made a partner in the business. In 1836 he removed to New York and engaged in the grocery business. During the cholera visitation of 1849 he rendered devoted service. Elected to the State senate in 1850, he continued in that office until 1858, when he was elected governor of the State and served until 1862. His administration during those trying times being marked by great sagacity and patriotism. About 223,000 troops were raised for the Federals; New York's firm attitude during the war being in large measure due to Governor Morgan's influence. In 1862 he was elected to the United States Senate; in 1865 he declined the secretaryship of the treasury offered him by President Lincoln, and again refused it under Arthur. He served in the Senate until 1869, and though still taking an active interest in politics held no further political office excepting that of chairman of the Republican

committee which conducted the presidential campaign of General Grant in 1872. He was connected with numerous great financial enterprises during the last years of his life and was a generous benefactor to education, notably to the New York Theological Seminary and Williams College.

MORGAN, Edwin Vernon, American diplomatist: b. Aurora, N. Y., 22 Feb. 1865. He graduated (1890) at Harvard University and studied (1891-92, 1894-95) at the Berlin University. He was appointed assistant in history (1892-94) at Harvard and instructor in history (1895-98) at Adelbert College, Cleveland. In 1899 he was appointed secretary to the Samoan Commission, and (1900) secretary of legation at Seoul, Korea. He served as second secretary of the embassy, Saint Petersburg (1901); and as consul at Dalny, Manchuria (1904); Minister Plenipotentiary to Korea (1905), filling the same diplomatic position at Cuba (1905-10), then Uruguay, Paraguay (1910-11), and Portugal (1911-12). He was made Ambassador Extraordinary and Plenipotentiary at Brazil 1912. Died Brazil, 16 Apr. 1934.

MORGAN, George Campbell, Anglo-American clergyman: b. Tetbury, Gloucestershire, 9 Dec. 1863. He was educated at the Cheltenham Douglas School, became master in the Jewish Collegiate School, Birmingham (1883-86); then mission preacher (1886-88), to be ordained (1889) to the Congregational ministry. He served as pastor at Stone, Staffordshire (1889-91); Rugely (1891-93); Westminster Road, Birmingham (1893-97); New Court Chapel, London (1897-1901); Westminster Chapel (1904-17); Tabernacle Presbyterian, Philadelphia (1929-); lecturer in the United States since 1919. He wrote 'The Analyzed Bible' (10 vols. 1910); 'Evangelism'; 'The Life of the Christian' (1904); 'God, Humanity and War' (1914); 'The Ministry of the World' (1919); 'Acts of the Apostles' (1924). He edited the *Westminster Bible Record*, Westminster Pulpit.

MORGAN, Sir George Osborne, English politician: b. Gothenburg, Sweden, 8 May 1826; d. 1897. He was graduated at Oxford in 1848 and was admitted to the bar in 1853. In 1868 he became a member of the House of Commons and was a staunch supporter of various reform movements, particularly those concerning the English land laws, Welsh disestablishment and education. He was appointed judge-advocate-general in Gladstone's ministry in 1880 and carried through legislation abolishing flogging in the army; and in 1886 was Under-Secretary for the Colonies. He was created a baronet in 1892 and was leader of the Welsh party in the House of Commons until his death. He was the author of a work on 'Chancery Acts and Orders' (1858).

MORGAN, George Washbourne, American organist: b. Gloucester, England, 9 April 1822; d. Tacoma, Wash., 10 July 1892. When he was eight he played the entire service at Saint Nicholas' Church in Gloucester, and at 12 became assistant organist at the cathedral there. He removed in 1853 to New York where he was organist in several leading churches, and gave recitals in different cities of the United States with marked success. He conducted an annual Lenten service in Chicker-

ing Hall, New York, after 1880, and was the author of an Episcopal service, and numerous compositions.

MORGAN, George Washington, American soldier: b. Washington County, Pa., 20 Sept. 1820; d. Old Point Comfort, Va., 26 July 1893. He left college in 1836 to enlist in the Texas army and fought for the independence of that country as lieutenant and then as captain when he resigned and in 1841 entered West Point. In 1843 he left the academy to study law and established a law practice at Mount Vernon, Ohio, in 1845. When the Mexican War broke out he became colonel and served under General Scott with distinction, becoming brevet brigadier-general. He returned to his law practice and in 1856 was sent as United States consul to Marseilles; in 1858 he went from there to Portugal Minister where he remained until 1861. He entered the army immediately upon his return to the United States and as brigadier-general was given a command under General Buell. In 1862 he took command of a division of the Army of Ohio, later was with Sherman at Vicksburg and held the command at the capture of Fort Hindman, Ark. He resigned in 1863 on account of failing health. He was a member of Congress from 1869 to 1873.

MORGAN, Sir Henry John, Welsh buccannier, lieutenant-governor of Jamaica: b. Llanrhynny, Glamorganshire, about 1635; d. Jamaica, 1688. While a boy he was kidnapped at Bristol and sold at Barbados. Just when he joined the Jamaica buccaneers is uncertain, as there were several Morgans in the marine at Jamaica at the time, but he may have commanded his own ship as early as 1663; a Captain Morgan who sailed from Jamaica in that year taking part in the sack of Vildemos, Truxillo and Granada (1665-66). In 1666 Morgan sailed under Mansfield to capture Curaçao, and was chosen admiral after Mansfield's death at the hands of the Spaniards. In 1668 he captured Puerto Principe in order to get information of Spanish plans for an attack on Jamaica; then took Porto Bello, Panama, after a sharp siege during which the buccaneers planted scaling ladders under the cover of captured priests and nuns, sacked the city and tortured and maltreated its inhabitants; and in the end of the summer again ravaged Cuba. The next year, 1669, saw Morgan's attack on Maracaibo, followed by fresh outrages. The arrival of three Spanish warships did not check Morgan's success, for he set fire to one ship, captured another and forced the Spaniards to beach and burn the third; he killed almost all his prisoners, recovered 15,000 pieces of eight from the sunken ship, got a ransom for the city from the Spanish forces in the fort and by a clever manoeuvre made his escape. Returning to Jamaica he was first reproved for exceeding his powers and then made commander-in-chief of the entire naval force of Jamaica, so that in 1671, with a stronger force under him than before, he approached the city of Panama, which he captured after a thrilling battle, in which the Spanish cavalry was broken by riding into a swamp, and further execution was done by a herd of cattle which the Spaniards intended should break the English ranks but which stampeded the Spanish. This attack and the

capture of Panama occurred some time later than the signature of peace between England and Spain, and in consequence Morgan was ordered to England for trial in 1672. Nothing serious came of this, however, possibly because Morgan made free use of his wealth in England. In November 1674 he held a commission as lieutenant-governor of Jamaica. He can hardly be called a pirate; his cruel, brutal methods were those of his enemies and England's enemies. The primary source for Morgan's life is Exquemeling, 'Buccaneers of America' (1684), the work of one of Morgan's followers and reprinted in the 'Adventure Series' (London 1891). Professor J. K. Laughton in the 'Dictionary of National Biography' (Vol. XXXIX, 1894), first set straight the chronology of Morgan's life. Popular accounts are Hutcheson, 'Sir Henry Morgan' (1890); Pyle, 'Buccaneers of America' (1891); Stockton, 'Buccaneers and Pirates of Our Coast' (1898); and Brady, 'Sir Henry Morgan,' a romance (1902).

MORGAN, James Appleton, American lawyer and author: b. Portland, Me., 2 Oct. 1850. He was graduated at Racine College, Wisconsin, in 1867, and at the Columbia Law School in 1869, and in 1871 began the practice of law in New York City, becoming professionally associated with railroad interests. In 1885 he founded the Shakespeare Society of New York, of which until 1910 he was president. His view of the First Folio of 1623 is that the plays as therein printed are not monographs almost solely attributable to Shakespeare, but "growths" embodying "improvements," alterations and expressions by many hands; and the society's publication, the 'Bankside Edition of Shakespeare' (22 vols., 1888-1906), edited by him contains the earliest players' rendering printed in parallel columns with the First Folio. His writings include 'Macaronic Poetry' (1870); 'The Law of Literature' (1874); 'Legal Maxims' (1877); 'The Shakespearean Myth' (1880); 'Shakespeare in Fact and Criticism' (1884); 'Some Shakespearean Commentators' (1885); 'Digest Shakespeareana' (1887); 'The People and the Railways' (1888); and 'The Society and the Fad' (1890); 'Bankside Restoration Shakespeare' (5 vols., 1905-08). Died New York, 15 Aug. 1928.

MORGAN, John, American physician: b. Philadelphia, 10 June 1735; d. Philadelphia, 15 Oct. 1789. He was graduated (1751) at the College of Philadelphia (now known as the University of Pennsylvania) and served an apprenticeship in medicine under Dr. John Redman. He entered the provincial army as surgeon and lieutenant, resigning his commission to continue (1760) his medical studies in London and Edinburgh, receiving the degree of M.D. 1763. During a visit to Paris he was made member of the Academy of Surgery for clever anatomical preparation of a kidney. In Italy he was made member of the Society of Belles-Lettres, Rome, and on his return to London was elected Fellow of the Royal Society and licentiate of the Colleges of Physicians of both London and Edinburgh. Returning (1765) to Philadelphia he laid the plan for establishing a medical school in that city, which he had formulated, at the request of the trustees of the College of Philadelphia. The plan

adopted, he was elected professor of the theory and practice of medicine, and, three years later, five young men received medical degrees—the first conferred in America. In 1775 he was appointed by Congress director-general and physician-in-chief to the general hospital of the American army, and reorganized the hospitals of the army. But lack of supplies for the sick and wounded made his energetic efforts largely ineffective and complaints to Washington caused Congress (1777) to dismiss him without reason. A committee of that body, however, after an investigation, honorably acquitted him of blame, while Washington wrote him: "No fault could be found with the economy of the hospitals during your directorship." He wrote 'A Discourse on the Introduction of Medical Schools in America' (1765), and his dissertation 'The Reciprocal Advantages of a Perpetual Union between Great Britain and her American Colonies' (1766) won him a gold medal from England.

MORGAN, John Hartman, British publicist and educator: b. 20 March 1876. He was educated at Caterham School, studied at University College of South Wales, Balliol College, Oxford, and University of Berlin. From 1901-03 he was on the literary staff of the *Daily Chronicle*, became editorial writer on the *Manchester Guardian* (1904-05), and London University Extension lecturer. He has been professor of constitutional law at London University College since 1908. He was Home Office Commissioner with the British Expeditionary Forces and Staff Captain on the Adjutant General's staff (1914-15); and Deputy Adjutant General on the Inter-Allied Military Commission of Control in Germany (1919-23). He wrote 'The House of Lords and the Constitution' (1910); 'The New Irish Constitution' (1912); 'The German War Book' (1915); 'German Atrocities: An Official Investigation' (1916); 'The Present State of Germany' (1924); 'Remedies Against the Crown' (1925).

MORGAN, John Hunt, Confederate general: b. Huntsville, Ala., 1 June 1826; d. New Greenville, Tenn., 4 Sept. 1864. His boyhood was spent in Lexington, Ky., where he was later a manufacturer of bagging. He served through the Mexican War as lieutenant of cavalry. At the outbreak of the Civil War he, with 200 men of the local militia, made for the Confederate lines, and he was appointed a captain of volunteers. Soon discovering that he could best serve the Confederacy by adopting guerrilla methods of warfare he began the series of raids which so annoyed the Union commander. Moving with great celerity, and accompanied by his own telegraph operator, he kept himself acquainted with the plans of the enemy while he misled them regarding his own position. As the result, bridges which they expected to cross were burned, much-needed supply trains were captured and railroad tracks were destroyed. In 1862 he was rewarded by appointment as major-general. In 1863 he projected an extended raid through Kentucky, Ohio and Indiana, but was captured and, with many companions, imprisoned in the Ohio Penitentiary. Escaping, he again attempted a raid but, while sleeping at a farmhouse near Greenville, Tenn., he was surrounded by National

troops under Gen. Alvin C. Gillem, and upon attempting to escape was killed. See **MORGAN'S RAID INTO INDIANA AND OHIO**.

MORGAN, John Livingston Rutgers, American chemist: b. New Brunswick, N. J., 27 June 1872. He was graduated (1892) at Rutgers College, received Ph.D. diploma at University of Leipzig (1895) and was appointed assistant in chemistry at Stevens Institute (1895-96). He became instructor of quantitative analysis at Brooklyn Polytechnic Institute (1896-97). He served at Columbia University as tutor of chemical physics and chemical philosophy (1897-1901), professor of physical chemistry (1901-05) and as professor after 1905. He wrote 'The Principles of Mathematical Chemistry' from Helms' German work (1897); 'The Theory of Solution and its results' (1897); 'Elements of Physical Chemistry' (5th ed. 1914); 'Physical Chemistry for Electrical Engineers' (2d ed., 1909). He died, New York City, 13 Apr. 1935.

MORGAN, J(ohn) Pierpont, American financier: b. Hartford, Conn., 17 April 1837; d. Rome, Italy, 31 March 1913. He was the son of J. S. Morgan (q.v.). He was educated at the English High School in Boston and at the University of Göttingen, Germany. He began his business career in the banking house of Duncan, Sherman & Co., New York City; in 1860 he became agent and attorney in the United States for George Peabody & Co. of London; in 1864 junior member of the banking firm of Dabney, Morgan & Co., and later member of the firm of Drexel, Morgan & Co., of which his father was also a partner. By the death of the older members of the firm he became the head of the latter house and the firm name was changed to J. P. Morgan & Co. He also controlled the firm of J. S. Morgan & Co. of London and had partnership interest in Drexel & Co. of Philadelphia. For many years his chief interest lay in railroad negotiations and combinations, and he gradually gained control of the New York Central system, the New York, New Haven and Hartford, the Reading, the Erie, the Lehigh Valley, the Southern, the Northern Pacific, the Big Four and the Chesapeake and Ohio. Shortly after this great railroad consolidation was completed (1901), he succeeded in organizing the "United States Steel Company," uniting the Carnegie Steel Works and other large concerns with a capitalization of \$1,100,000,000, and dominating the steel industry of the United States. In the same year he bought up a large English shipping line with the evident design of organizing a trust for the control of transatlantic shipping, but did not succeed in completing the consolidation. He was the head of both the anthracite and the soft coal trusts, and was several times prominent in the settlement of miners' strikes. In 1895 he organized the syndicate which floated the United States bond issue of \$62,000,000, for the increase of the gold reserve; and in 1901 secured American subscriptions of \$50,000,000 to the British war loan. In 1912 he testified before the Pujo Banking Committee in Washington, appointed by the House of Representatives to investigate the alleged "Money Trust." Probably no other American capitalist was so well known and so thorough

trusted in Europe as Mr. Morgan; particularly was this true as regards England, and a large majority of English investments in American securities were made through his house; everywhere he was recognized, not merely as a man of vast wealth, but also as a man of unusual organizing and constructive ability. He gave largely to many charities and institutions, particularly to hospitals, churches and the Trade School in New York, and to Harvard University. He was an enthusiastic yachtsman, was for two years commodore of the New York Yacht Club and built the yacht *Columbia*, which defeated Sir Thomas Lipton's *Shamrock* in the international yacht races. Mr. Morgan was the greatest art collector of his time, his collections being among the most varied and important ever owned by an individual. The historic and romantic aspects of art appealed more strongly to him than the purely aesthetic. He built a beautiful library adjoining his home, wherein he housed a collection of important manuscripts and rare and handsomely-bound books. The Metropolitan Museum of Art in 1913 exhibited most of his collections. Thirteen galleries were needed to house the many rare specimens of Byzantine and Gothic enamels and ivories, bronzes and marbles of the Renaissance, metal work, crystals, Flemish tapestries, a great collection of miniatures and paintings by artists of the first rank. His collection of porcelains, French furniture and objects of decorative art and the paintings of the celebrated Fragonard room were sold by his son in 1915. Mr. Morgan published elaborate catalogs of nearly all of his collections. Consult the catalogs published by the New York Museum of Art (1914), and for much valuable material on Mr. Morgan's career as financier, art collector and philanthropist, consult the New York *Evening Post* of 31 March 1913.

MORGAN, J(ohn) Pierpont, American financier, son of John Pierpont Morgan (1837-1913); b. Irvington, N. Y., 7 Sept. 1867; d. Boca Grande, Fla., 13 March 1943. He was graduated from Harvard University in 1889; was made a partner in J. P. Morgan & Co. in 1891; and soon afterward entered its London branch. He returned to the United States in 1901, and succeeded his father as head of J. P. Morgan & Co., upon the latter's death in 1913. He inherited the greater portion of his father's fortune, valued at \$78,000,000, and succeeded to the directorates of many corporations in which the house of Morgan held large financial interests, including that of the United States Steel Corporation, of which he was chairman of the board until 1932, and a director until his death. In January 1915, following the outbreak of the First World War, the house of Morgan was appointed commercial agent for the British Government in the United States, and subsequently purchased all munitions and supplies for the Entente in this country, totaling in cost several billions of dollars. On 1 July 1915 at Glen Cove, L. I., Mr. Morgan was shot by a fanatic, but escaped with minor injuries. The banking act of 1933 restricted bank dealings in securities, and forced Morgan & Co. to choose between surrendering its security business, the largest in the world, and its private deposit banking business. It gave up the security business, turning it over to the new firm of

Stanley Morgan & Co., Inc., of which Mr. Morgan's son, Henry S. Morgan, became treasurer. On 1 April 1940, the name of the banking house was changed to J. P. Morgan & Co., Inc., and Mr. Morgan became chairman of the board. At that time the bank had deposits of over \$600,000,000. As head of J. P. Morgan & Co., Mr. Morgan surrounded himself with many of the ablest financiers in the country. Throughout his career Mr. Morgan shunned publicity. He was nevertheless very human towards his friends, and a liberal contributor to charitable causes. He had been decorated by many foreign governments, and was a trustee of the Metropolitan Museum of Art, New York Public Library, Cooper Union, and a member of the joint administrative board of the New York Hospital and Cornell Medical College.

MORGAN, John Tyler, American lawyer and politician; b. Athens, Tenn., 20 June 1824; d. Washington, D. C., 11 June 1907. He went to Alabama when nine years old, received his education there, was admitted to the bar in 1845 and commenced practice. He rapidly gained a high reputation as a lawyer and speaker; was presidential elector in 1860, voting for Breckenridge, and in 1861 was a delegate to the Alabama convention which declared for secession. He enlisted in the Confederate army as a private in 1861; in 1862 raised a regiment in his state, of which he was made colonel; and in 1863 was commissioned brigadier-general and commanded a division under General Johnston. After the war he resumed the practice of law at Selma, Ala.; was presidential elector on the Democratic ticket in 1876, and sat in the United States Senate from 1877 until his death. He was long recognized as one of the ablest leaders of the Democrats in the Senate, was a member of the Senate Committee on Foreign Relations and for some years its chairman; in his last term he was chairman of the Committee on Inter-oceanic Canals and, favoring in that capacity the Nicaragua Canal route instead of the Panama, was removed from his post in November 1903. He was an earnest and able advocate of recognition of Cuban independence, and won popularity in all parts of the country by his eloquent speeches in behalf of Cuba. In 1892 he was a member of the board of arbitration on the Bering Sea Fisheries, and in 1898 was one of the commission appointed to prepare a system of laws and organize the government for the Hawaiian Islands.

MORGAN, Junius Spencer, American financier; b. West Springfield (now Holyoke), Mass., 14 April 1813; d. Monte Carlo, Monaco, 8 April 1890. He entered a dry-goods store when a boy and remained there until he came of age, when he was engaged for 18 months in banking in New York. He returned to the dry-goods business in Hartford, Conn., where he was junior partner in a leading firm and rapidly advanced until he formed a partnership under the name of J. M. Beebe, Morgan & Co., which became one of the largest dry-goods establishments in the United States. In 1854 he became a member of the banking house of George Peabody & Co., in London, which subsequently became J. S. Morgan & Co., and was ranked among the world's greatest banking

houses. He was a generous benefactor of various public and private institutions, among them being Trinity College, Hartford, and the Hartford Orphan Asylum. He established a public library in Hartford and made valuable donations to the Metropolitan Museum of Art, Yale College and other institutions.

MORGAN, Lewis Henry, American archaeologist and anthropologist: b. Aurora, N. Y., 21 Nov. 1818; d. Rochester, N. Y., 17 Dec. 1881. He was graduated at Union College in 1840, practised law at Rochester in 1844-64 and served in the State assembly (1861) and senate (1868-69). His enduring fame rests on his researches in the history and customs of the American Indians. In his labors he received the aid of the Smithsonian Institution and the United States government. He spent much of his time among the tribes and was regularly admitted into the Senecas. His earliest work, 'The League of the Iroquois' (1851; new ed., 1904), was the first scientific account of the organization and government of an Indian tribe; but even more valuable are his 'Systems of Consanguinity and Affinity of the Human Family' (1869) and his treatise on 'Ancient Society' (1877), each based on the same material, the former being a collection of facts, the latter a philosophical treatise. He also published 'The American Beaver' (1868) and 'Houses and House-life of the American Aborigines' (1881). In 1875 he was elected to the National Academy of Sciences and 1879 was president of the American Association for the Advancement of Science. He bequeathed \$80,000 to found a woman's college at the University of Rochester.

MORGAN, Matthew Somerville, American artist: b. London, 27 April 1839; d. New York, 2 June 1890. He studied scene painting, but soon abandoned it to become correspondent and illustrator for the *London News*, afterward studying in Paris, Italy and Spain, and in 1858 penetrated the interior of Africa on a sketching tour. Returning to London he became joint editor and proprietor of the *Tomahawk*, and his cartoons, which audaciously attacked the aristocracy and royalty, brought him into disfavor. He assisted in the establishment of the *London Fun*, and in 1870 removed to the United States, where he was engaged with Frank Leslie. He managed several theatres in New York, managed the Strobbridge-Lithograph Company of Cincinnati in 1878-85, and founded in that city the Matt Morgan Pottery Company and the Art Students' League.

MORGAN, Morris Hickey, American classical scholar: b. Providence, R. I., 8 Feb. 1859; d. 1910. He was graduated (1881) at Harvard, receiving (1887) the degree Ph.D. He held the chair of classical philosophy at Harvard. He wrote 'De Ignis Eliciendi Modis apud Antiquos' (1890); 'Dictionary to Xenophon's Anabasis' (1892); 'A School Latin Grammar' (1899); 'The Minor Works of Tacitus' (1904); 'The Language of Vitruvius' (1906). Among his published translations are 'Xenophon's Art of Horsemanship' (1893); 'Bibliography of Persius' (1893); 'The Phormio of Terence' (1895); 'Eight Orations of Lysias' (1895). Numerous essays and reviews from his pen have been published in the contemporary philological periodicals.

MORGAN, Sydney Owenson, Lady, Irish novelist: b. Dublin, Ireland, about 1783; d. London, 14 April 1859. Her father was an actor on the Dublin stage, of the name of Mac Owen, afterward changed to Owenson. She was a governess for a time. Her first literary effort was a volume of poems (1801), followed by a collection of Irish songs and two novels, 'Saint Clair' and the 'Novice of Saint Dominick' (1804). In 1806 appeared her 'Wild Irish Girl,' a novel which, avowedly nationalistic in sympathy and containing good descriptive passages, established her reputation, became immediately popular and secured for her a high position in fashionable and literary life. She had by this time removed from Dublin to London, and in 1812 was married to Sir Charles Morgan, an eminent physician. She also contributed English words to be set to Irish airs. In 1837 she received a civil list pension of £300 a year, the first woman author to be so rewarded. Her style was inflated and gushing, her vanity was inordinate; but she drew many vivid characterizations of Irish character. Among her other works are novels 'O'Donnell'; 'Florence McCarthy'; and 'The O'Briens and The O'Flahertys'; the 'Life and Times of Salvator Rosa'; 'Woman and her Master'; and 'Passages from my Autobiography.' Consult Fitzpatrick, W. J., 'Lady Morgan' (London 1860).

MORGAN, Tali Esen, American choral conductor: b. Llangynwyd, Wales, 28 Oct. 1858. He studied music and came (1876) to Scranton, Pa., where he published the *Cambro-American* in 1897. For 17 years he conducted the summer music festivals at Ocean Grove, N. J., later becoming director of the New York Festival Chorus. He was founder and president of the International Correspondence School of Music. He also founded the National Association of Organists and the Musicians Club of New York, and published a course of music instruction for teachers. D. 30 June 1941.

MORGAN, Thomas Hunt, American zoologist: b. Lexington, Ky., 25 Sept. 1866. He was graduated (1886) at the State College of Kentucky, took the degree Ph.D. (1890) at Johns Hopkins and became professor of biology at Bryn Mawr (1891-1904). He was professor of experimental zoology at Columbia University (1904-28), and biological authority at the California Institute of Technology after 1928. In 1939 he was awarded the Copley Medal for his development of the study of genetics, by the Royal Society of London. He received many honorary degrees. His publications include: 'Development of the Frog's Egg' (1897); 'Regeneration' (1901); 'Evolution and Adaptation' (1903); 'Heredity and Sex' (1913); 'Critique of the Theory of Evolution' (1916); 'Physical Basis of Heredity' (1919); 'Theory of the Gene' (1926); 'Embryology and Genetics' (1933). He died at Pasadena, Calif., 4 Dec. 1945.

MORGAN, William, American Freemason, whose death was the immediate cause of the formation of the Anti-Masonic party: b. Culpeper County, Va., about 1775; d. possibly near Niagara in 1826. He fought in the defense of New Orleans in 1815; removed to York, Canada, in 1821, where he became a brewer, and whence soon after he moved to Batavia, N. Y.; and in August 1826 disappeared soon after a

rumor had been spread that he was to reveal in a book the secrets of the Masonic Order. He was supposed to have been abducted by fellow-Masons and drowned in Lake Ontario, but his death was never proved. A corpse found near the mouth of Niagara River was stated to be his, and as such was claimed by his family, but disinterred and believed to be some one else. Much political capital was made of the alleged abduction and drowning and it was averred that Thurlow Weed, a leader in the antimasonic movement (see *ANTIMASONRY*), cynically said that it was "a good enough Morgan till after election," a remark that has become proverbial for campaign deceit.

Morgan's book *Illustrations of Freemasonry, or One of the Fraternity Who Has Devoted Thirty Years to the Subject* (1826) roused much less excitement than the story of his death. This work under the title *Free Masonry Exposed and Explained* was reprinted in 1912.

MORGAN, Fort. See FORT GAINES AND FORT MORGAN.

MORGAN CITY, city, Louisiana, in St. Mary Parish, at an altitude of six feet, situated on Berwick Bay on the navigable Atchafalaya River, 53 miles south of Baton Rouge, and served by the Southern Pacific Railway. One of the busier ports of southern Louisiana, it has water connections with the Mississippi and westward in to Texas via the Intracoastal Canal, which here joins the Plaquemine-Morgan City Waterway leading to the Gulf of Mexico. The port handles petroleum, chemicals, steel and iron products, oystershells, sulphur, and lumber. The packing of sea food provides employment for a large number of workers. Sugar cane, corn, rice, and cotton are grown in the surrounding region and are traded through the city. There is extensive fur trapping nearby, mainly of muskrat, mink, and otter, and the surrounding area is also a paradise for hunters and fishermen. The city maintains a modern library, good schools, churches, and a hospital.

History.—Settled in 1850, the city was incorporated as Brashear City in 1860, but the name was changed in 1876 in honor of Charles Morgan (1795-1878), a steamship-line owner. In 1863 the city, held by Union forces, was taken by the Confederates, but was soon abandoned by them and reoccupied by the Federals. Pop. (1950) 9,759.

MORGANATIC MARRIAGE, a marriage between a prince or noble and a woman of inferior rank in cases where a perfect marriage is not legal except with a woman of equal rank. The distinctive feature of the morganatic marriage is that the wife does not acquire the rank of the husband, and the children, legitimate though they are, do not inherit it; in some states they do not inherit either entailed estates or personality.

In Great Britain under the Royal Marriages Act (1772) such a marriage is invalid in public law. A morganatic marriage and a regular marriage cannot exist at the same time, so that the Roman Catholic Church regards the morganatic marriage as a perfect one. The custom originated in ancient German law, is prevalent among the nobles and high nobility of that country and is in force among the royal families of Europe.

MORGANFIELD, mór'gân-fēld, city, Kentucky, seat of Union County, at an altitude of 439 feet, 22 miles west-southwest of Henderson, and served by the Illinois Central Railroad. In an agricultural and coal mining region, there is also extensive livestock raising. The town is a railroad shipping point for tobacco, corn, wheat, and clover, and has flour mills, a seed-cleaning plant, and manufactures of furniture and metal products. There are also large oil fields nearby. St. Vincent's Academy (1820) for girls and Camp Breckinridge, an army camp active during World War II, are nearby. The waterworks are city owned and operated. Pop. (1950) 3,257.

MORGAN'S RAIDS INTO INDIANA AND OHIO.

In the middle of June 1863 Gen. Braxton Bragg ordered Gen. John H. Morgan, with 2,000 picked mounted infantry and four guns to move from Tennessee into Kentucky, break up the railroad upon which Gen. William S. Rosecrans depended for supplies, capture Louisville, destroy the public works and return to Tennessee as quickly as possible. Morgan determined to exceed his orders and make a raid north of the Ohio. On July 2, with 2,460 men and four guns, he set out from Burkesville, crossed the Kentucky River in the face of Union troops guarding it, and marched northward, followed by all the Union detachments within immediate call. He passed through Columbia, after a sharp skirmish with about 300 Wolford's Kentucky cavalry, in which he lost about 40 in killed and wounded, and on the 4th reached Green River at Tebb's Bend, and demanded the surrender of Col. O. H. Moore, who, with about 300 men of the 25th Michigan, was guarding the bridge at that point. Moore replied that the Fourth of July was not a good day to surrender, and was instantly attacked with artillery and musketry. After a hard fight of three hours, in which Moore had six killed and 23 wounded, Morgan was repulsed, with a loss of 36 killed and 46 wounded, and drew off, crossing the river below the bridge. On the 5th he defeated and captured the small garrison of Lebanon and marched by Bardstown to Brandenburg, on the Ohio, where he arrived on the morning of the 8th, and seizing two steamboats began crossing his command. His passage was disputed by a gunboat and by militia with a field-piece on the Indiana shore, but by the morning of the 9th his whole command was in Indiana. Twenty-four hours later Gen. Edward H. Hobson, with 2,500 cavalry and mounted infantry and four guns, crossed the river in pursuit, and for 17 days hung upon Morgan's heels. Indiana and Ohio were aroused and turned out their militia by thousands.

After crossing the Ohio, Morgan rode north through Corydon, where he was resisted by militia, who were soon overpowered. He then pushed on to Salem, where he captured nearly 400 militia, then through Lexington and Paris to Vernon, near which place on the evening of the 11th he encountered a stiff resistance from about 1,200 militia under Colonel Love. Under cover of darkness he withdrew from Love's front, and pressing on through Dupont and Sumansville, crossed the Indiana line on the 13th to Harrison, Ohio, and concentrated his command preparatory to making his way across the Ohio into Kentucky, detaching parties to burn bridges and confuse the pursuit, and impressing fresh horses. Under cover of a feint on Hamilton he

marched by night a few miles north of Cincinnati, moving directly east, closely pursued next day by Hobson, who was marching 40 miles a day, and threatened from all directions by the militia. Turning toward Berlin, where the government had a large number of animals, he was confronted by a small body of militia under Colonel Runkle, lost much precious time in threatening an attack, drew off closely followed by Runkle, and after dark of the 18th reached the banks of the Ohio, a short distance above Pomeroy, near Buffington Bar and Blennerhassett's Island, where from the first he had planned to escape. His pursuers were closing in on him from every direction. On the west Hobson was hanging on his rear; General Judah, who had been withdrawn from Kentucky, had landed his division at Portsmouth, and was marching up from the southwest; regiments were coming down the river from Parkersburg; and gunboats patrolled the river and watched the fords. Early in the morning of the 19th Morgan endeavored to cross the river, but was speedily checked. He was attacked in rear by the head of Hobson's column, Judah's cavalry struck him in flank and two gunboats opened upon his front. A severe engagement cost him about 120 killed and wounded, and more than 700 of his officers and men surrendered. Morgan with the remainder escaped up the river, where he attempted to cross to Belleville by swimming his horses.

Three hundred men, under Col. B. R. Johnson, had crossed when a gunboat stopped the remainder of the column, Morgan himself returning to the Ohio shore and with about 800 men retreating inland. He had lost all his artillery and trains. He pressed on northeast through Athens and Washington, marching 35 miles a day, burning bridges behind him, with General Shackelford and 500 men close upon his rear and skirmishing with it. Near Salineville on the 26th Shackelford's advance captured 250 men, and later in the day he was intercepted near New Lisbon and Beaver Creek, and surrendered with 364 officers and men. The Union loss in the campaign July 2-26 was 19 killed, 47 wounded and 8 missing.

E. A. CARMAN.

MORGANTE MAGGIORE, II, by Luigi Pulci (1432-1484), begun in 1460 and completed in 1483, is the first of the great Italian humorous poems dealing with the material of the Old French epic, with the adventures and adventures of the court of Charlemagne, with chivalry and deeds of valor, with Saracens, witches, and magic, with all that distinguishes men from cowards and loyalty from treachery in a world of strong arms and generous appetites, good humor and simple passions. It is a reworking of an earlier popular poem called the *Orlando*, with a few elements borrowed from another poem of the same cycle called the *Spagna*. Pulci thus obtained the traditional schematic plot of the Italian chivalric tale: the struggle between the house of Clermont and the treacherous descendants of Ganelon, resulting in the slander of Orlando, his flight to the Orient, his adventurous battles with the Saracens, his return to Paris to raise the inevitable siege by the Saracens, his reconciliation with Charlemagne, and his ultimate vengeance on his enemies at court. Pulci is more faithful to the spirit and the substance of the Carolinian tale than either of his great successors,

Matteo Maria Boiardo or Ludovico Ariosto, who utilized the more fantastic and sentimental legends of the Round Table to such an extent as wholly to transform the character of chivalric romance. The earnestness of the popular legend passed over directly into the *Morgante*, to constitute the solid base for its pervasive humorism on which the author then erects an original comic structure of his own, with not a few deliberately satiric elements. Neither Petrarchism nor classical models were strong enough in their influence on Pulci to alter or to vitiate this humorous attitude toward his subject. The reader will remember three salient figures from *Il Morgante Maggiore*: that of the giant Morgante himself, whose size and corresponding appetite for food have a jolly time getting along in this world made for smaller people; that of the half-giant Margutte, liar, thief, glutton, blasphemer, and all-around rascal of perennial good-nature, the most popular personage in the rambling story; and finally that of the devil Astoroth who treats learnedly on orthodox theology, and among whose many feats of magic the most famous and startling remains his discovery of a new Western world some years before the voyage of Columbus. Save in its best episodes, the *Morgante* is no longer much read. There is an English translation by William Roscoe

ARTHUR LIVINGSTON

MORGANTON, môr'gân-tûn, town, North Carolina, seat of Burke County, at an altitude of 1,181 feet, 15 miles south-southwest of Lenoir near the Catawba River, and served by the Southern Railway. The trade center for an agricultural and timber region, it manufactures leather goods, furniture, hosiery, textiles, and electrical equipment. A state school for the handicapped and a state hospital for the insane are located here.

Morganton was incorporated as a village in 1784 and as a town in 1885, and is governed by a mayor, council, and city manager. The water power, and light systems are municipally owned. Pop. (1950) 8,311.

MORGANTOWN, môr'gân-toun, city, West Virginia, seat of Monongalia County, situated on the navigable Monongahela River, at an altitude of 960 feet, 15 miles northeast of Fairmont and 103 miles south of Pittsburgh, Pa., and served by the Baltimore and Ohio and the Monongahela railroads, state and federal highways, and an air port with scheduled air service. It is located in the midst of an area rich in oil and gas fields, bituminous coal fields, limestone quarries, and deposits of glass sand. Its principal industries are the mining and shipping of the coal and the turning of the sand into industrial and commercial glass. Rolled, plate, and pressed glasses cut glass, wireglass, window glass, and watch crystals are made, while other industries manufacture coke, concrete blocks, and plumbing equipment. A United States ordnance works here produces chemicals from the coal and gas. The city is also the trading center for a district including a dozen small towns.

Morgantown has public and parochial schools, a city and a county hospital, over 20 churches, and is the seat of West Virginia University (q.v.). Nearby points of interest include Cooper's Rock State Forest, the largest in the state, Cheat River Canyon, Cheat Lake, and Dorsey's Knob

History.—Although there had been earlier settlers on the site, the town was named for the brothers Zackquill and David Morgan who, in 1760, made the first successful settlement here. Morgantown was incorporated in 1785, and is governed by an elected city council and an appointed city manager. The water supply system is municipally owned. Pop (1950) 25,525.

MORGARTEN, mör'gär-tën, mountain slope, Switzerland, with an altitude of 4,084 feet, five miles north of Schwyz, on the border of Schwyz and Zug cantons, just southeast of the lake of Aegeri. It is memorable as the scene of the battle of Nov. 15, 1315, in which a small body of Swiss mountaineers from Schwyz, Uri, and Unterwalden, ill-armed and undisciplined, totally vanquished an Austrian army of 20,000 under Duke Leopold I, sent by Frederick the Fair to avenge the seizure of the abbey of Einsiedeln the previous year. This was the first victory achieved by the Swiss in their struggle for freedom.

MORGAT, môr-gä', seaside resort, France, in Finistère Department, on Crozon Peninsula, 11 miles south of Brest. The chief occupation of the inhabitants is sardine fishing in Douarnenez.

MORGENSTERN, mör'gën-schtërn, Lina (nee Bauer), German writer and reformer: b. Breslau, Nov. 25, 1830; d. Berlin, Germany, Dec. 16, 1909. She did much social work in Berlin after her marriage (1854) to Dr. Theodor Morgenstern. She was leader of the woman's Verein (1860-1866) in their furthering the cause of the Froebel Kindergärten, and (1866) she founded the Verein Berliner Volksküchen (public kitchens). In 1868 she started the Kinderschützverein, for the protection of children; in 1869 she founded an institute for the training of young women in the useful arts. In 1880 she established a woman's society for the rescue of immoral girls, placing them in schools to teach them housework and farming.

She wrote *Das Paradies der Kindheit* (1861); *Der Häusliche Beruf* (1875); *Die Volksküchen* (1882); *Der Beruf des Weibes* (1869); *Die Frauen des 19 Jahrhunderts* (1888-1891); *Hilfsbuch zur Gründung, Leitung und Kontrolle von Volksküchen* (1892), besides several works on the systems of economical cooking.

MORGENTHAU, mör'gën-tou, Henry, American lawyer, merchant, and ambassador: b. Mannheim, Germany, April 26, 1856; d. New York, N. Y., Nov. 25, 1946. Coming to the United States in 1865, he attended the New York public schools, the College of the City of New York, and received his LL.B. degree from the Columbia Law School. He became a partner in the law firm of Lachman, Morgenthau and Goldsmith, New York (1879-1899), was president of the Central Realty Bond and Trust Company (1899-1905), and of the Henry Morgenthau Company (1905-1913), dealers in realty. He was ambassador to Turkey (1913-1916) and at the outbreak of World War I took charge of the interests in Turkey of Great Britain, France, Italy, Russia, Belgium, Switzerland, Montenegro, and Serbia, rendering invaluable assistance to these nations. He was vice chairman of the Near East Relief, and chairman of the com-

mission created by the League of Nations in 1923 for the settlement of the Greek refugees. In 1933 he was a delegate to the Geneva Wheat Conference—his last public service in official capacity.

He wrote *Ambassador Morgenthau's Story* (1918); and *All in a Lifetime* (1922); *My Trip Around the World* (1928); *I Was Sent to Athens* (1929).

MORGENTHAU, Henry, Jr., American public official: b. New York City, New York, May 11, 1891. He studied two years at Cornell University, and from 1922 to 1933 was publisher of the *American Agriculturist*. Under Gov. Franklin D. Roosevelt, Mr. Morgenthau served as conservation commissioner of the State of New York, also as chairman of the governor's agricultural advisory committee and member of the Taconic State Park Commission. A close friend and neighbor of the governor, the latter, after election to the presidency, appointed Mr. Morgenthau first, chairman of the Federal Farm Board, then governor of the Farm Credit Administration, and on Nov. 17, 1933, made him acting and under secretary of the treasury. He was appointed secretary of the treasury Jan. 1, 1934. Soon after the president's death, Mr. Morgenthau resigned his post (July 5, 1945) to become effective after President Truman's return from the "Big Three" conference at Berlin, being the sixth Roosevelt Cabinet appointee to resign after Mr. Truman took office. During his 11 years as head of the Treasury Department Mr. Morgenthau raised for government operations, for furtherance of the New Deal program and for war purposes, through taxation and loans \$450,000,000,000, far more than all his 50 predecessors from 1789 to 1934.

MORGHEN, mör'gân, Raffaello, Italian engraver: b. Florence, Italy, June 19, 1758; d. there, April 8, 1833. He received his early instruction in his art from his father, Filippo, and his uncle, Giovanni Elia, and was afterward placed as a pupil under the celebrated Volpato, whom he assisted in engraving the pictures of Raphael in the Vatican. He settled in Florence about 1793 as professor of copper-plate engraving in the Academy of Art. In 1803 he was chosen an associate of the French Institute; and in 1812 was invited to Paris by Napoleon, who treated him with flattering kindness.

Among the most remarkable of the other numerous works of Morghen may be noted *The Transfiguration* from Raphael; a *Magdalen* from Murillo; a *Head of the Savior* from Da Vinci; the *Hours* from Poussin; the *Prize of Diana* from Domenichino; the *Monument of Clement XIII* from Canova.

MORGIANA, mör-gī-ä'nä, a female slave figuring in "Ali Baba and the Forty Thieves," a story in the *Arabian Nights* (q.v.).

MORGUE, môrg (Old French, to look at solemnly), a place or building in large cities where the bodies of unknown persons who have perished by accident, murder or suicide are exposed, that they may be recognized by their friends. If not claimed within a certain period they are either buried or given over to medical institutions for dissection purposes. The name arose from the building in Paris, dating from the 5th century, devoted to this purpose.

MORI, Arinori, mō'rē ā-rē-nō'rē, Japanese statesman: b. Satsuma, 1848; d. 11 Feb. 1889. He was educated in England; as chargé-d'affaires in Washington arranged the postal convention between Japan and the United States; served as plenipotentiary in Peking and in London; and was Minister of Education from 1885 to his death. He was an extremely cultured man, with progressive educational ideas. On the day of the proclamation of the Japanese Constitution he was assassinated by a Shinto fanatic for violating a shrine at Ise by lifting the curtain with his walking stick.

MORIAH, mō-rī'ā, Palestine, the hill on which the temple of Jerusalem was built (2 Chron. iii, 1), and by many authorities believed to be the mount on which Abraham was commanded to sacrifice his son Isaac (Gen. xxii, 2).

MORICE, Adrian Gabriel, Canadian clergyman, ethnologist and author: b. Saint Mars-sur-Colmont, Mayenne, France, 27 Aug. 1859. He was educated at Oisseau, Sion and Autun, France, joined the Oblate Order in 1877 and three years later was sent to British Columbia. In 1882 he was ordained to the priesthood, and for the following three years labored as missionary to the Chilcotin Indians at William's Lake. From 1882 to 1906 he was stationed at Stuart's Lake, B. C., was then transferred successively to Kamloops 1906, Saint Boniface 1908, Winnipeg 1909, Duck Lake, Sask., 1910, and Winnipeg 1911. Since 1911 he has been lecturer in anthropology at the University of Saskatchewan. During his missionary career he mastered a number of Indian languages and compiled dictionaries and grammars of Chilcotin, Sekanais and Nahanais. He invented the Déné Syllabary and printed books in that language. He made maps during his wanderings up and down British Columbia. For one of these the Geographical Society of Paris awarded him a silver medal and another map was published by the provincial government. He was a member of the American Anthropological Association, the Historical Society of Saint Boniface, the Ethnological Committee of the British Association for the Advancement of Science, corresponding member of the Canadian Institute, the Geographical Society of Quebec and of many others in Canada and abroad. He was the author of 'Au pays de l'ours noir' (1897); 'History of the Northern Interior of British Columbia' (1904 et seq.); 'Aux sources de l'histoire manitobaine' (1907); 'Dictionnaire historique des Canadiens et des Métis français de l'Ouest' (1908); 'History of the Catholic Church in Western Canada' (2 vols., 1910). He collaborated in 'Encyclopædia of Religion and Ethics' and in 'The Catholic Encyclopedia.' D. 1939.

MORICHI, a palm. See MURICHI.

MORIER, mō'rī-ēr, **James Justinian**, English diplomatist, traveler and novelist: b. Smyrna, about 1780; d. Brighton, March 1849. He was educated at Harrow, England, and entered (1807) the Persian diplomatic service and returned (1809) to England via Turkey, making a journey that became celebrated and a description of which he published under the title of 'A Journey through Persia, Armenia and Asia Minor to Constantinople in the

years 1808 and 1809' (1812). Returning (1810) to Teheran as secretary of legation he made his journey (1815) back to Europe through Asia Minor and published another book entitled 'A Second Journey through Persia' (1818). After a trip to Mexico he settled in England and devoted himself to a literary life. Among his works are the Oriental novels 'Hajji Baba of Ispahan' (1824; new ed., 1914), perhaps his best work, 'The Mirza' (1842); 'Zohrab the Hostage' (1832); 'Ayesha, the Maid of Kars' (1834).

MORIER, Sir Robert Burnett David, English diplomatist: b. Paris, 1826; d. Montreux, 16 Nov. 1893. He was graduated (1849) at Balliol College, Oxford, entered (1851) the diplomatic service and served as attaché at the embassies of Vienna and Berlin. In 1865 he was appointed secretary of the embassy at Athens, then at Frankfurt, becoming (1871) chargé-d'affaires at Stuttgart, and (1872) at Munich. In 1876 he was made English Minister at Lisbon, and at Madrid 1881-84, was appointed Ambassador at Saint Petersburg, 1884-93. In 1888 he was in a bitter conflict with Count Herbert Bismarck, who accused him of furnishing Marshal Bazaine with information as to the German advance over the Moselle at the outbreak of the Franco-Prussian War. Later it was proven that spies of the French government had obtained the information from other sources and that Bismarck's dislike was really caused through his knowledge of the diplomat's brilliant work. He was created K.C.B. (1882), privy councillor (1885), G.C.B. (1887), D.C.L. Oxford (1889).

MÖRIKE, mé'rī-kē, **Eduard**, German lyric poet and short-story writer: b. Ludwigsburg, Württemberg, 8 Sept. 1804; d. Stuttgart, 4 June 1875. His father was Kreis Medical Councillor Karl Friedrich Mörike, d. 1817; his mother Charlotte, née Bayer. He attended the Latin school at Ludwigsburg, the seminary at Urach (1818), where he made the acquaintance of Wilhelm Hartlaub and Wilhelm Waiblinger; and the divinity school at Tübingen where he came into contact with Ludwig Bauer, David Friedrich Strauss and F. T. Vischer. After completing his studies at these theological institutions, he spent the greater part of his life as a country pastor in various parts of Württemberg. His longest incumbency was at Cleversulzbach (1834-43), where he associated with Justinus Kerner, Hermann Kurz, Uhland and Karl Mayer. From 1851 to 1866 he taught literature at the Stuttgart Katharinensstift, receiving the title of professor in 1856. His first literary work was the short novel of artist life, 'Maler Nolten,' which passed through many revisions and was printed in its final form after his death (1877). His shorter stories are more finished artistically, especially 'Mozart auf der Reise nach Prag' (Stuttgart 1856). As a lyricist, no other Suabian poet attains his simple yet perfect form. His observations of life and of nature are realistic, and his depth of feeling sometimes approaches Goethe's. Some of his poems have even become favorites among the people, especially the ballad 'Schön Rotraut,' opening with the line: 'Wie heisst König Ringangs Töchterlein?'

JACOB WITTMER HARTMANN

MORILLO, mō-rē'yō, Pablo, Spanish general: b. Fuente de Malva, Spain, 1777; d. Madrid, Spain, 27 July 1838. He enlisted in the navy in 1797 and was engaged at Trafalgar in 1805; but when the French invaded Spain he left the navy to enter the army and rose to the rank of major-general in 1814. In 1815 he was sent to South America to subdue the revolution in Venezuela and Colombia, and after varying fortunes, during which he made for himself a name as a cruel and tyrannous general, perceiving defeat to be inevitable, he asked to be relieved but was compelled to sign a truce with the victorious Bolívar before sailing for Spain. He was appointed to command the garrison at Madrid, and in 1822 became captain-general of Galicia, which he surrendered to the French. He retired in disgrace to Rochefort, France, but returned to Spain in 1832 and led an army against the Carlists. During his exile in France he published his *Mémoires* (1826).

MORIN, mō-rān, Arthur Jules, French mathematician and engineer: b. Paris, 19 Oct. 1795; d. there, 7 Dec. 1880. He was educated at the Ecole Polytechnique in Paris and at the Ecole d'Application at Metz, and was for a time professor of mechanics in the latter institution. In 1819 he became lieutenant in a battalion of engineers and later accepted a professorship at the Conservatoire des Arts et Métiers in Paris of which he became director in 1847. He held the rank of general in the army and was a member of various military boards, and his researches and inventions were of great scientific value. He published *Aide-mémoire de mécanique pratique* (1838); *Salubrité des habitations* (1868), etc.

MORIOKA, mō-rē-ō'kā, Japan, a town in the island of Hondo, 40 miles from the coast, and 339 miles by rail from Tokio. It is the capital of the prefecture of Iwate, in the northern province of Rikuchu, has manufactures of silk, copper and other ware, and is celebrated for its fine fruits and vegetables (many of these of American origin) and preserves. Mount Iwate (6,800 feet) is in the vicinity. Pop. 50,030.

MORISCOS, mō-rē'skōs, Spanish term applied to those Moors who accepted Christianity. After the fall of Granada (1492) many of the Moors returned to Africa. But most remained in Spain, permitted under pretense of conversion to Christianity and lived, under the name of Moriscos, as industrious, peaceful inhabitants, till they were driven to revolt by the cruel persecutions under Philip II (1568-70) and over 100,000 of them were exiled; the few remaining being now found in the mountains of Granada after Philip III (1609) deported another 500,000. Consult Rochau, *Die Moriscos in Spanien* (Leipzig 1853); Boronaty y Barraquina, *Los moriscos españoles y su expulsión* (Valencia 1901); Lea, *The Moriscos of Spain* (Philadelphia 1901).

MORISON, Samuel Elliot, American historian: b. Boston, Mass., 9 July, 1887. He was educated at Harvard and at Oxford, and studied in Paris. He became instructor in history in the University of California, 1914, and then served as instructor, lecturer, and is now professor of history at Harvard University. From 1922-25

he was Harold Vyvyan Harmsworth professor of American History at Oxford University, England. He was an American delegate to the Peace Conference (1919), and earlier was on the Am. Commission to Negotiate Peace. His publications include *Sources and Documents of the Am. Revolution* (1923); *Oxford History of the United States* (1927), etc.

MORISON, James Augustus Cotter, English biographer and essayist: b. London, 1832; d. 26 Feb. 1888. He was graduated at Oxford in 1859, was a Positivist in philosophy, was one of the most brilliant contributors to the *Saturday Review* and one of the founders of the *Fortnightly Review*. He wrote *Life and Times of Saint Bernard* (3d ed., 1877); brief biographies of Gibbon, Macaulay and Madame de Maintenon; *The Service of Man: An Essay toward the Religion of the Future* (2d ed., 1887), which he regarded as his best work. His knowledge of French literature and history was profound.

MORISON, Robert, Scottish botanist: b. Aberdeen, Scotland, 1620; d. London, 10 Nov. 1683. He was graduated from the University of Aberdeen in 1638 but having borne arms as a Royalist in the Civil War, was obliged to take refuge in France when the cause of Parliament triumphed, and took the degree of doctor at Angers in 1648. From 1650 to 1660 he was superintendent of the garden formed at Blois by Gaston, Duke of Orleans. After the Restoration he was appointed by Charles II one of his physicians and botanist royal, and in 1669 became professor of botany at Oxford. His strong point as a botanist was in classification. His chief work is *Oxford University History of Plants* (1680). Consult Pulteney, *Sketches of the Progress of Botany* (1790); Sachs, *History of Botany* (1906); Tournefort, *Eléments de Botanique* (1797).

MORISONIANS. See EVANGELICAL UNION.

MORISOT, mō'rē-sō, Berthe (MADAME EUGÈNE MANET), French painter: b. 1840; d. 1895. As great-granddaughter of Fragonard she inherited from this great French painter his gracefulness, his spirited elegance and other fascinating qualities. Her natural talents she placed under the influence of Corot, Renoir, Degas and Manet. Having married Eugène Manet, brother of the great painter, she exhibited with the "Impressionists," but always signed her pictures Berthe Morisot, delicately respecting Manet's great name. She acquired her own reputation by distinguished and beautiful coloring and dash. She was as much admired for her beauty as for her talent. A French critic sums up her qualities as follows: "All her work is bathed in brightness, in azure, in sunlight; it is a woman's work, but it has a strength, a freedom of touch and an originality, which one would hardly have expected. Her water-colors, particularly, belong to a superior art: some notes of color suffice to indicate sky, sea or a forest background and everything shows a sure and masterly fancy, for which our time can furnish no analogy. A series of Berthe Morisot's pictures looks like a veritable bouquet, whose brilliancy is less due to the color-schemes which are comparatively soft (gray and blue) than to the absolute correctness of the values. A hundred canvases

and perhaps 300 water-colors attest this talent of high mark. Normandy coasts, scenes with pearly skies and turquoise horizons, radiant gardens of Nice, fruit-laden orchards, girls in white dresses, with big hats wreathed in flowers, young women in ball-dresses and flowers are the favorite themes of this artist."

MORITZ, mō'rits, **Karl Philipp**, German author: b. Hameln, 15 Sept. 1756; d. Berlin, 26 July 1793. He was born of poor parents and became one of the most extraordinary figures in the Sturm und Drang (Storm and Stress) period. After distressful attempts to gain a living he caught the attention of a patron in Hanover and entered the gymnasium to reach quick promotion, but soon accepted an engagement as actor under Ekhof at Gotha, failing in which he returned to study (1776) at Erfurt; but tiring again he joined the Herrnhuter (Moravians) at Barby, and studied theology at Wittenberg (1777); then taught philanthropy at the Potsdam military orphanage, soon again to take to wandering. Teaching in Berlin, he made a reputation as writer, preacher and poet, and went to England; then became professor at the Kölnisches Gymnasium; next tried editing the *Vossische Zeitung* to make it proletarian, but failed. Later, he traveled to Italy (1786) where he met Goethe, who made a favorable influence on his mind, and on his return to Germany he took up residence as Goethe's guest at Weimar. Duke Karl August aided him to a membership in the Berlin Academy of Sciences and he became (1789) professor of antiquities at the Berlin Academy of Art. He wrote much of his life's vicissitudes into his works, notably, 'Anton Reiser' (Berlin 1785-90), an autobiographical novel; 'Andreas Hartkopf' (ib. 1786), also contains other elements from his life. Other important works are 'Versuch einer deutschen Prosodie' (Berlin 1786; later ed., 1815); 'Ueber die bildende Nachahmung des Schönen' (Brunswick 1788; Heilbronn 1888); 'Götterlehre' (Berlin 1791 10th ed., 1851); 'Reisen eines Deutschen in England' (ib. 1783); 'Reisen eines Deutschen in Italien' (ib. 1792-93). Consult Dessoir, 'Karl Philipp Moritz als Aesthetiker' (Berlin 1889); Eibisch, Hugo, 'Anton Reisers kritische Autobiographie' (Leipzig 1909).

MORLAIX, môr-lâ, France, capital of an arrondissement in the department of Finistère, picturesquely situated on two hills on the river Dossen, rendered navigable to the town. It is on the government railroad, L'Ouest, and has two churches dating from the 15th and the 16th centuries, besides ancient wooden houses, a commercial court of justice, chambers of commerce and of agriculture, a college, theatre, museum, hydrographic school, etc. Its industries consist of a tobacco factory, hardware, leather and candle factories, besides import trade in coffee, lumber, stearic acid, fertilizers, wine, brandy, petroleum. It has also an export trade in butter, grain, cattle, eggs, vegetables, fish, etc. Its population is about 12,000. It is the birthplace of the generals Moreau and Souvestres.

MORLAND, môr'land, **George**, English painter: b. London, 26 June 1763; d. there, 29 Oct. 1804. His father, himself a painter, gave

the boy a severe early training in art, and his proficiency was such that his productions found ready purchasers, while at 10 he exhibited in the Royal Academy and became famous as a copyist of Dutch interiors. Soon after he rebelled against the strict discipline of his father's house, and entered upon a career of dissipation, in the company of stable-boys, money lenders, pimps and pugilists, supporting himself, meanwhile, by the pictures which he painted with amazing facility. So great was his productivity, that he was able to paint one or two pictures daily, and on one occasion completed a large landscape containing six figures, in six hours. The demand for his work was so great that dealers would take them before the oil had dried. In 1786 he took up his residence at Kensal Green, where he changed his mode of life and married the sister of James Ward the animal painter, and William Ward, the engraver. Here he worked hard, and the moral subjects, after the manner of Hogarth, which he favored at this period, were engraved and became very popular. Soon again, however, he drifted back into his old habits, and, as his pictures were eagerly sought by the dealers, he was able for some time to carry on his reckless career. He had to make many changes of residence to avoid his creditors; and at length, in 1799, he was arrested for debt, but "obtained the rules of the Bench," took a house within the bounds and continued to practise his art up to his release in 1802. In his late days he suffered from a palsied hand. Under arrest for debt, he died in a sponging-house. His epitaph for himself was, "Here lies a drunken dog." The art of Morland is characterized by a picturesque representation of rural life in its homelier aspects, his rustic story being always happily conceived and skillfully told. He is one of the first genre and animal painters of the English school, and his reputation has increased of recent years. He painted about 4,000 pictures, 192 of which were engraved during his lifetime. Six of his best paintings are in the Kensington Museum and the 'Farmhouse Stable' in the National Gallery is sometimes considered his master piece. The New York Historical Society possesses his 'Old English Sportsman' and 'Dog Fighting'; the Metropolitan Museum the 'Midday Meal' and 'Weary Wayfarers' and the Corcoran Gallery, Washington, 'The Farmhouse.' Consult Collins, W., 'Memoirs of a Picture' (1803); and memoirs or biographies by Dawe (1807); Gilbert and Cuming (1907); Richardson, Ralph (1895); Williamson, G. (1904) and Wilson, D. H. (1907).

MORLAND, Sir **Samuel**, English inventor and diplomat: b. Sulhamstead-Bannister, Berk. 1625; d. Hammersmith, 30 Dec. 1695. He studied at Winchester School and at Magdalen College, Cambridge; was a tutor at Cambridge in Pepys' day; and about 1650 devoted himself to diplomacy. Cromwell sent him to Sweden in 1653; and in 1655 to the Duke of Savoy, to protest against the persecution of the Waldensians in whose history he became deeply but not too intelligently interested, his 'History of the Evangelical Churches of the Valley of Piedmont' (1658), relying as it did to some extent on documents that were forgeries, being absolutely misinformed and unreliable. He

alienated from the Commonwealth when he learned of Sir Richard Willis' plot against Charles II, and thereafter favored the Restoration. The king rewarded his support with a baronetcy. Subsequently, he withdrew from public life, devoted his time to mechanical experiments, and became one of the first to demonstrate the utility of steam power for propulsive purposes.

MORLEY, Christopher Darlington, American author: b. Haverford, Pa., May 5, 1890. He was graduated from Haverford College in 1910, was appointed a Rhodes scholar, and studied at New College, Oxford University, from 1910 to 1913. He then joined the editorial staff of Doubleday, Page & Company. From 1917 to 1920 he was successively with the *Ladies' Home Journal* and the *Philadelphia Public Ledger*, and from 1920 to 1924 he served on the staff of the *New York Evening Post*. He was a contributing editor of the *Saturday Review of Literature* from 1924 to 1940, and subsequently served as one of the judges of the Book-of-the-Month Club. In 1937, he edited, with Louella D. Everett, the revised edition of Bartlett's *Familiar Quotations*. His published works include essays, fiction, plays, and poetry. Among them are *Parasols on Wheels* (1917); *Shandygaff* (1918); *The Haunted Book Shop* (1919); *Three's a Crowd*, with Earl Derr Biggers (1920); *Tales from a Rolltop Desk* (1921); *Where the Blue Benches* (1922); *The Powder of Sympathy* (1923); *Pandora Lifts the Lid*, with Don Marquis (1924); *One Act Plays* (1924); *Thunder on the Left* (1925); *The Romany Stain* (1926); *Off the Deep End* (1928); *Seacoast of Bohemia* (1929); *John Mistletoe* (1931); *Human Being* (1932); *Mandarin in Manhattan* (1933); *The Trojan Horse* (1937); *Kitty Foyle* (1939); *Thoroughfare* (1942); *The Middle Kingdom* (1944); *Spirit Level* (1946); *The Old Mandarin* (1947).

MORLEY, Felix Muskett, American author and educator: b. Haverford, Pa., Jan. 6, 1894. He was graduated from Haverford College in 1915, was appointed a Rhodes scholar, and from 1919 to 1921 studied at New College, Oxford University. In 1921-1922, he was a research fellow at the London School of Economics, and in 1928-1929 a Guggenheim fellow in political science. He received a Ph.D. degree from the Brookings Institution in 1936. From 1922 to 1929 he was a member of the staff of the *Baltimore Sun*, serving as correspondent in the Far East (1925-1926) and at Geneva (1928-1929). He was director of the Geneva office of the League of Nations Association from 1929-1931, and became a member of the staff of the Brookings Institution in 1931. From 1933 to 1940 he was editor of the *Washington Post*, and from 1940 to 1945 president of Haverford College. In addition to numerous articles, he wrote *Unemployment Relief in Great Britain* (1924); *Our Far Eastern Assignment* (1926); and *The Society of Nations* (1932). In 1936, he received the Pulitzer Prize for editorial writing.

MORLEY, Frank, American mathematician: b. Woodbridge, Suffolk, England, Sept. 9, 1860; d. Baltimore, Md., Oct. 17, 1937. He studied at King's College, Cambridge University, receiving the degrees of A.B. (1883), A.M. (1886), and ScD. (1898). From 1884 to 1887 he was a master of Bath College, England. He then went to the United States, becoming (1887-

1888) instructor, then (1888-1900) professor, of pure mathematics at Haverford College. From 1900 to 1928 he was professor of mathematics at Johns Hopkins University. From 1900 to 1930 he was editor of the *American Journal of Mathematics*. His works include *Elementary Treatise on the Theory of Functions*, with James Harkness (1893); *Introduction to the Theory of Analytic Functions* (1898); *Inversive Geometry*, with his son, Frank V. Morley (1933). He was also the father of Christopher Morley and Felix Morley (qq.v.).

MORLEY, Henry, English author: b. Hatton Garden, London, Sept. 15, 1822; d. Carisbrooke, Isle of Wight, May 14, 1894. Educated at King's College, London, he practiced medicine in Somerset and Shropshire; taught at Manchester and Liverpool; and was connected editorially with Charles Dickens' periodicals, *Household Words*, and *All the Year Round*. From 1859 to 1865, he served as editor of the *Examiner*, and from 1865 to 1889 as professor of English literature, University College, London. In 1878, he occupied a similar post at Queen's College, London, and from 1882 to 1890 was principal of University Hall. He edited Morley's Universal Library (1883-88), Cassell's National Library (1886-90), and the Carisbrooke Library (1889-91). Among his works are several biographies—*Palissy the Potter* (1852), *Jerome Cardan* (1854), *Cornelius Agrippa* (1856), and *Clément Marot* (1870); and a history of English literature, *English Writers*, 10 vols. (1864-94). Morley devoted his life to the popularizing of good literature and often lectured on literary subjects.

MORLEY, John, Viscount MORLEY OF BLACKBURN, English author and statesman: b. Blackburn, Lancashire, England, Dec. 24, 1838; d. London, Sept. 23, 1923. The son of a surgeon, he was educated at University College School, London, Cheltenham College, and Lincoln College, Oxford University, receiving the degree of A.B. in 1859. While at Oxford, he was influenced by the positivist teachings of Auguste Comte and the economic theories of John Stuart Mill. After 1860 he was a journalist in London, in 1863 joining the staff of the *Saturday Review*. From 1867 to 1882 he served as editor of the *Fortnightly Review*. During his editorship this magazine became known for its high literary standards and liberal views and attracted many eminent contributors. Beginning in 1878, he edited the *English Men of Letters* series, and from 1880 to 1883 was editor of the *Pall Mall Gazette*. It was at this time that he first became associated with the cause of Irish home rule, opposing the policy of coercion in Ireland which then found favor with leaders of the Liberal Party. He was elected to Parliament from Newcastle as a Liberal in 1883. After the conversion of his party to home rule, he accepted the post of chief secretary for Ireland in the short-lived Gladstone Cabinet of 1886. This appointment was acceptable to Irish nationalists because, unlike Gladstone and the majority of his colleagues, he had no previous record of political action on the subject of Ireland. He became the trusted intermediary in the difficult and delicate negotiations between the Irish members of Parliament and the Cabinet leading to the introduction of the first two home rule bills. After the defeat

of the measure of 1886, he made many speeches in England and Ireland in favor of home rule. From 1892 to 1895 he was again secretary of state for Ireland. Defeated at Newcastle in the general election of 1895—largely because he had refused to vote for an eight-hour law—he was elected in the following year for the Montrose Burghs, a seat he held until his elevation to the peerage in 1908. As secretary of state for India (1905–1910), he worked with the viceroy, the 4th earl of Minto, to achieve notable legislative reforms. He then became lord president of the council but, because of his well-known pacifist views, resigned this office at the outbreak of World War I in 1914.

Morley was considered the epitome of late Victorian liberalism. He had a distinguished career in public affairs, but it was as a writer and editor that he made his most notable contribution. The most eminent biographer of his time, he published *Voltaire* (1872); *Rousseau* (1873); *Diderot and the Encyclopaedists* (1878); *Burke* (1879); *Life of Richard Cobden* (1881); *Walpole* (1889); and the monumental *Life of Gladstone* (3 vols., 1903). Among his other works are several editions of *Critical Miscellanies*; *On Compromise* (1874); *Studies in Literature* (1891); and *Recollections* (2 vols., 1917).

Consult Hirst, Francis F., *Early Life and Letters of John Morley*, 2 vols. (New York 1927); Staebler, Warren I., *The Liberal Mind of John Morley* (Princeton 1943).

MORLEY, Sylvanus Griswold, American archaeologist: b. Chester, Pa., June 7, 1883; d. Santa Fe, N. Mex., Sept. 2, 1948. He was educated at Harvard (B.A., 1907; M.A., 1908), and from 1909 to 1914 did field work in Mexico and Central America for the School of American Archaeology. From 1915 to 1940 he was associated with the Carnegie Institution of Washington, directing its project at Chichén Itzá (q.v.) from 1924. Morley became a leading authority on the ancient Maya. His published works include *An Introduction to the Study of Maya Hieroglyphs* (1915); *The Inscriptions at Copán* (1920); *Guide Book to the Ruins of Quirigua* (1935); *The Inscriptions of Petén* (5 vols., 1938); and *The Ancient Maya* (1946).

MORLEY, Thomas, English composer: b. 1557; d. London, England, ?1603. He was a pupil of William Byrd. After receiving the degree of bachelor of music at Oxford in 1588, he probably became organist of St. Giles, Cripplegate. About 1591 he became organist of St. Paul's, and in the following year was appointed gentleman of the Chapel Royal (because of ill health he resigned this position in 1602). In 1598 he was given an exclusive, 21-year license to print music books and sell ruled music paper. Between 1593 and 1600 he published six books of canzonets, madrigals, and ballets; *The First Booke of Aires* (1600) contains the page's song which he composed for *As You Like It*. He also edited collections of works by others, including *The Triumphs of Oriana* (1601) in honor of Elizabeth I, and he wrote *A Plaine and Easie Introduction to Practicall Musick* (1597).

MORLEY, municipal borough, England, situated in the West Riding of Yorkshire, 4 miles southwest of Leeds. It has establishments producing woollens and worsteds, textile machinery, glass, pharmaceuticals, and leather, and there are coal mines and stone quarries nearby. Morley was the

site of a Royalist siege during the Civil War. Pop. (1951) 39,783.

MORMON CRICKET, the common name of a large, black, wingless grasshopper (*Anabrus simplex*) of the Rocky Mountain states. Its periodic migrations have caused great crop destruction, and the United States Department of Agriculture pursues an active program of control.

MORMONS. The term "Mormons," which is derived from the *Book of Mormon*, is a nickname applied to members of the Church of Jesus Christ of Latter-day Saints, whose headquarters are in Salt Lake City, Utah.

HISTORY

Joseph Smith (q.v.), the founder of the church, was born on Dec. 23, 1805, in Sharon, Vt. In 1816 he accompanied his family to upstate New York. The Smiths were honest, God-fearing people who loved their country, read the Bible, and prayed, but belonged to no church. Joseph relates that, when he was between 14 and 15 years of age, a religious revival in which the ministers of all the various denominations joined was held in his neighborhood. His mother and three of his brothers and sisters joined the Presbyterian Church. Joseph had a strong desire to join a church himself, but did not know which one to choose. While pondering this question, he read (James 1:5): "If any of you lack wisdom, let him ask of God, that giveth to all men liberally, and upbraideth not, and it shall be given him." Acting on this admonition, he retired to a grove near his home in the vicinity of Palmyra. Here, he relates that, in answer to his prayer, he received a glorious vision in which the Father and the Son appeared to him. "I saw two personages whose brightness and glory defied all description standing above me in the air. One of them spake to me, calling me by name, and said, pointing to the other, 'This is My Beloved Son. Hear Him.'" The Son thereupon declared to the young man the great mission which he was to be called to perform.

Smith further relates that on the night of Sept. 21, 1823, while he prayed for divine guidance, there appeared in his room a glorious light in the midst of which stood a person clothed in white with a countenance of radiant purity. The visitor announced himself as Moroni, a messenger sent from the presence of God, and said that there was a book deposited in a hill written on plates of gold giving an account of the former inhabitants of the North American continent and the source from which they sprang. The following day, Smith tells us, he went to the hill which he had seen in the vision and with some labor laid bare the stone box containing the plates and other things spoken of by the messenger. The angel again stood beside him and forbade him to move the contents of the box, explaining that four years were to elapse before the plates could be committed to his care, and that it would be his duty to visit the spot at yearly intervals. The bringing forth of the plates from their resting place of centuries and their translation were eventually completed, and the book was published in Palmyra, N. Y., in 1830. This first edition of the *Book of Mormon* consisted of 5,000 copies. Since then many editions have been published, millions of copies have been distributed, and the work has been translated into many different languages.

The Organization of the Church.—Lying at

center of Mormonism is the question of divine authority. Joseph Smith affirms that his authority was conferred on him by direct administration of heavenly beings, each of whom had once exercised the same power on earth. He relates that on May 4, 1829, the Aaronic or lesser priesthood was conferred on him and on Oliver Cowdery by John the Baptist. In delivering his message, John stated that he was acting under the direction of the Apostles Peter, James, and John, in whose hands reposed the keys of the Melchizedek or higher priesthood, which in time would be given. His promise, affirmed Smith, was fulfilled later that year when the three apostles visited him and Cowdery, ordaining them to the apostleship, which comprises all the offices of the higher order of priesthood and carries authority to administer in all of the established ordinances of the Gospel.

The organization of the church as a body corporate was effected on April 6, 1830, in Fayette, N. Y., with six members, the minimum required by state law. The first gathering place of the church was in Kirtland, Ohio. Here the first stake of Zion was organized, the first temple was built, the School of the Prophets was established, and the church was more completely organized.

The Church in Missouri.—In the summer of 1831 the first group of Mormons arrived in western Missouri, settling in Jackson County on lands secured from the federal government and dedicated as a site for the center stake of Zion. Things did not work out as anticipated. The Mormons differed socially and religiously from the old settlers. Most of them were from the Northern and Western states and were in sympathy with the abolitionists, while Missouri was linked with the South and was a proslavery state. Intolerance, jealousy, and hatred were soon manifest toward the gathering Mormons. As a consequence, 15,000 members of the church were forced to flee from their Missouri homes. Through the winter of 1838-1839 they painfully made their way eastward toward Illinois, and many died from exposure or illness. A number of the leaders of the church were imprisoned, and Brigham Young (q.v.) directed this sorrowful migration.

Nauvoo.—The people of Quincy, Ill., received the refugees with kindness, provided for their necessities, and sought employment for their men. In the spring of 1839 land was purchased at Commerce, 45 miles north of Quincy, and a settlement was established there. Commerce was then a mosquito-infested bog. The Mormons drained the swamps, planned a city with streets intersecting at right angles, and built homes. With very little else than their bare hands they transformed the bog into a beautiful city called Nauvoo, which in six years had a population of about 20,000. Here they erected a temple regarded as one of the finest structures west of the Allegheny Mountains.

The time came when the Mormons, who usually voted as a unit, held the balance of power in Illinois elections. This aroused the animosity of their opponents to a murderous degree and was a contributing factor in the martyrdom of Joseph Smith and his brother Hyrum at the hands of a mob of 200 men in Carthage, Ill., on June 27, 1844. Brigham Young, president of the Quorum (Council) of the Twelve Apostles, succeeded Smith as leader of the church. Persecution reached a point where it became evident that the Mormons must leave Illinois. On Feb. 4, 1846, the first of them left Nauvoo and crossed the Mississippi.

The Migration to Utah.—During the year 1846 thousands of Mormons made their way across Iowa and reached Council Bluffs, on the east side of the Missouri River. Crossing to the west bank, they established what is known in Mormon history as Winter Quarters (the site is in modern Omaha, Nebr.). From here, in April 1847, the first company of pioneers began their historic trek across the Great Plains, arriving in Salt Lake Valley on July 21-24, 1847. From then until the completion of the railroad in 1869, more than 80,000 Mormons crossed the plains with ox teams and handcarts. Of those who started, 6,000 were unable to finish and were buried in nameless graves by the roadside.

In 1849 the State of Deseret was formed, with Young as governor (see *DESERET, STATE OF*). Two years later, when Utah was given a territorial government, he was appointed its first governor.

Mormon Expedition.—False and inflammatory charges were made by corrupt officials, appointees of the federal government, against Governor Young and the Mormon people. These charges were accepted at face value by President James Buchanan, who determined in 1857 to change the governor and the judges and directed that an army commanded by Col. Albert S. Johnston accompany the new appointees to sustain them and to suppress a falsely reported rebellion among the Mormon people, which in fact did not exist. (Johnston's force is known in history as the Mormon Expedition.) The people of Utah resented the coming of this army and prepared to burn their homes, lay waste their fields, and move. Many did move temporarily to the southern settlements. Alfred Cumming, the newly appointed governor, came to Salt Lake City without guards and was received with honor in 1858. After his arrival, and on his recommendation, a commission was appointed to investigate matters, and the critical situation was cleared up.

Polygamy.—The controversy over polygamy was a very bitter one. This doctrine, which was announced by Joseph Smith in Nauvoo in 1843, was not publicly taught until 1852. The practice was limited—not more than 3 per cent of the marriages among the Mormon people were polygamous. Moreover, it was kept on a high spiritual level, and only those deemed worthy of the ceremony and ordinance were permitted to enter into it. It was the kind of thing, however, which the enemies of the church could easily capitalize on to make trouble.

In 1862, Congress passed an antipolygamy law. This law was considered unconstitutional by many people in the nation and generally by the Mormons as infringing on their religious liberty, and few persons were prosecuted under it. The Edmunds Act of 1882 made polygamy punishable by fine or imprisonment. No man who had more than one wife could act as a juror in a Utah court, and in Idaho members of the church were disfranchised. The Edmunds-Tucker Act of 1887 gave added power to judges to try polygamy cases. This act also disincorporated the church, ordered the executive to take appropriate action to wind up its affairs, and required that its property be escheated to the nation. The law was administered with harshness. Numerous Mormons were disfranchised, many men were imprisoned because they had plural families, and homes were broken. The election machinery was taken from the hands of the people. As a result of a Supreme Court decision sustaining the law, Mormon Presi-

dent Wilford Woodruff, on Oct. 6, 1890, issued what is known in church history as the Manifesto. It declared an end to the practice of plural marriage, and since that time the church has not practiced or sanctioned such marriages.

Statehood and Subsequent Developments.—

On Jan. 4, 1896, Utah, under a proclamation issued by President Grover Cleveland, entered the Union as a state, and on March 28 of that year what was left of the escheated property was returned to the church by act of Congress.

Brigham Young, who had presided over the church for 30 years, was succeeded in 1877 as president by John Taylor (he was acting president until 1880). It was during Taylor's presidency that the crusade against polygamy was at its height. After Taylor's death the following served as president: Wilford Woodruff (1889–1898), Lorenzo Snow (1898–1901), Joseph Fielding Smith (1901–1918), Heber J. Grant (1918–1945), George Albert Smith (1945–1951), and, since 1951, David O. McKay.

ORGANIZATION, BELIEFS, AND WORK

Mormons believe that two major responsibilities rest on the church: (1) to proclaim the truth to all the world, and (2) to perfect the lives of those who accept it. The organization is suited to the promotion of these objectives.

Government and Organization.—The government and organization of the Mormon Church center in the priesthood, which Mormons define as the power of God delegated to man by which he is authorized to act in the name of and by the authority of God. The Aaronic priesthood has to do mainly with the temporal affairs of the church: the collection of offerings, distribution of charities, and care of properties belonging to the church; the administration of the outward ordinances of the Gospel, such as baptism, administration of the sacrament; and the supervision of ward teaching. The offices in this lesser priesthood are priest, teacher, and deacon. There is a general presidency of the Aaronic priesthood, called the Presiding Bishopric, which consists of three high priests, one of whom is bishop and the two others counselors. These high priests are designated and ordained by the First Presidency, and sustained by the vote of the people of the church.

The Melchizedek priesthood has to do with spiritual affairs: the proclamation of the truth to the world, bearing witness to it, and directing the general activities of the church, including the supervision of temporal affairs. From members of this priesthood are drawn the administrative officers of the church. The offices are apostles, high priests, seventies, and elders. There is in addition the office of patriarch, which corresponds to evangelist.

At the head of the entire church is the presiding high priest with his two counselors, who are known as the First Presidency. The whole government of the church, temporal and spiritual, is lodged in these three men.

In the Mormon Church there is no clergy class. All men who desire to hold the priesthood and are worthy to do so may receive it. It can be conferred only by one who holds it and who is authorized to confer it. Services in the church are widely distributed and gratuitous.

Geographically, the church is divided into stakes, wards, branches, and missions. A ward is a local unit, corresponding roughly to a parish, that is presided over by a bishop and two counsel-

ors, who are assisted by a large corps of officers. Each individual has a definite responsibility. Directly under the bishopric are persons called to work as ward teachers who visit each home at least once a month. Stakes, which are composed of an average of eight wards, are presided over by a stake president with two counselors. These men are assisted by a council of 12, who constitute the high council of the stake. A branch is a smaller division than a ward and is presided over by a branch president.

All of the territory lying outside the boundaries of the stakes is divided into missions presided over by mission presidents. It is each mission president's responsibility to look after the welfare of all the branches and members of the church within his mission and to direct all missionary labors in his field.

In addition to the regular church organization there are five auxiliary organizations: the Sunday schools, the Relief Society for women, the Young Men's Mutual Improvement Association, the Young Women's Mutual Improvement Association, and the Primary Association for children.

As of April 1955, there were 1,993 wards, 219 stakes, and 42 missions. The total membership of the church was approximately 1,302,240 with 180,000 men holding the Melchizedek priesthood and 136,000 boys and men belonging to the Aaronic priesthood.

Beliefs.—Four books are accepted by the church as containing the revealed words of God, and as being the written authoritative guides in faith and doctrine. They are the Bible, the *Book of Mormon*, the *Doctrine and Covenants*, and *The Pearl of Great Price*. One of the cardinal principles of the church is the doctrine of continuous revelation—that is, that God continues to reveal His mind and will to His children, supplementing the revelations of the past. The *Book of Mormon*, *Doctrine and Covenants*, and *The Pearl of Great Price* have been added to the Bible as scriptures pursuant to this principle. The people stand ready to accept further revelation when it shall come through the proper source.

The church has no formulated creed. Its cardinal doctrines are concisely stated in the *Articles of Faith*, which were written by Joseph Smith in 1842:

1. We believe in God, the Eternal Father, and in His Son, Jesus Christ, and in the Holy Ghost.
2. We believe that men will be punished for their own sins, and not for Adam's transgression.
3. We believe that through the Atonement of Christ, all mankind may be saved, by obedience to the laws and ordinances of the Gospel.
4. We believe that the first principles and ordinances of the Gospel are: first, Faith in the Lord Jesus Christ; second, Repentance; third, Baptism by immersion for the remission of sins; fourth, Laying on of hands for the gift of the Holy Ghost.
5. We believe that a man must be called of God, by prophecy, and by the laying on of hands, by those who are in authority to preach the Gospel and administer in the ordinances thereof.
6. We believe in the same organization that existed in the Primitive Church, viz., apostles, prophets, pastors, teachers, evangelists, etc.
7. We believe in the gift of tongues, prophecy, revelation, visions, healing, interpretation of tongues, etc.
8. We believe the Bible to be the word of God as far as it is translated correctly; we also believe the Book of Mormon to be the word of God.
9. We believe all that God has revealed, all that He does now reveal, and we believe that He will yet reveal many great and important things pertaining to the Kingdom of God.
10. We believe in the literal gathering of Israel and in the restoration of the Ten Tribes; that Zion will be built upon this (the American) continent; that Christ will reign personally upon the earth; and, that the earth will be renewed and receive its paradisiacal glory.

11. We claim the privilege of worshiping Almighty God according to the dictates of our own conscience, and allow all men the same privilege, let them worship how, where, or what they may.

12. We believe in being subject to kings, presidents, rulers, and magistrates, in obeying, honoring, and sustaining the law.

13. We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to all men; indeed, we say that we follow the admonition of Paul "We believe all things, we hope all things, we have endured many things, and hope to be able to endure all things. If there is anything virtuous, lovely, or of good report or praiseworthy, we seek after these things."—Joseph Smith.

These articles are not to be regarded as a complete exposition of faith, for, as stated in Article 9, "we believe that He will yet reveal many great and important things pertaining to the Kingdom of God."

Missionary Work.—Since its organization the church has carried on missionary work in most of the civilized countries of the world. Missionaries are volunteers who give their time, pay their own expenses, and serve for about two years. They travel in pairs and labor under the direction of their mission president.

Education.—"It is impossible for a man to be saved in ignorance" (*Doctrine and Covenants* 131:6) is a Mormon aphorism. Education with the Mormons is a matter of religious significance. This has resulted in the development of a carefully coordinated plan for the secular and religious training of church members. The church maintains 155 seminaries adjacent to high schools, where religious instruction is given to Latter-day Saint children attending these schools; and 15 institutes adjacent to universities, where religious instruction is given to Latter-day Saint students attending these institutions. It also maintains Ricks College in Rexburg, Idaho, and Brigham Young University in Provo, Utah.

Word of Wisdom.—In 1838, Joseph Smith received a revelation known as the Word of Wisdom. This is regarded by Mormons as a divine law of health and enjoins on members of the church total abstinence from the use of tea, coffee, tobacco, wine, and strong drinks, and counsels moderation in all things.

Temples.—Latter-day Saints believe in vicarious work for the dead. They believe that the Gospel is preached in the spirit world so that all people may have the opportunity of accepting it. They also believe that all ordinances necessary for the salvation of the dead who accept the Gospel must be performed here on earth. For this purpose temples are erected. Mormons believe that marriages solemnized in these temples, by one authorized to perform them, are for time and eternity.

To do this work for the dead it is necessary to have each individual's genealogical record. The church therefore organized its own genealogical society and established in Salt Lake City one of the best genealogical libraries in the United States.

Tithing.—Tithing is the revenue law of the church. One tenth of a member's annual income is given to the church through the bishop for general church purposes. The money is used for the building and maintenance of temples, meeting-houses, and other buildings; the support of education and the missionary system; and the care of the sick. Payment is voluntary, and those without income are exempt.

Church Welfare Program.—The church has a unique plan for caring for its poor, the Church Welfare Program, organized in 1936. Its aim is to help the people to help themselves. The pro-

gram has a twofold objective: (1) to put to work every employable person for whose temporal welfare the church assumes a responsibility, and (2) to obtain and administer for the needy life's necessities.

To obtain these necessities the bishops have two sources of income: (1) cash received from fast offerings, and (2) commodities received from welfare projects. Members of the church are asked to abstain from eating two meals on the first Sunday of the month and to give the equivalent of what they have saved from fasting to the support of the needy. This puts in the hands of the bishop a sizable sum with which to meet the cash requirements of the needy of his ward. Throughout the church stakes and wards are encouraged to develop projects through voluntary contributions of church members. These provide opportunities for welfare recipients to labor for what they receive. Such projects produce grain and grain products, meat, dairy, and poultry products, fruit and vegetables, fuel, furniture, bedding, and other commodities.

(Salt Lake City 1892-1904); Smith, Joseph F., *Essentials in Church History* (Salt Lake City 1922); Roberts, Brigham H., *A Comprehensive History of the Church of Jesus Christ of Latter-day Saints*, 6 vols. (Salt Lake City 1930); Anderson, Nels, *Desert Saints* (Chicago 1942); Hunter, Milton R., *Utah: The Story of Her People, 1540-1947* (Salt Lake City 1946).

EDITOR'S NOTE.—The Reorganized Church of Jesus Christ of Latter Day Saints, whose members do not call themselves Mormons, is treated in a separate article.

MORMYRIDAE, mô-mîr'î-dê (from Gr. *mormyros*, sea fish), a family of fishes from the Nile River and all fresh waters of tropical Africa except those of Kenya, Tanganyika, and Uganda. There are some 11 genera. The mouth is small, and the jaws are often set at the end of a tubular snout; the vertical fins are far back on a body whose greatest depth is back of the mid-line. The eyes are small and covered by a membrane. The skull structure is highly specialized, and the brain is larger in proportion to the body size than in any other fish.

Though easily recognized as members of the family, some species are fairly normal looking, but others—for example, some species of *Gnathonemus*—have elephantlike trunks from the tip of which hang fleshy filaments. Some species reach five feet in length, but most are much smaller. Their rather flat bodies weigh little for their length. They vary in color from brown, purplish, or greenish to silvery and sometimes have chalk-white bellies. Some species, perhaps all, are equipped with weak electric organs, apparently for nonvisual perception of their surroundings.

The mormyrids are mud grubbers, living in muddy streams and lakes and eating larval insects and worms. Anglers sometimes hook them. Some natives eat them, but Hugh Copley tried this and thought he was being poisoned.

MORNAY, môr-nâ', Philippe de, SEIGNEUR DU PLESSIS-MARLY (commonly known as DU-

PLESSIS-MORNAY), French Huguenot leader: b. Buhry, Normandy, France, Nov. 5, 1549; d. La Forêt-sur-Sèvre, Nov. 11, 1623. He was converted to Protestantism by his mother and, after studying at Heidelberg and Pavia, entered the service of Admiral Gaspard de Coligny. In 1572, at the time of the Massacre of St. Bartholomew, he escaped to England. Returning to France in 1573, he took up arms for the Huguenot cause. In 1576 he became an adviser of Henry of Navarre, who employed him on diplomatic missions and appointed him governor of Saumur. His influence grew steadily, and he became known as the Huguenot pope. In 1593, after Henry became a Roman Catholic, Mornay retired to Saumur, where he founded a Protestant university and devoted himself to writing. He remained at Saumur until 1620, when he was forced to resign his post. His principal published work is *De l'institution, usage et doctrine du saint sacrement de l'eucharistie en l'église ancienne* (1598). His *Mémoires* were published posthumously in 1624-1651, and in a 12-volume edition in 1824.

MORNING-GLORY, the name of a very popular twining herb, the common morning-glory (*Ipomoea purpurea*), naturalized from tropical America and widely cultivated in many named varieties, with flowers ranging from purple, red, and bluish to white and variegated forms. The name is also applied to the entire genus *Ipomoea* of the morning-glory family, Convolvulaceae (q.v.), found in all warm parts of the world. Broadly defined, *Ipomoea* includes about 400 species of (1) annual twiners like *I. hederacea*, whose seeds yield the medicinally useful resin pharbitisin, and *I. purpurea*; (2) perennial twiners like man-of-the-earth or wild potato vine (*I. pandurata*), with long, heavy tuberous roots and white flowers, found in the southern United States, and the Mexican true jalap (*I. purga* or *Exogonium purga*), with tuberous roots weighing 40 to 50 pounds (source of the drug jalap) and purplish rose flowers; and (3) evergreen twiners, often seen in greenhouses, like the West Indian *I. Horsfalliae*, with deep rose flowers, and the blue dawn flower (*I. Learii*), with bright blue flowers that turn magenta with age. See also JALAP.

THEODOR JUST.

MORNINGSIDE COLLEGE, a coeducational institution of higher learning in Sioux City, Iowa. It is affiliated with the Methodist Church. Chartered as the University of the Northwest in 1889, it was reincorporated under its present name in 1894. The curriculum is divided into divisions of fine arts, humanities, natural science, and social studies. In 1953 the grounds, buildings, and equipment were valued at \$1,690,338, and the endowment totaled \$922,093. In the 1954-1955 academic year there were 35 full-time faculty members and 1,243 students.

MORNY, môr-ně', Duc Charles Auguste Louis Joseph de, French politician: b. Paris, Oct. 23, 1811; d. there, March 10, 1865. The illegitimate son of Comte Auguste Charles Joseph de Falhaut de la Billarderie and Hortense de Beauharnais (qq.v.), wife of Louis Bonaparte, he was known as the comte de Morny until 1862, when he was created a duke by his half brother, Napoleon III. From 1830 to 1838 he served with

some distinction in the French Army, part of the time in Algeria, after which he combined commercial speculation with politics. Becoming a deputy in 1842, he played a major role in the coup d'état of Dec. 2, 1851, and as minister of the interior (1851-1852) and president of the Corps Législatif (1854-1865) exerted much influence in the Second Empire. His usually successful and probably unscrupulous commercial speculation included mining interests in Sonora, Mexico, and one of Maximilian's secretaries asserted that Morny was the chief buttress in France of the Mexican Empire. While serving (1856-1857) as envoy at the coronation of Alexander II of Russia, he married Princess Sophie Trubetzkoi.

MOROCCO, mô-rök'ô (Fr. MAROC; Sp. MARRUECOS; Arab. EL MAGHREB EL AQSA, literally "the Far West"), a territory of northwestern Africa, sometimes referred to as the Sherifian Empire (from "sherif," a descendant of med) and consisting of three zones: the French, the Spanish, and the international zone of Tangier. Morocco is located between latitudes 35° N. and 28° N. and longitudes 10° W. and 1° W., and is bounded on the north by the Mediterranean Sea, on the west by the Atlantic Ocean, on the east and southeast by Algeria, and on the southwest by Río de Oro (Spanish Sahara). The border with Algeria is only partially defined.

The total area of 165,651 square miles is divided among the protectorates of France (147,888 square miles) and Spain (10,039 square miles), and the international zone of Tangier (135 square miles). Ifni is a small Spanish enclave on the southwestern coast of French Morocco. Rabat and Tetuán are the administrative capitals of the French and Spanish protectorates, respectively; Fez (Fès) and Marrakech have been historically considered as northern and southern capitals, respectively, with residences of the sultan in each.

The Land.—Morocco may be divided roughly into three areas, according to marked differences in terrain: (1) the northern coastal massif, along the Mediterranean, comprising a chain of lesser mountains known as Er Rif, part of the Maritime Atlas, and varying in elevation up to about 8,000 feet; (2) the great mountain system of the Atlas, occupying most of the French zone and extending in three parallel ranges from the Atlantic coast in the southwest to Algeria and the Mediterranean in the northeast; and (3) the wide plateaus and lowlands lying between the mountain systems and extending westward from the foothills of the Atlas to the Atlantic. Both the mountain ranges and the Atlantic tend to moderate the tropical heat of Africa, and to provide a relatively equable temperature of between 40° and 90°F. in the northwesterly regions where the largest centers of population are located. Maximum annual rainfall of about 30 to 40 inches occurs in the northwest.

The Grand Atlas (or High Atlas) Mountains, with an average elevation of 11,000 feet, extend from the southwestern coast between Mogador and Agadir northeastward to Algeria, and contain several of the highest peaks of North Africa, among them Mount Toubkal (13,665 feet). South of the Grand Atlas are the Anti-Atlas Mountains, with volcanic Mount Siroua (about 10,900 feet); while extending northeastward from the Grand Atlas chain are the Middle Atlas Mountains, with Bou Naceur (10,794 feet). Between the Atlas

ranges and the northern coastal mountains is the Taza corridor, providing the principal rail and motor route to Algeria.

The rivers flow generally northwestward to the Atlantic, or southeastward toward the Sahara; an exception is the Moulouya (Muluya) which flows northeastward from the Grand Atlas on a 350-mile course to the Mediterranean. Principal rivers with outlets in the Atlantic are the Oum er Rebba, Sebou (Sebu), Bou Regreg, Tensift, and Sous (Sus). The Wad Dra (Oued Dra) flows eastward from the Atlas, turns southwestward on the Algerian border, and completes its course in the Atlantic at the southern border with Rio de Oro. Other southward-flowing rivers, notably the Ziz (Zis) and Ghéris (Ghir), periodically diminish or disappear entirely in the Sahara. The Atlantic coast offers few natural harbors, but efficient port facilities have been built at Casablanca, which handles most of Morocco's external trade, and at Safi, which is linked by rail with the mining center of Louis Gentil and with Marrakech. Port Lyautey is an important center on the lower Sebou.

The People.—The total population of Morocco in mid-1953 was estimated by United Nations sources at 9,439,000, including 8,220,000 in the French zone (as compared with 8,617,387 at the 1947 census); 1,035,000 in the Spanish zone (1,082,009 at the 1945 census); and 184,000 in Tangier. The large nonindigenous population included 362,814 Europeans (chiefly French) and 199,156 native Jews in the French zone in 1951, and 72,184 Europeans and 14,196 native Jews in the Spanish zone in 1945. The largest concentration of Europeans is in Casablanca (134,690 in 1951). Spaniards are numerous in the coastal towns.

Principal cities in the French zone (population according to the 1951-1952 census) are: Casablanca, 682,388; Marrakech, 245,312; Fez, 179,372; Rabat, the capital, 156,209; Meknès, 140,380; Oudjda, 80,546; Safi, 56,751; Port Lyautey, 55,905; Salé, 46,582; Mazagan (El Jedida), 34,781; and Mogador, 22,291. Spanish zone cities (with 1945 population figures) include: Tetuán, the capital, 93,658; Larache, 41,286; and Alcazarquivir, 35,786. The cities of Melilla (1948 est., 94,319) and Ceuta (1948 est., 67,790) are Spanish presidios on the northern coast of Spanish Morocco.

Morocco's earliest inhabitants of record were Berber tribesmen who roamed the African coasts while Rome was extending her Mediterranean empire. The Berbers continue to form a majority of the native population, Arab tribes constituting the second largest indigenous element. These two Moslem groups are closely intermingled, with admixtures in some native tribes of African Negro stock. Jewish settlers in Morocco date from pre-Christian times; living principally in towns, their numbers were augmented by Jews expelled from Spain and Italy by edicts of the Inquisition. The Berbers are concentrated largely in the northern regions of Er Rif, the plains of the Middle Atlas, and the Sous Valley. Arab tribes are distributed principally along the Atlantic coastal plains, in the Moulouya and Sebou valleys, and in the eastern plateaus of the Grand and Middle Atlas.

Moorish Arabic has been increasingly spoken since the European occupation, and is now the predominant language. French and Spanish are the official languages in the respective protector-

ates, but numerous Berber dialects (principally the Zenatiya, Tamazirt, and Tashelhit) survive among some two million tribesmen in the more remote mountainous regions.

Except in the more modern cities, the unit of Moroccan social organization remains the tribe, headed by a kaid and sometimes consisting of a number of clans. Many of the old Moorish customs exist today, although the influence of European civilization has brought considerable change to urban areas. The proximity of the modern, well-constructed cities to the ancient walled towns with their picturesque gardens, fountains, mosques, mosaics, and narrow corridors emphasizes the curious blending of the new and the old in Morocco. While a new, well-to-do urban class of merchants and professional people has developed since the establishment of the French protectorate, there still remains the illiterate, impoverished peasants at one end of the economic scale, and the rich, powerful pashas at the other, with few interests in common except their Islamic faith and pride in their Moorish culture and history.

Natural Resources.—Morocco has become the world's third largest producer of cork, taken from extensive stands of cork oak forest in the Atlantic coastal region. Forests of evergreen oak, cedar, and pine are found on the slopes of the Atlas. Juniper and thuya trees growing near the Mediterranean yield oils and fragrant gums, while date palms are cultivated in many valleys of the Atlas, and the oil-yielding argan tree, unique in Morocco, is found in the Sous Valley. Alfa grass, used to make paper pulp, is grown on the eastern steppes of the Atlas. Maritime resources, developed since 1934 into important industries, include sardines, anchovies, and tuna.

Minerals in French Morocco have been exploited along modern lines since 1920 when the government began operating the Khouribga and Louis Gentil phosphate mines, which by 1953 were producing over 4 million metric tons annually, or about one sixth of the world's supply. There are large deposits of manganese, of which some 430,000 metric tons were mined in 1953. Production of lead had risen by 1953 to 110,000 metric tons, including some 70,000 tons from the Bou Beker mines. Other important minerals (with 1953 production figures) are hard coal (565,000 metric tons); iron ore (505,900 metric tons); and petroleum (102,600 metric tons). Zinc, cobalt, salt, and antimony also are mined on a smaller scale. The aggregate value of the mining industry in French Morocco increased from 22,000 million francs in 1950 to 37,500 million francs in 1953. Iron ore production in Spanish Morocco totaled 970,100 tons in 1952, and lead, antimony, graphite, and manganese ore were mined on a small scale.

Agriculture.—The area of land under cultivation in French Morocco increased from about 7 million acres in 1928 to more than 12 million acres in 1953; a corresponding increase in productivity has rewarded the efforts of the French administrators to introduce modern methods of agriculture. Major crop yields on an aggregate area of 4,556,000 hectares in 1951-1952, an average season, were estimated as follows, in thousands of metric tons: barley, 1,200; hard wheat, 480; soft wheat, 320; and corn (maize), 290. Also grown are citrus fruits (about 185,000 metric tons in 1951-1952), olives (160,000 metric tons in 1951-1952), sorghum, beans, chick-peas, and flax.

Cork oak forests cover some 776,000 acres, and vineyards, about 50,000 acres. Although occupying only about 7 per cent of the arable land, farms owned by Europeans produce 15 per cent of the grain harvest and 80 per cent of the citrus crop. Livestock in 1953 included about 13 million sheep, 8 million goats, and 3 million cattle. Animal products include annually some 4 million hides and skins, and some 12,000 tons of wool. Almonds, figs, cherries, plums, peaches, apples, and pomegranates are also grown for local consumption.

French policy, taking into account the large areas of land owned and operated collectively by native farmers and herdsmen, has introduced agricultural education and encouraged co-operatives and provident societies which assist small farm owners with loans. Modern equipment is being supplied in the rural areas. Agriculture is less well developed in the Spanish zone, where the chief crops are barley, wheat, sorghum, and olives.

Irrigation and Power.—The related hazards of drought and flood have been reduced by the construction of several large dams since 1930, among them the Sidi Said Machou, Kasba Zidania, Im Fout, and Daourat dams on the Oum er Rebja; El Kansera Dam, near Sidi Slimane, on the Beth; Cavaignac Dam on the N'Fis; and the Bin el Ouidane works on the El Abid. These and other smaller projects have been designed to control floods, to multiply the number of water supply points for livestock, and to reduce the incidence of malaria, as well as to provide water for irrigation. Modern irrigation methods have been applied successfully in arid areas of the Sous and Wad Dra valleys. By 1951, the total irrigated area had risen to about 500,000 acres, from 200,000 acres in 1946. Morocco has insufficient coal for her growing industries, for which power must be furnished indirectly by water. Four main dams, with a total capacity of 48.2 billion cubic feet, provide between 50 and 60 per cent of the electricity generated in a year of average rainfall. Electric power consumption, from less than 60 million kilowatt-hours in 1930, increased to 698 million kilowatt-hours by 1953.

Industrial Development.—Until after World War I, a flour mill in Casablanca had been the only large-scale industrial plant in French Morocco. French economic planning has sought to retain traditional native handicrafts, including the making of leather goods, carpets, saddles, furniture, basketwork, ceramics, embroidery, and jewelry, while adjusting the economy to a rapidly growing population, a widespread movement from the land into industrial centers, and the goal of a higher living standard for the population as a whole. Handicrafts employing some 130,000 workers (1953) are organized by a department of arts and crafts, have their own banks for credit, and produce many valuable articles for both domestic and overseas markets, including some 4 million pairs of Turkish slippers annually (233,000 pairs exported in 1953). Moroccan weavers produce more than 80,000 square yards of carpet annually.

First importance is given to food production, in which 120,000 persons (1953) find factory employment. Cheese, vinegar, chocolate, soap, paste, and cigarettes are produced; other industrial plants include breweries and distilleries, sugar refineries, oil and rice mills, and canneries handling fish, fruits, and fruit juices. By 1953, 31 flour mills in French Morocco had an output of 254,400 metric tons. Some 40,000 workers (1953) are

engaged in lime, cement, and cork factories, and in foundries, machine shops, stone and marble quarries, and other adjuncts of the construction industries. In place of the traditional *babouche* the native population has adopted boots and shoes of which 720,000 pairs were manufactured in 1953. Forty-one factories were engaged in 1953 in meta-manufactures. The fishing fleet, employing 9,000 persons (7,600 Moroccans) in 1953, has an annual catch, principally of sardines, anchovies, and tuna of more than 120,000 metric tons (128,714 tons in 1953).

External Trade.—Principal exports from French Morocco, in order of value, are: phosphates, canned fish, barley, manganese ore, citrus fruit, lead, and dried vegetables; principal imports are sugar, textiles, tea, coffee, cereals, vehicles, machinery, and petroleum products. An adverse trade balance was reported in 1953, when exports (60 per cent to the franc area) totaled 93,822 million francs (95,848 million in 1952) and imports (60.7 per cent from the franc area) amounted to 103,874 million francs (180,534 million in 1952). The United States ranked second as a source of imports in 1952 (15,987 million francs), followed by Cuba (6,657 million) and Germany (5,511 million); while Germany ranked second as a market for exports (8,285 million francs), followed by the United Kingdom (7,902 million) and French West Africa (4,101 million).

The bulk of Spanish Morocco's external trade is with Spain and other Spanish possessions. Imports, including flour, sugar, tea, soap, clothing, automobiles, and petroleum products, amounted to some 806.8 million paper pesetas in 1951; while exports in the same year, including iron ore, fish products, goatskins, palm fiber, and lumber, amounted to 306.8 million paper pesetas.

Tangier serves as an entrepôt point for the supply of the Mediterranean area, and in modern times has been a center for black market dealings in restricted currencies and goods. With the post World War II recovery of western European nations, the zone has lost some of its advantage as a haven for flight capital and a source of prohibited American luxury goods. Tangier's imports in 1953 were valued at 11,628.2 million francs, and exports, 969.6 million francs.

Transportation and Communication.—A primitive system of trails traversed only by pack animals has given way to a modern network of roads (about 28,200 miles in French Morocco in 1953, of which 6,300 miles were surfaced; about 540 miles in Spanish Morocco; and 65 miles in Tangier). The railroad system, begun in 1922, consists of standard-gauge lines totaling 1,054 miles in 1951 (984 miles in French Morocco, 88 in Spanish Morocco, and 12 in Tangier) and connecting with lines from Algeria and Tunisia. A main strategic line links Marrakech, Casablanca, Port Lyautey, Meknès, Fez, and Taza with Oudjda on the Algerian frontier.

Of the eight seaports on the Atlantic coast, Casablanca is by far the most important. With modern machinery and accommodation for the largest vessels, it ranks third among the ports of the French Union. Morocco is linked directly by air with Algiers, Oran, Paris, Bordeaux, Marseille, Perpignan, Lisbon, Rome, and Dakar. Casablanca-Cazes is a principal airport; there are also airports at Salé (near Rabat), Meknès, Oudjda, Marrakech, Achdir, Fez, Tetuán, Tangier, and other cities.

There is telephone service in all towns

French Morocco, in Tangier, and in the larger towns of Spanish Morocco; and there are connections between Tangier and Madrid and Lisbon. Telegraph service exists in most towns, and there is cable service to France, Spain, and Gibraltar. There is a Sherifian postal service in the French zone, and a Spanish service in the Spanish zone; a British postal system is maintained in Tangier. A broadcasting system is operated from the four stations (1953) of Radio-Maroc; there were some 217,000 radio receivers in French Morocco in 1953. A television transmitter was constructed at Casablanca in 1954, with a relay to Rabat. Of seven daily newspapers in French Morocco 1953, five were in French and two were in Arabic.

Currency, Banking, and Investment.—The current French monetary system in French Morocco was established in 1920, the Moroccan franc having parity with the French metropolitan franc since 1928. Heading the banking system in the French zone is the State Bank of Morocco, established in 1907; in addition to minting operations and purchasing coinage metals for the administration, it maintains an exclusive right of issue. From its principal office in Tangier, the bank's operations are conducted through branches in ten cities in French Morocco and six cities in Spanish Morocco. A principal function of the 31 banks (1952) in the French protectorate is the granting of credits to agricultural and construction projects.

French investments in Morocco comprise both public and private capital, the former being drawn mainly from the "Fund for the Modernization and Equipment of Morocco," a development of the "Moroccan Plan in France." Under two quadrennial development plans (1949-1952 and 1953-1956), public investment was devoted largely to social welfare, medical research and care, agriculture, hydroelectric construction, and mining; while private investment was concentrated principally in commercial projects and industries producing consumer goods.

The official currency in the Spanish zone is the paper peseta (3,577 paper pesetas equal 1 gold peseta). Both the franc and the peseta are used in Tangier. Chief sources of revenue are customs duties, income from government monopolies, and taxes on agricultural products and consumer goods.

Government.—Promulgated by *dahirs* (imperial edicts) and exercised through a grand vizier serving as prime minister in the traditional *Makhzen* (central government), the sultan's power in the Sherifian Empire was formerly absolute in both religious and civil spheres. A few viziers in the imperial court communicated the sultan's will to the pashas and kaids (representing his civil authority in urban and rural areas, respectively) who executed the imperial commands on the local level. This power was increasingly curtailed after the division of Morocco into French, Spanish, and international zones, each with its own system of government.

French Zone.—Actual authority in the French zone, following establishment of the protectorate in 1912, was centered in the French administration, headed by a resident general who also served as foreign minister to the sultan. The sultan's power was first modified by the creation of technical administrative departments (*grandes directions*) in the *Makhzen*, headed by French specialists. In 1947, the *Makhzen* was enlarged by six new members, and high Moroccan officials began to be asso-

ciated with finance, agriculture and communications, public health, and social affairs. In that year there also was created a Council of Viziers and Directors (enlarged in 1953) to present matters of legislation to the sultan.

The French administration, and the relationship of the sultan with it, were considerably altered in 1953 as a result of several reforms aimed at democratizing the state and eventually removing all traces of absolutism from its administrative and judicial systems. By *dahirs* of Aug. 12 and Aug. 31, 1953, the Limited Council, a body of six members headed by the grand vizier, was instituted to assume executive powers previously held by the sultan. The Government Council, a body of French and Moroccan members appointed by the protectorate to advise on financial and economic matters, was created in 1919 and reorganized in 1932, 1947, and 1953. In the latter year (by *dahir* of October 13) the council was made a wholly elected instrument of the Sherifian state, and thus became the basis for Morocco's first parliamentary body.

Important strides toward self-government were made in 1955 after the return to the throne of Sultan Sidi Mohammed ben Youssef. On Dec. 7, 1955, the protectorate's first representative government was installed, while at the same time the sultan renounced his absolute authority, to become Morocco's first constitutional sovereign (see below under *History*).

Spanish Zone.—The Franco-Spanish Convention of Nov. 27, 1912, recognized the Spanish protectorate in Morocco. The powers of the sultan were delegated to a caliph (*khalifa*), selected by the sultan from two candidates proposed by the Spanish government, and subject to control by the Spanish high commissioner resident at Tetuán. In 1948, a grand vizier was given responsibility for native affairs.

International Zone of Tangier.—The convention of Dec. 18, 1923, among Great Britain, France, and Spain, provided for the Tangier Statute which became effective June 1, 1925, and which was modified on July 25, 1928, when Italy also became a participating power. In 1945, the United States, Great Britain, France, and the Soviet Union agreed in Paris to a temporary international administration, pending the completion at some future time of a new convention by the signatory powers of the Act of Algieras (1906). The Tangier Statute provided for a *mendoub* who would represent the sultan, and who subsequently presided over an appointive Legislative Council. The administration is headed by an administrator, who is aided by assistant administrators for public health, finance, justice, and other activities. A Committee of Control, consisting of the consuls general of Great Britain, Belgium, France, Italy, the Netherlands, Portugal, Spain, and the United States, has the right of veto. The Spanish government has control of the zone's special police force.

Education.—Most of the native population remains illiterate, with less than 30 per cent of the native school-age population (mostly boys) attending school. Until 1912, traditional Koranic *msids* (private schools) taught reading, and apt pupils continued their studies in the mosques. Natives now receive a limited education from Koranic elementary schools, and from several secondary schools operated in connection with mosques, among the latter the best known being the Kairoween University at Fez. Schools for Jewish

children are provided by the Alliance Israélite, with government aid. For the European population, there is a school system similar to that of France. Higher institutions at Rabat include the Institut des Hautes Études Marocaines, with faculties of law, science, and Arabic; the Institut Scientifique Chérifien; the Moroccan School of Administration; and a training school for Moslem teachers. There are also several technical, commercial, and other schools for Moslem, European, and Jewish students.

In the Spanish zone, the Delegation of Education and Culture since 1941 has supervised Moslem, Spanish, and Jewish educational and cultural facilities. A Moslem industrial school and two schools of Arabic culture are located at Tetuán. In Tangier, the various participating governments have set up their own schools, and there are some Moslem and Jewish schools for natives.

Total school enrollment in French Morocco in 1952 was estimated at about 530,000, including 288,231 in public schools (174,860 Moslems, 80,348 Europeans, and 33,024 Jews); about 62,000 in private schools; and about 180,000 in the traditional Koranic schools.

History.—Morocco first appears in history as the farthest westward extension of the Carthaginian Empire. With the fall of Carthage and the subsequent consolidation of Roman power in Africa, the provinces of Mauretania Caesariensis and Mauretania Tingitana were founded about 25 B.C. The colonies flourished until overrun, like Rome herself, by the Vandals in the 5th century. Reconquered by the Roman general, Belisarius, in 533–534 A.D., Mauretania remained under Roman (Byzantine) jurisdiction for another century, only to fall before Arab invaders under Okba (Uqbah ibn-Nafi) who swept over northern Africa in 682. By 711, Tariq ibn-Ziyad, then in control of the Tangier area with a force of Arabs, Egyptians, and Berbers, was able to invade Spain by way of Gibraltar.

The Idrisid Dynasty.—The Berber tribes, who occupied the country from the earliest historical times, were united under the sovereignty of successive Moorish dynasties, beginning with that of Idris I (Idris ibn-Abdullah, or Idris the Elder), who was enthroned at Volubilis (north of present-day Meknès) in 788 with the title of imam, or spiritual and temporal leader of Islam. His son, Idris II, founded the capital city of Fez about 800. The Idrisid dynasty lasted until the year 974, when it was overthrown by the Berbers. Two Berber dynasties—the Maknasa and the Maghrawa—followed briefly.

The Almoravids and Almohades.—Rising in the Sahara Desert in the early 11th century, the powerful Moslem sect of the Almoravids (Mura-bits) extended its conquests over northern Africa and ultimately into Spain. Its chief, Abdallah ibn-Yasin, was proclaimed ruler over Morocco in 1055, inaugurating the Berber dynasty in which his grandson, Yusuf ibn-Tashfin, founder of the city of Marrakech in 1062, succeeded him. A number of rulers of the Almohade (Muwahhid) dynasty followed the overthrow of the Almoravids near Tlemcen in 1147 by Abd al-Mumin, who captured Morocco and southern Spain.

The Merinide and Wattasi Dynasties.—Driven out of Spain in 1232 by the Christians, and defeated in Morocco in 1269, the Almohades gave way to the Merinide (Beni Merin) dynasty, which flourished until the middle of the 14th century under abu-Yusuf (r. 1258–1286), abu-

Ya'qub (Yusuf IV, r. 1286–1307), abu-Said (r. 1310–1331), abu-al-Hassan (r. 1331–1351), and abu-Inan (r. 1351–1358), and then went into a decline for another century, giving way to the Wattasi (Beni Wattas) dynasty, from 1471 to 1550. During this time there was an influx of Portuguese settlers to the Atlantic coastal cities, beginning with the capture of Ceuta in 1415.

The Sa'adi Dynasty.—In the 16th century a new monarchical line began with the descendants of the Hasan, or Sa'adi, sherifs (nobles), who were partly of Arab stock. The Sa'adians entered Morocco from the southeast through the Dra Valley, conquered Marrakech (1520) and Fez (1548), and proceeded to force the Portuguese out of all western ports except Mazagan. The fifth of the Sa'adi dynasty, Ahmed al-Mansur, "the Victorious" (also known as el-Dhehebi, "the Golden"), who ruled from 1578 to 1603, captured Timbuktu (1591) and was soon master of all of Morocco. His reign is regarded as the golden age in Moroccan history; some of the structures erected by him in Marrakech still survive. At this time there grew up the system of primitive feudalism known as the *bled el Makhzen*—the Makhzen tribes who offered their military services to the monarch in exchange for exemption from taxes. Zidan (r. 1608–1628), who also left notable buildings, was his most eminent successor.

The Alaouite Dynasty: Mohammed XII to Mohammed XVI.—The Alaouite dynasty (also known as the Filali or Hassini), of mixed Arab and Berber descent, originated among the Filali sherifs of the Taflelt oasis area of southeastern Morocco, and continued to modern times. Opposing the influence of both Europeans and certain *Marabouts* (Islamic hermits or saints) in North Africa, the Alaouites expanded their power quickly and occupied Fez in 1649. Their first sultan, Mohammed XIV, ruled from 1649 to 1664. He was followed by Rashid II (r. 1664–1672), who made Marrakech his capital in 1668, and by Mulai Ismail, "the Bloodthirsty" (r. 1672–1727), who kept Morocco strongly fortified, heavily patrolled, and closely united through an elaborate system of bodyguards, fortresses, roving armies, and foreign legionnaires. He also beautified his capital at Meknès, drove the Spanish from Larache, took Tangier from the English, and in 1682 established diplomatic relations with France. After his death a period of disorder followed until the accession of Mohammed XVI (r. 1757–1789), who captured Mazagan from the Portuguese (1769).

The Growth of European Influence.—Piracy and the holding of prisoners for ransom were flagrantly practiced in Morocco, in common with other Barbary states, from the 16th to the 19th centuries. Nevertheless, communication and trade with European powers, particularly the French, English, Dutch, and Spanish, became increasingly important. A treaty guaranteeing the safe movement of French ships and establishing a favored status for French consuls was signed with Louis XV in 1767. As a result of the conquest of Algeria by France in 1830, Abd-er-Rahman (r. 1822–1859) aided the Arab leader in Algeria, Abd-el-Kader, and subsequently both were defeated at Isly in 1844 by the French under Thomas Robert Bugeaud de la Piconnerie. The beginning of the reign of Sidi Mohammed (Mohammed XVII, r. 1859–1873), Spain invaded northern Morocco, capturing Tetuán in 1860. British intervention prevented further Spanish

conquests, but in 1893, during the reign of El Hasan III (r. 1873-1894) the Spanish penetrated further inland, thereby obtaining slight boundary concessions and an indemnity of some \$3 million by a treaty signed in 1894.

European influence in Morocco increased during the weak reign of Abd-al-Aziz IV (r. 1894-1908), when insurgent tribes of northern and central Morocco were in revolt, and lawlessness prevailed throughout much of the country. On May 18, 1904, Ahmed-ibn-Muhammed Raisuli, a Moroccan brigand, captured and held for ransom Ion Perdicaris, an American citizen, and his stepson, a British subject. The ultimatum of United States Secretary of State John Hay, "Perdicaris alive or Raisuli dead," followed by a demonstration by American warships and representations from European courts, compelled the sultan to comply with United States demands, and the captives were released. To safeguard her interests, France arranged to police Tangier with French Algerians, and a French military mission proceeded to Fez.

By the Franco-British Treaty of April 8, 1904, France declared her "disinterest" in Egypt, and Britain yielded to France responsibility for seeing to "the tranquillity of the country" (that is, Morocco) and for helping to bring about needed "administrative, financial and military reforms" there. Freedom of trade was guaranteed for 30 years in Egypt and Morocco. On Oct. 3, 1904, a Franco-Spanish agreement recognized the earlier Franco-British agreement; the maintenance of the territorial integrity of Morocco; the right of France to give the sultan military, economic, and financial assistance; and modified the limits of the Spanish zone of influence. This agreement was further implemented by secret clauses in 1905 and 1907.

German Intervention: The Algeciras Conference.—In the meantime, Germany began to take an active interest in the events transpiring in Morocco. By the Madrid Convention of 1880, Austria, Belgium, Denmark, Germany, France, Great Britain, Italy, Morocco, the Netherlands, Portugal, Spain, Sweden, Norway, and the United States had agreed upon the right of protection in Morocco. According to Article 17 of the treaty: "The right to the treatment of the most favored nation is recognized by Morocco, as belonging to all the Powers represented at the Madrid Conference." Germany's exclusion from the Franco-British agreements with Morocco in 1904 was interpreted as a violation of her rights under the Madrid Convention; and accordingly, on March 31, 1905, the German emperor, William II, visited Tangier where he assured the sultan of his intention to uphold the integrity of the Moroccan kingdom and the equality of Germany's commercial and economic interests there. A special German mission was sent to Fez, and was followed by British and Spanish missions, ostensibly to support French interests and policy.

After protracted discussions with the sultan, it was agreed that an international conference should be held at Algeciras in Spain; and delegates of the countries signatory to the Madrid Convention of 1880 met there in conference on Jan. 16, 1906. After strenuous opposition and counterproposals on the part of Germany (supported only by Austria) against the French program, agreement was reached in favor of the French. The Act of Algeciras, signed on April 7, 1906, and accepted by the sultan on June 18 of

that year, reiterated the principle of commercial equality in Morocco, and provided for a joint Spanish-French police force in Morocco's ports. The various diplomatic representatives at Tangier were charged with effecting the specified administrative and economic reforms.

Establishment of the Protectorates.—The murder of Dr. Emile Mauchamp on March 19, 1907, at Marrakech resulted in the occupation of Oudjda by the French. Abd-al-Hafiz (Mulai Hafiz) took the throne in 1908 following the deposition of his brother, Abd-al-Aziz IV, but was himself forced to abdicate in favor of Mulai Yusef in 1912. Meanwhile, in July 1911, Germany dispatched the cruiser *Panther* to Agadir to protect the concessions of German financiers, and was assured the support of local chiefs in any resistance she might make against French paramountcy in the country. Great Britain hastened to assure France of her support, and a diplomatic crisis ensued among the great powers. Extended Franco-German negotiations resulted in two agreements of Nov. 4, 1911, virtually recognizing a French protectorate in Morocco but assuring German interests absolute equality in economic and commercial matters, and ceding to Germany about 250,000 square kilometers in the northern French Congo.

Thus the way was cleared for the Franco-Moroccan treaty of March 30, 1912, signed at Fez, whereby the sultan recognized the establishment of what amounted to a French protectorate in Morocco. Subsequent negotiations with Spain resulted in the agreement of Nov. 27, 1912, defining Spanish rights and interests in the Spanish northern zone. In the meantime, Gen. Louis H. G. Lyautey was appointed French resident general, and began pacification of the country which was in revolt against the sultan. The campaign of pacification proceeded slowly, extending beyond World War I, and was complicated by German operations conducted from Tangier.

Pacification Problems and Abd-el-Krim.—The pacification of the Spanish zone was not so successful, however, as a result of troubles among the Riffs. Following a successful attack on the Spanish forces at Annual in July 1921, the Riffian leader, Abd-el-Krim, conducted guerrilla operations against the Spanish, forcing them out of part of the northern zone by 1924, and creating a political crisis in Madrid. In 1925, Abd-el-Krim carried the fighting into neighboring French territory, and large reinforcements of French troops were dispatched to join the Spanish in a joint campaign under Marshal Henri Pétain. Abd-el-Krim surrendered on May 26, 1926, and was exiled to Réunion. Thereafter the French continued to subdue rebellious tribes in the vicinity of Taza, on the western slopes of the Atlas, and in the Sous Valley. Uprisings in the Grand Atlas in 1933, and in the Anti-Atlas in 1935 were put down, and by the latter year peace had been restored in the French zone.

Internationalization of Tangier.—The area about Tangier remained in dispute until the convention of Dec. 18, 1923, by France, Great Britain, and Spain, providing for the demilitarization of the zone and its administration by an international Committee of Control. Urged by Mussolini to make the Mediterranean an "Italian sea," the Italian Navy threatened Tangier and forced a conference at Paris in 1928, in which the Tangier Statute of 1923 was revised by the Paris Protocol

of July 25, to give Italy representation on the Tangier committee.

After the fall of France in June 1940, officials of the German Armistice Commission penetrated Morocco in great numbers, and German "tourists" began flocking to the country. On June 14, 1940, native troops under Spanish command marched out of Spanish Morocco into Tangier, and in the following November the commanding officer, Col. José Yuste, proclaimed himself governor and declared international control at an end. In March 1941, the mendoub was ejected from the zone. In 1945 the Big Four Allies in World War II agreed to restore the international administration and asked Spain to withdraw from the zone; the last Spanish occupying forces were withdrawn on Sept. 6, 1945, and on October 11, international control was restored.

World War II.—United States forces landed on the Moroccan coast on Nov. 8, 1942, preliminary to operations in the European theater during World War II. At Casablanca, President Franklin D. Roosevelt and Prime Minister Winston Churchill met secretly, Jan. 14-24, 1943, in one of the most important conferences of the war. With the coming to power of the Vichy government in France, Gen. Auguste Nogues remained in office in Morocco under Admiral Jean Darlan, who had been accepted by the United States as high commissioner; but in June 1943, Nogues was compelled to resign. Special measures introduced in Morocco during the German occupation of France were abolished, and large detachments of Moroccan troops took part in the campaign for the liberation of France, 1944-1945. Three United States Air Force bases were established in French Morocco in 1952, and the country was used as a base for Allied operations during most of the war.

The Growth of Nationalism.—Growing nationalist sentiment in French Morocco came more into the open after the removal of General Nogues in June 1943 and the subsequent reorganization of the French administration in accordance with the more democratic policies of the Committee for National Liberation. The nationalist Istiqlal Party soon organized demonstrations in the larger cities and eventually received some support from the sultan, Sidi Mohammed ben Youssef, who had succeeded Mulai Yusef in 1927, and who began advocating termination of the protectorate.

On Aug. 14, 1953, a conference of some 300 kaidas, pashas, and Berber tribal chieftains at Marrakech, under the leadership of the pro-French pasha of Marrakech, Thami el-Mezuari el-Glaoui, decided to depose the sultan on the grounds that he had compromised his position by departing from Moslem orthodoxy and by allying himself with the Istiqlal Party. A week later, on August 21, following bloody clashes between nationalists and police in Oudjda and other cities, Sidi Mohammed ben Moulay Arafa, also of the Alaouite dynasty, was proclaimed the new sultan at Rabat. The French then proceeded to effect a series of administrative reforms (see section on *Government*), aimed at paving the way for Moroccan self-government.

Rioting, terrorist bombings, and assassinations continued sporadically through 1954 and into 1955 as the more extreme nationalists, backed by the Arab nations, demanded the return of the deposed sultan, Sidi Mohammed ben Youssef, who had been removed by the French from Corsica to Madagascar early in 1954. Spanish officials in 1954 rejected the authority of the new sultan,

declaring that the Spanish zone would continue under the caliph appointed by ben Youssef until self-government would eventually be realized. On Aug. 20, 1955, 47 French men, women, and children were massacred by Berber tribesmen at Oued Zem, and within a period of two days at least 200 French and natives were killed in riots.

By Aug. 12, 1955, the French cabinet had come to a decision to ask the sultan to form a government which would be representative of all elements of the Moroccan population. When this plan failed, the French government called a group of Moroccan nationalists to meet with five French cabinet members (headed by Premier Edgar Faure) at Aix-les-Bains for discussions beginning August 22. The conference ended on August 27 with both sides in agreement on measures designed to restore order to Morocco and to inaugurate reforms leading to self-government.

Events then moved quickly in the closing weeks of 1955. The Aix-les-Bains agreement was soon sanctioned by the French government, which, after consulting the deposed sultan ben Youssef, approved on September 12 a plan for the honorable retirement of ben Moulay Arafa and the establishment of a Council of the Throne which would form a representative Moroccan government. The four-member council was instituted on October 15, but failed to form a government. On October 29, ben Moulay Arafa (who had vacated the throne on October 1) announced his abdication; and on November 5, ben Youssef (who had been brought to France from exile in Madagascar) was recognized as sultan by the French government. A joint statement by ben Youssef and the French Foreign Ministry on November 6 promised negotiations leading to Morocco's independence as "a democratic state with a constitutional monarchy" while remaining "united with France by the permanent links of an interdependence freely consented and defined." Sultan ben Youssef made a triumphal return to Rabat on November 16, and on December 7 he installed a nationalist cabinet headed by M'barek Bekkai and at the same time relinquished his absolute authority in order to become Morocco's first constitutional sovereign.

MOROCCO, city, French Morocco.
MARRAKECH.

MOROCCO, type of leather. See **LEATHER**
AND **SHOE TRADE TECHNICAL TERMS.**

MORON, mō-rōn' (in full MORÓN DE LA FRONTERA), municipality, Spain, situated in Sevilla Province, near the Guadaira River and about 35 miles east-southeast of Seville, with which it is connected by rail. It is the trading center for a district raising wine grapes, olives, grain, and live-stock, and has establishments producing cement, pottery, shoes, and soap. There are red hematite mines and marble quarries nearby. Morón contains the ruins of a Moorish castle destroyed by the French in 1811 and a Gothic church. Pop. (1950) 30,137.

MORON. See MENTAL RETARDATION.

MORONI, mō-rō-nē, or **MORONE**, mō-rō-nē, **Giambattista**, Italian painter: b. Albino, near Bergamo, Italy, ?1525; d. Brescia, Feb. 5, 1578. A member of the Brescian school, he was a pupil of Il Moretto. He painted a number of altar-pieces but is best known for his portraits, which were highly regarded by Titian and are said to have influenced Sir Anthony van Dyck. Among them are a portrait of Antonio Navagero in the Brera Gallery, Milan; a self-portrait and one of Conte Secco Suardo in the Uffizi, Florence; *A Jailer*, in the National Gallery, London; *A gentleman in Adoration Before the Madonna*, in the National Gallery, Washington; and a portrait of Bartolomeo Bongo, in the Metropolitan Museum of Art, New York.

MOROS, mō-rōz, Moslem Filipinos of Mindanao Island, where they live chiefly in the provinces of Cotabato, Lanao, and Zamboanga; the Sulu Archipelago, southwest of Mindanao; and southern Palawan Island. When the Spaniards arrived in the Philippines in the 16th century, they called the Filipinos converted to Islam Moros (Moors), meaning "Mohammedans." The name is still used popularly as a group name for Mohammedan Filipinos. According to the 1948 census, 4.1 per cent of the Filipinos are Mohammedans—a small minority in a largely Christian nation.

Some of the best-known Moro groups are the Yakans (Basilan Island); the Lanao Filipinos (divided into the Maranaos and Ilanums or Iranums); the skilled metalworkers known as Magindananos (Cotabato River Valley); who made bronze cannons (*lantaka*) before the Spaniards' arrival; and the Sulu Moros, who are noted as superb navigators. The Samals, often known as sea gypsies, are Moros who live on the immediate shore or in boats; those Moro Filipinos who dwell only on boats are called Badjaos (Bajau).

History.—The people of Sumatra were converted to Islam in the 13th century. These Mohammedanized Malays pushed northward through Borneo and Jolo into Mindanao, where Islam probably gained its first foothold in the middle of the 15th century. By the time the Spaniards appeared, there were Moro groups as far north as Mindoro and southwestern Luzon, and the explorer Miguel López de Legazpe found an estimated 80,000 of them inhabiting the shores of Manila Bay. The Spanish conquest of the Philippines stopped the spread of Islam in the islands. Mohammedanism in Mindanao might not have survived if the Spaniards had not been occupied in the early 17th century with Dutch occupation of Formosa and their attack against Manila, necessitating withdrawal to Luzon.

Soon the Spaniards and the Moros were at war—a conflict that lasted almost until the final days of Spanish sovereignty in the Philippines. Two important causes for the fighting were Spain's attempt to make Mindanao and Sulu colonies and to convert the Moros to Christianity. The Moros were organized into sultanates under the control of sultans, some of whom claimed descent from Mohammed himself. The absolutism of the sultans varied with their personal qualities. Under each sultan were *datos* (local chiefs), who assisted him in the administration of his sultanate. This political organization gave the Moros a military efficiency which was not possessed by other Filipinos.

In retaliation for Spanish expeditions against their homeland the Moros raided and sacked Christian Filipino communities in the Visayan Islands and as far north as Luzon. Travelers may still see the crumbling stone towers where Filipinos once watched to warn their people of marauding Moro fleets. With the introduction of the steamship and a better-organized military program, Spain was able to halt the Moro raids. Yet when she ceded the Philippines to the United States in 1898, her control over the Moro regions was largely ineffective.

Mindanao and Sulu were placed under a military government during the first years of American rule in the Philippines. Most Moros resisted United States attempts to govern their lands. It was during the military campaigns to pacify the Moros in 1903 that John J. Pershing gained world fame as a military leader. In 1914 civil government was established in the Moro regions, and in the following year the sultan of Sulu abdicated his rights of sovereignty, recognizing the United States (the sultanate was finally terminated in 1940). By 1922 four of the seven provinces of Mindanao and Sulu elected their own governors. Moro Filipinos have the same political rights as Christian Filipinos, and some of them are prominent national leaders. In the 1950's, however, the Philippine government had to send troops to quell some dissident Moro groups in Mindanao and Sulu.

DONN V. HART,

Social Science Foundation, University of Denver.

MOROSINI, mō-rō-sē-nē, **Francesco**, Italian general: b. Venice, Italy, 1618; d. Nauplia, Greece, Jan. 6, 1694. A member of a patrician Venetian family which included a number of doges and scholars, he joined the Venetian armed forces in 1636. From 1645, Venice was at war with the Turks, and Morosini was four times in command of the Venetian forces: 1657–1661; 1666–1669; 1684–1688; and 1693–1694. On the second occasion, in 1669, he was compelled to yield Candia, Crete, to the Turks in order to save its starving garrison, but in 1685–1687 he conquered the Peloponnesus, winning the sobriquet of Peloponnesiaco. In 1688 he became doge of Venice.

MOROTAI, mō-rō-tī', island, Indonesia, situated in the Moluccas, 15 miles northeast of Halmahera, from which it is separated by Morotai Strait. It has an area of 695 square miles. See **WORLD WAR II—Island-Hopping in the Pacific** (Capture of Morotai). Pop. (1930) 7,833.

MORPETH, municipal borough, England, situated in Northumberland, on the Wansbeck River, 14 miles north of Newcastle. The trading

center for an agricultural region, it has establishments producing leather, woolen cloth, beer, and iron and brass products. In medieval times, Morpeth was a fortress in the warfare on the Anglo-Scottish border. The 14th century gatehouse of its castle still stands, and there are ruined castles nearby. In the town are a 14th century church, a clock tower, and a town hall designed by Sir John Vanbrugh. Pop. (1950) 10,797.

MORPHEUS, môr'fûs; popularly, môr'fê-ûs (from Gr. *morphê*, form or shape), in Greek mythology, the god of dreams. The son of Hypnos or Somnus, the god of sleep, he is usually represented as a slumbering child. As his name implies, he shapes men's dreams.

MORPHINE, môr'fên, an alkaloid of opium. The name is derived from the Greek god Morpheus (q.v.). Chemically, morphine is a complex derivative of phenanthrene that contains two OH groups (one phenolic, the other alcoholic) in which the hydrogen can be replaced by alkyl or acid radicals to form such substances as codeine, thebaine, and heroin. The chemical nature of these radicals modifies the effects on the body. For example, the replacement of one hydroxyl group by a methyl group (codeine) diminishes the narcotic and respiratory depressant actions but increases the convulsant action. When both OH groups are replaced by acids (diacetyl morphine), the narcotic effects are stronger than with codeine, and the convulsant action is weaker than with morphine.

Morphine was first isolated about 1805 by Friedrich W. A. Sertürner, a German pharmacist. Subsequently it was shown that most of the effect of opium is due to its morphine content. Morphine is available as morphine hydrochloride and morphine sulphate, the latter being the form commonly used medicinally. Both salts appear as white crystals or powder having a bitter taste but no odor. They darken if left exposed to light and lose water if exposed to air. The chemical formula for morphine sulphate is $(C_{17}H_{19}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$.

Although morphine is useful medically, particularly for the relief of pain, it has undesirable properties and may cause constipation, vomiting, excitement instead of calmness, and depression of respiration. It also causes a severe drug addiction that is very difficult to control. When an overdose of the drug is taken, death occurs from respiratory failure.

Morphine has been and still is used to some extent for the control of pain in expectant mothers just before delivery. Other drugs are used to better advantage, however, and are substituted whenever possible because morphine can pass from mother to child through the placenta and cause difficulty in breathing in the newborn infant.

The manufacture and distribution of morphine, like that of all narcotic drugs, is under the Harrison Narcotic Act of 1914. Such drugs can be dispensed only by doctors holding a narcotics license, which must be renewed yearly.

See also CODEINE; OPIUM.

AUSTIN SMITH, M.D.,
Editor, "Journal of the American Medical Society."

MORPHOGENESIS, môr-fô-jên'ê-sîs, has been defined by the English biochemist Joseph

Needham as "the coming-into-being of characteristic and specific form in living organisms." This involves an exceedingly complex and intricately regulated sequence of events, processes, and changes (growth and differentiation), resulting in development from egg to mature form, and according to the organism's own characteristic organization. Two groups of processes are responsible for development: (1) constructive or progressive processes that contribute to building up the organism—(a) growth, or the actual increase in living matter through synthesis and storing up new protoplasm, (b) morphogenetic movements, which transport new protoplasm to places where new form appears, and (c) differentiation, which becomes increasingly apparent through differences in chemical composition detectable between stages; and (2) limiting processes, which are either external such as limited food supply, or internal such as hormones and chemical inductors that guide the expression of hereditary characters (genes). Also characteristic of development is the early appearance of polarity (apex and base), which is present even in some eggs. The orderly sequence of events and changes during development is brought about by determination, which controls the ultimate fate of all parts of an embryo.

Numerous ingenious and delicate micrurgical experiments with eggs and developing embryos, especially those of amphibians, echinoderms, worms, and other groups, involving ablation (removal), addition (implantation), exchange (transplantation), and fusion, have disclosed two quantitatively different types of eggs: (1) mosaic eggs, whose parts are clearly determined from the earliest stages; and (2) regulation eggs, in which determination begins at a later stage. The latter are particularly suitable for experimental study, for alteration of development is possible by experiment. In vertebrate eggs, best known of those studied, determination is initiated by a controlling region (primary organization center), located near the blastopore. Secondary and tertiary organization centers appear later. The ability of an embryo to develop normally or nearly so or to regenerate after experimental interference is called regulation.

The modern study of morphogenesis involves methods, data, and points of view of morphology, physiology, biochemistry, genetics, physics, and mathematics. A completely satisfactory and universally acceptable theory of morphogenesis must mold all these into a logical, consistent whole.

THEODOR JUST.

MORPHOLOGY, môr-fôl'ô-jî, the division of biological science which deals with the form and structure of animals and plants. The term, which is derived from the Greek word *morphê* (form), was originated by Johann Wolfgang von Goethe. It includes anatomy and histology and, in part, embryology and cytology. For the morphology of animals, see ANATOMY, COMPARATIVE; for that of plants, see PLANTS AND PLANT SCIENCE—1. *Classification, Morphology, and Evolution*; 2. *Anatomy*.

MORPHY, Paul Charles, American chess player: b. New Orleans, La., June 22, 1837; d. there, July 10, 1884. He learned chess at the age of 10, and at 12 had defeated many local amateurs. He was educated at Spring Hill College and at the University of Louisiana, where he studied

aw for several years, occasionally playing a game. In 1857 at the first American chess congress held in New York, he had no difficulty in defeating his strongest opponents. During the next year, in England, he successfully met such players as Henry E. Bird, Boden and J. J. Löwenthal, and astonished the world of chess by playing as many as eight games simultaneously and without the board. His playing in Paris, where he won five games out of eight against Harrwitz, and exhibited his blindfold skill, was equally surprising. In 1859 he returned to the United States and here met the famous German player Adolf Anderssen, winning 7 of 11 games. Being now admitted to the bar, Morphy began to practice law in his native city; but his mental powers had been so impaired by the strain of his blind-fold chess-playing that he not only gave that up but relinquished chess entirely, and a little later abandoned all intellectual work. Morphy's skill at chess appeared to partake of the quality of genius. His brilliant achievements were not the result of long or deep deliberation, yet displayed all the elements usually observed when mental strength and quickness are sustained by profound study. Consult Löwenthal, *J. J. Morphy's Games of Chess* (London 1860).

MORRELL, Imogene Robinson, American artist: b. Attleboro, Mass.; d. Philadelphia, Nov. 22, 1908. She was married to Abram Morrell in 1869. She studied art in the United States and Europe and was a pupil of Adolf Schrodter at Dusseldorf and of Thomas Couture at Paris (1864). In 1874 she returned to America, opened a studio at Washington as a portrait and historical painter, and there established and became first president of the Washington National Academy of Fine Arts (1879). Some of her more notable paintings are *The First Battle of the Puritans*; *Washington Welcoming the Provision Trains at Newburgh, N. Y.*; *A Historical Portrait of General John A. Dix*.

MORRILL, mor'ril, Anson Peaslee, American politician: b. Belgrade, Maine, June 10, 1803; d. Augusta, Maine, July 4, 1887. He at first engaged in business in his native town, then in 1834 was sent to the state legislature; was sheriff of Somerset County 1839-40; and in 1850 land agent. In 1853 he was an unsuccessful candidate for governor on the Prohibition and Free-Soil tickets, but the following year he was elected as the first Republican governor of Maine, and later was a delegate to the convention which nominated John C. Fremont. In 1860 he was elected to Congress, but declined a re-election.

MORRILL, Justin Smith, American senator: b. Strafford, Vt., April 14, 1810; d. Washington, D. C., Dec. 28, 1898. He received a good primary and secondary education, was a merchant and then a farmer; was first elected to the House of Representatives in 1854. In 1867 was transferred to the Senate, in which he was long chairman of the committee of Finance. With his 12 years in the lower house and 31 in the upper, he was more closely connected with Congress than any other man of his time, and was styled "The Father of the Senate." His Land-Grant College Act, approved by President Lincoln in 1862, for the creation of seats of learning in newly-settled states, has,

with supplemental legislation, resulted in the erection of some 70 colleges. He introduced the war revenue tariff of 1861, commonly called the Morrill tariff, and during his later years consistently opposed the remonetization of silver. Senator Morrill wrote *The Self-Consciousness of Noted Persons* (1886).

MORRILL, Lot Myrick, American politician: b. Belgrade, Maine, May 3, 1812; d. Portland, Maine, Jan. 10, 1883. He was educated at Waterville College (now Colby University), studied law and was admitted to the bar in 1839, when he went to Augusta and established a law practice. He took an active part in politics, in 1853 was elected to the state legislature, and in 1856 was chosen president of the Senate. He was governor of his state 1858-60, and in the latter year was elected to the United States Senate, where he proved himself an indefatigable worker. He favored the resumption of specie payment and was an authority on financial, naval and Indian affairs. In 1876 he retired from the Senate to become secretary of the treasury under President Grant, and during his administration of that office constantly urged the return to specie payment. He declined an appointment to a foreign mission under President Hayes, and in 1887 became collector of customs at Portland, Maine, in which office he died.

MORRILTON, Ark., town and Conway County seat; altitude 347 feet; on the Missouri Pacific Railroad; 50 miles northwest of Little Rock. In the county, livestock and cotton are raised, and the city's industries are meat packing and the making of cottonseed oil, cloth, and cheese. Pop. (1940) 4,608; (1950) 5,483.

MORRIS, Anthony, American Quaker: b. London, Aug. 23, 1654; d. Philadelphia, Pa., Oct. 23, 1721. In 1683 he settled in Burlington, West Jersey, moving three years later to Philadelphia where he acquired wealth in brewing. He was at various times alderman and mayor of the city, also served in the provincial council and the assembly. He was a founder of the William Penn Charter School.

MORRIS, Charles, English song writer: b. 1745; d. near Dorking, Surrey, July 11, 1838. In 1764 he entered the 17th Foot, with which he served in America, later exchanged into the Irish Dragoons and then into the 2d Life Guards. In 1785 he was made bard of the Beefsteak Society, and before its gatherings sang many of his wittiest efforts. He was a boon companion and associate of Charles James Fox and the Prince Regent (George IV). His humor and vivacity led John Philpot Curran to say, "Die when you will, Charles, you will die in your youth." He wrote hundreds of songs, many being political ditties for the Whigs; and a posthumous volume, *Lyra Urbanica* (1840) collected them. His *A Reason Fair to Fill my Glass* was praised by Thomas Moore and set to music by Charles Dibdin.

MORRIS, Charles, American naval officer: b. Woodstock, Conn., July 26, 1784; d. Jan. 27, 1856. Entering the navy in 1799, he participated in the war with Tripoli, was an actor in the recapture of the *Philadelphia*, in the harbor of Tripoli (1804), being the first to gain her

deck when she was boarded. At the outbreak of the War of 1812 he was serving as executive officer of the *Constitution*; he was wounded in the engagement of *Old Ironsides* with the *Guerrrière* (August 1812); and afterward successfully commanded the *John Adams* until, being blockaded by a British squadron in Penobscot River, he was compelled to destroy his ship to save her from being taken by the enemy. In the war with Algiers (1815) he commanded the *Congress*, and it was he who, in the *Brandywine*, carried Lafayette home to France (1825). After serving for some years as naval commissioner and as supervisor of the United States Naval Academy he became chief of the bureau of ordnance and hydrography, which position he held till the time of his death. Consult his *Autobiography* (1880).

MORRIS, Charles, American author: b. Philadelphia, Pa., Oct. 1, 1833; d. Sept. 6, 1922. Educated in Chester, engaged for a short period in teaching; for a considerable time was manager in a manufacturing concern; and after 1878 devoted himself to literary work. His publications include *A Manual of Classical Literature*; *Historical Tales* (11 vols.); *The War with Spain*; *Our Island Empire*; *Man and his Ancestor*; *Famous Men and Great Events of the Nineteenth Century*; *Home Life in All Lands*; a series of histories of the United States; *History of the World and History of Pennsylvania*, for schools; *Heroes of America* (4 vols.); *The Nations of Europe*; *Famous Days and Deeds in Belgium and Holland*, and various others. He also compiled *Half Hours with the Best Authors* (18 vols.); *Elocution, Oratory and Entertainment* (4 vols.); *The Famous Orators of the World*; and *Handy Dictionary of Biography*. He edited *Winston's Universal Dictionary*; *The International Dictionary*; and *Winston's Encyclopedia*.

MORRIS, Clara, American actress: b. Toronto, Canada, 1849; d. New Canaan, Conn., Nov. 20, 1925. She became leading lady in Wood's Theater, Cincinnati, Ohio, and in the winter of 1869-1870, joined Augustin Daly's Fifth Avenue Company, New York. She at once achieved success in emotional rôles and afterward made many tours throughout the United States. Her leading rôles include *Camille*; *Alix* in the *Countess de Sommeville*; *Mercy Merrick*; *Miss Multon*; *Lady Macbeth*; *Leah the Forsaken*; and *Cora* in *L'Article 47*. After her retirement from the stage she wrote much for periodicals and published in book-form *A Silent Singer* (1899); *My Little Jim Crow* (1900); *A Pasteboard Crown*, fiction (1902); *Stage Confidences* (1902); *The Trouble Woman* (1904); *The Life of a Star* (1906); *Left in Charge* (1907); *New East Lynne* (1908); *Dressing Room Receptions* (1911). She was married to F. C. Harriott in 1874. In her later years she was afflicted with blindness.

MORRIS, Sir Daniel, British colonial expert: b. Loughor, Glamorgan, May 26, 1844; d. Feb. 9, 1933. He was educated at Cheltenham, at the South Kensington Royal College of Science and at Trinity College, Dublin, where he received high honors. He was assistant director of the Royal Botanic Gardens of Ceylon in 1877; investigated and checked the coffee-leaf disease; became director of the Botanic Depart-

ment of Jamaica in 1879; was commissioner in the West Indian Imperial Department 1898-1908, a member of the Canadian and West Indian Trade Commission 1909-1910; and was scientific adviser in tropical agriculture to the Colonial Office 1908-1913. He was created K.C.M.G. in 1903. Among his publications are *Cacao: How to Grow and How to Cure it* (1882); *Agricultural Resources of Saint Helena* (1884); *The Vegetable Resources of the West Indies* (1888); *Sisal Industry of the Bahamas* (1896); *Report to the West India Royal Commission on the Agricultural Resources of the West Indies* (1897); and *Forest Resources of Newfoundland* (1916).

MORRIS, Edward Joy, American author: b. Philadelphia, Pa., July 16, 1815; d. there, Dec. 31, 1881. He was graduated from Harvard in 1836 and was admitted to the bar in 1842. He was a member of the Pennsylvania legislature in 1841-1843 and of Congress in 1843-1845, and in 1850 was appointed to a mission in Naples, where he remained four years. He was again in Congress as a representative of Pennsylvania in 1858-1861, and from 1861-1870 was Minister to Turkey. He published *Notes of a Tour through Turkey, Greece, Egypt, Arabia Petraea to the Holy Land* (2 vols., 1842), as well as translations of works on Turkey, Norway, and Corsica, and numerous magazine and newspaper articles.

MORRIS, Edward Parmelee, American Latinist, best known as a Plautine scholar: b. Auburn, N. Y., Sept. 17, 1853; d. Nov. 16, 1938. He was graduated at Yale in 1874, studied at Leipzig and Jena, was professor of Latin at Williams 1885-1891, and at Yale, and edited the following plays of Plautus: *Mostellaria*, *Pseudolus* (1890), and *Captives and Trinummus* (1898); *Horace's Satires* (1909) and *Epistles* (1911); *Sentence-Questions in Plautus and Terence*; *The Subjunctive in Plautus*; *On Principles and Methods in Latin Syntax* (1902).

MORRIS, George Perry, American journalist: b. Montclair, N. J., Feb. 18, 1864; d. June 12, 1921. He was educated at Rutgers College and Johns Hopkins University, and in 1891 was associate editor of *The Congregationalist*. In 1888-90 he was on the editorial staff of the *New York Mail and Express*, on *The Congregationalist*, Boston, in 1891-1907 and on the staff of the *Boston Herald* 1907-1911. He was on the staff of the *Christian Science Monitor* (1911-1918). He has published *The Norwegian Company System* (1894); *Historic Towns of New England* (1898). He was a contributor to various magazines, especially character studies of living notables.

MORRIS, George Pope, American journalist and poet: b. Philadelphia, Oct. 10, 1802; d. New York, July 6, 1864. With Samuel Woodworth (q.v.), in 1823, he founded the *New York Mirror*, a weekly journal of literature, afterward published as the *New Mirror* and the *Evening Mirror*, in which many of the early writings of Bryant, Poe, Halleck, Willis and other American authors first appeared. In 1845 Morris established the *National Press*, which in the following year became the *Home Journal*, and which, with the assistance of N. P. Will (q.v.), he continued to edit almost to the

of his life. He wrote *Brier Cliff* (1826), a popular drama based on incidents of the American Revolution, and the libretto of a three-act opera, *The Mad of Saxony* (1842, music by Charles Edward Horn), based on the career of Frederick the Great. The final collection of his *Poems* (4th ed., 1800) contains *Near the Lake, My Mother's Tale, We Were Boys Together, A Long Time Ago*, and the familiar *Woodman, Spare that Tree*.

MORRIS, Gouverneur, gŭv-ēr-nēr', American statesman and diplomat: b. Morrisania, now part of the Bronx, New York, N. Y., Jan. 31, 1732; d. there, Nov. 6, 1816. He was the grandson of Lewis Morris (1671-1746), jurist, royal governor of New Jersey, and first lord of the manor of Morrisania; and the son of Lewis Morris (1698-1762), also a jurist, second lord of the manor. His mother, Sarah Gouverneur, was of French Huguenot descent. Lewis Morris (1726-1798), signer of the Declaration of Independence, and last lord of the manor, was his elder half-brother.

Gouverneur Morris graduated from King's College (now Columbia University) in 1768, and was admitted to the bar in 1771. During the early differences between Great Britain and the American colonies, like most of the New York landed aristocracy, with their dread of social upheaval, Morris hoped for a compromise leading to reunion with the mother country; but after the battle of Lexington he identified himself wholeheartedly with the colonial cause, and in 1775 he was a delegate of Westchester County in the revolutionary provincial congress of New York. A member of this assembly until 1777, Morris became a leader of the moderates and an ardent defender of the authority of the Continental Congress at Philadelphia and of the power of a central government as against the governments of the colonies.

Chosen a delegate to the Constitutional Convention of New York in 1776, he was a member of the committee, on which Robert Livingston and John Jay also sat, which drafted the state's first constitution. During Burgoyne's invasion of 1777, Morris was a staunch supporter of Gen. Philip Schuyler, and with Jay he made a futile trip to Philadelphia to prevent Schuyler's being superseded by Horatio Gates.

From 1778 to 1779, Morris was a member of the Continental Congress, and on an official visit in inspection to Valley Forge he became a lifelong admirer of George Washington and one of the ablest defenders of Washington's military policies. During his term in Congress, Morris drafted several important papers, including *Observations on the American Revolution* (1779), a report on the negotiations relative to Lord North's abortive proposal of conciliation with the colonies in 1778; the instructions to Benjamin Franklin as minister to France; and instructions to the envoy to be appointed to negotiate a treaty of peace with Great Britain. John Adams was subsequently entrusted with this mission, and the instructions drafted by Morris were the basis of important provisions in the Treaty of Paris of 1783.

Defeated for re-election to Congress in 1779, Morris moved to Philadelphia and resumed the practice of law. From February to April 1780 he contributed a series of brilliant essays on the country's finances to the *Pennsylvania Packet*, and these brought his appointment as assistant

to Robert Morris (no relative), the superintendent of finance. Serving in this post from 1781 to 1785, Morris drew up a plan for a decimal system of coinage to replace the British system, which was later adopted after being perfected by Jefferson and Hamilton.

In 1787, Morris was elected a Pennsylvania delegate to the Constitutional Convention. Taking part in many debates, he advocated a strong central government which would entirely dominate the states, a president elected for life, a Senate of men appointed for life by the president, suffrage in national elections restricted to freeholders, and he opposed the equal representation of states in the Senate; yet in defeat he loyally accepted the will of the majority and devoted his very considerable literary skill to giving the Constitution its final form.

After the convention Morris returned to live at Morrisania, which he had bought from his brother, but business soon took him to France as an agent of Robert Morris. He reached Paris in February 1789, in time to witness the beginning of the French Revolution. His diary, published as *A Diary of the French Revolution* (Boston 1939), is an important source of information on this period in French history. In 1790, Morris was appointed a confidential commissioner to treat with Great Britain regarding the controversies over debts, trading posts, and commercial privileges that had arisen from the Treaty of Paris. The disappointing results of this mission nearly cost Morris the office of minister to France, to which he was appointed in 1792.

Unknown to his government, Morris at this time was deeply involved in a plot to help Louis XVI escape from Paris. At considerable personal risk, Morris remained in that city until 1794, when he and the French minister to the United States, E. C. E. Genêt, were recalled simultaneously. This practically ended his political life, although he served as United States senator from 1800 to 1803, filling an unexpired term. In 1810 he became chairman of the Erie Canal Commission, a project he had been actively promoting for some 25 years.

Both his background and his business career had made Morris a convinced Federalist, and in later years his disgust with Jefferson's administration drove him to extremes. He condemned the War of 1812 and the embargo and approved the Hartford Convention; at the end of his life he seems to have lost all faith in the future of the country he had labored so long to establish.

(New York 1888); Roosevelt, Theodore, *Gouverneur Morris* (Boston and New York 1888); Walther, Daniel, *Gouverneur Morris, Witness of Two Revolutions*, tr. by E. Denniston (New York and London 1934); Davenport, B. C., ed., *A Diary of the French Revolution* (Boston 1939); Swiggett, Howard, *The Extraordinary Mr. Morris* (New York 1952).

MORRIS, Gouverneur, American writer: b. New York, N. Y., Feb. 7, 1876; d. Gallup, N. Mex., Aug. 14, 1953. A banker and a prolific writer of magazine short stories and popular novels, Morris was a great-grandson of Gouverneur Morris (1752-1816). Among his books were *Tom Beauling* (1901), *Aladdin O'Brien* (1902), *When My Ship Comes In* (1915), *We Three* (1916), *The Wild Goose* (1919), *Yellow Men and Gold* (1921), and *Tiger Island* (1934).

MORRIS, Sir Henry, English physician: b. Petworth, Sussex, Jan. 7, 1844; d. June 14, 1926. He was educated at Epsom College and University College and studied medicine and surgery at Guy's Hospital, London. He delivered the Cavendish lecture (1893); Hunterian lectures (1898) and was Bradshaw lecturer at the Royal College of Surgeons (1903), and afterwards distinguished himself frequently on the lecture platform. He was former surgeon and lecturer in anatomy and surgery at Middlesex Hospital Medical College, examiner in surgery at University of London and in anatomy at University of Durham. He was for six years Chairman of the Court of Examiners of Royal College of Surgeons, president of the Royal Society of Medicine (1910-1912) and Royal College of Surgeons (1906-1909). He was created baronet 1909. Among his literary works are *Anatomy of the Joints of Man* (1879); *Surgical Diseases of the Kidney and Ureter* (1885); *Gynecology* (1891); *Injuries and Disease of the Genital and Urinary Organs* (1895); *Treatise on Human Anatomy* (1898; 4th ed., 1907); *Injuries of the Lower Extremity*. His *Treatment of Inoperable Cancer* (1902) and *Suggestion in Relation to the Treatment of Disease* (1910); *Looking Back, or from Superstition to Research—Christian Science Refuted* (1909), all contributed to his reputation.

MORRIS, Henry W., American naval officer: b. New York, 1806; d. there, Aug. 14, 1863. He entered the navy in 1819 and in 1828 was made lieutenant. He was on duty in New York and various other stations from 1839 until 1855, when he was fleet captain in the Mediterranean under Commodore Silas Stringham. In 1861 he superintended the completion of the *Pen-sacola*, and in 1862 took command of her, successfully passed the Confederate fortifications on the Potomac and took a distinguished part in the battles at Fort Jackson, Fort Saint Philip and Chalmette. He guarded New Orleans after its capture, but failing health necessitated his return to the North, where he soon after died. He was promoted commodore in 1862.

MORRIS, John, English Jesuit: b. Ootacumund, India, 1826; d. 1893. He studied (1845) at Trinity College, Cambridge, became (1846) a Roman Catholic, was ordained (1849), and became vice rector of the English College, Rome (1852-1855). Returning to England he was appointed secretary to Cardinal Wiseman and to his successor Cardinal Manning. He entered the Society of Jesus in 1867, was rector of Saint Ignatius College, Malta (1877-1878), was made professor of canon law and church history at Saint Bruno's College, Saint Asaph (1879) and was rector at Roehampton 1880-1886. He wrote *Condition of Catholics under James* (1871); *The Troubles of our Catholic Forefathers* (1875); *Cardinal Wiseman's Last Illness* (1871); *Life and Martyrdom of Saint Thomas Becket* (2d ed. 1885). Consult Pallen, J. H., *Life and Letters of Father John Morris* (London 1896).

MORRIS, John Gottlieb, American Lutheran clergyman: b. York, Pa., Nov. 14, 1803; d. Lutherville, Md., Oct. 10, 1895. He was graduated from Dickinson College in 1823 and studied theology at the Princeton and Gettysburg seminaries, receiving his license to preach in 1826. He founded the first English Lutheran church of

Baltimore and was in charge of it from 1827-1860, after which he held various important charges. He was chiefly instrumental in the founding of the College for Women in Lutherville and of the town. From 1834 until his death he was lecturer at Pennsylvania College, and he also lectured in the Smithsonian Institution at Washington. He was prominently connected with scientific and religious societies, and founded the *Lutheran Observer* in 1831 which he edited until 1833. He was librarian of the Peabody Institute at Baltimore, 1860-1865. Among his many publications are *Catechumen's and Communicant's Companion* (1831); *Life of John Arndt* (1853); *Fifty Years in the Lutheran Ministry* (1878); *The Stork Family in the Lutheran Church* (1886), etc.

MORRIS, Lewis, American statesman, b. New York, Oct. 15, 1671; d. Kingsbury, N. J., May 21, 1746. He practiced law in New York and New Jersey in 1692, became one of the governor's council and a member of the assembly and drew up and presented to Queen Anne the complaint against Governor Cornbury formulated by the assembly. From 1710-1738 he was chief justice of New York and New Jersey, in 1731 was acting governor of New Jersey, in 1738 was prominent in effecting the separation of New Jersey from New York, and from 1738 until his death was governor of New Jersey.

MORRIS, Lewis, American patriot, one of the signers of the Declaration of Independence, b. Morrisania, Westchester County, N. Y., Apr. 8, 1726; d. there, Jan. 22, 1798. After being graduated from Yale College in 1746 he engaged in farming on a very extensive scale on his paternal estate at Morrisania. He took strong ground against the act of Parliament compelling the inhabitants of the province of New York to furnish with supplies the foreign troops quartered upon them. He was elected to the Congress of 1773 was a member of the committee to devise means for supplying the colonies with munitions of war, and after the close of the session was sent west to detach the Indians from the British. In 1776 he resumed his seat in Congress, and signed the Declaration of Independence, although his estate was at that time in the hands of the enemy. As a consequence his manor was laid waste and his family expelled. In 1777 he was succeeded in Congress by Gouverneur Morris, his half brother, but afterward served in the state legislature. The latter part of his life was spent at Morrisania. He was one of the boldest and most zealous promoters of the American Revolution.

MORRIS, Sir Lewis, Welsh poet: b. Carmarthen, Wales, Jan. 23, 1833; d. London, England, Nov. 12, 1907. He was graduated from Jesus College at Oxford, studied law and was admitted to the bar of Lincoln's Inn in 1861, practicing until 1881. Was deputy chancellor of University of Wales and prominently associated with the cause of education. In 1895 he was knighted. His verse was fluent, the utterance of simple truths in unaffected language, and it was very popular, but deficient in strength, his *Epic of Hades* (1876-1877) going through many editions. Other volumes of his verse are *Songs of Two Worlds* (1872), *Gwen: a Drama in Monologue* (1879); *The Ode of Life* (1880); *Songs Unsung* (1883).

'Vision of Saints' (1890); 'Harvest Tide' (1901); 'The Life and Death of Leo the Armenian' (1904); 'The New Rambler: From Ask to Platform' (1905), etc.

MORRIS, Mary Philipse, American Tory: Philipse Manor, New York, 1736; d. York, England, 1825. She was one of the famous Philipse family, daughter of the second lord of the Manor, Frederick Philipse. A beautiful brunette, she is the original of Cooper's heroine 'The Spy,' and was long said to be one of George Washington's loves; but the story that he rejected him is untrue. Two years after meeting Washington she married George Morris (1758), an English officer, with whom she lived what was afterward Washington's headquarters and the Jumel house. Her property was confiscated at the opening of the Revolution and she went to England. Her surviving children, being free from attainder according to the ruling of the English Attorney-General, sold their rights to John Jacob Astor for \$100,000, and the British government paid them more for their losses.

MORRIS, Robert, American financier and statesman, a signer of the Declaration of Independence; b. Liverpool, England, 31 Jan. 1734; Philadelphia, 8 May 1806. He came to the colonies about 1747 and entered at Philadelphia a counting-room of Charles Willing, merchant; in 1754 formed a partnership with Thomas Willing maintained until 1793; acquired a very considerable fortune for the America of that time; and despite his strong loyalty to England, opposed the Stamp Act and signed the non-importation agreement of 1765. In October 1775 he was elected to the provincial assembly, and in 1776-78 was a member of the Continental Congress. On 2 July 1776 he voted against the Declaration of Independence and on 7 July absented himself; but on 2 August he was one of the signers. When hostilities began his services became of increasing value. When Congress fled from Philadelphia to Baltimore on 12 Dec. 1776, Morris was left in charge of its affairs, and when it reassembled at Baltimore on 20 December was made with George Clymer of Pennsylvania and George Walton of Georgia a committee for the execution of Continental business. Morris did all that was done. Most of the business of the colonies during December and January was transacted by him; he prepared American ships for sea, assumed charge of incoming freights and supplied Washington with money. On 20 Feb. 1781 he was elected superintendent of finance. He found the treasury in a disordered state through a vastly depreciated paper currency, and at the lowest point in the fortunes of the Continental army borrowed money on its own credit and was the instrument in the difficult task of financing the war. He presented to Congress a plan for the organization of the Bank of North America, accepted 28 May; and himself subscribing \$39,200 worth of shares. The bank was incorporated 31 Dec. 1781 and began operation 7 Jan. 1782. Morris resigned January 1783, but on request did not retire until 1 Nov. 1784. He was a member of the Pennsylvania assembly in 1776-78, 1778-79, 1780-81, 1785-87. In 1787 he was a member of the convention that framed the United States constitution. He declined the Secretaryship of

the Treasury, and was United States Senator from Pennsylvania in 1789-95. With James Greenleaf and against Washington's advice, he entered land speculation, held vast territories, especially in the western half of New York State in anticipation of immigration after the war, and purchased in the new city of Washington 6,000 lots at \$80 each, and agreeing to build yearly 20 brick houses. Largely through the defaulting of his partner he was compelled to make an assignment, and was imprisoned for debt at Philadelphia from 19 Feb. 1798 to 26 Aug. 1801. The influence of his credit, his ability in raising loans and his financial skill were of the utmost importance to the struggling cause of the Revolution; and it is generally admitted that he was a momentous force in Washington's administration and fully earned the title of the "Financier of the Revolution." Consult Sparks, 'Diplomatical Correspondence of the Revolution' (1829-30); the 'Life' by Sumner (1892) in the 'Makers of America' series; Rolles, 'Financial Administration of Robert Morris' (1878), and Oberholtzer, 'Robert Morris: Patriot and Financier' (1903).

MORRIS, Thomas, American statesman: b. Augusta County, Va., 3 Jan. 1776; d. Bethel, Ohio, 7 Dec. 1844. He removed in 1795 to Columbia, Ohio, and was employed by the Rev. John Smith, the first senator from Ohio. He fixed his residence in 1800 in Clermont County, studied law, was admitted to the bar, was a member of the State legislature from 1806 to 1830, was a judge of the State Supreme Court (1815-21), and in 1832 was elected to the United States Senate as a Democrat, where he distinguished himself as an opponent of slavery and was engaged in important debates with Calhoun and Clay in defense of the right of petition and of the duty of the general government to discourage slavery. His anti-slavery sentiments rendered him distasteful to the Democratic party, by which he had been elected, and he permanently retired in March 1839. In 1844 he was nominated for Vice-President by the Buffalo convention of the Liberty party, on the ticket with J. G. Birney (q.v.) for President. Consult the 'Life' by F. B. Morris (1856).

MORRIS, William, English poet and artist: b. Walthamstow, Essex, 24 March 1834; d. Hammersmith, London, 3 Oct. 1896. He was educated at Marlborough College and Exeter College, Oxford, where he began a lifelong friendship with Edward Burne-Jones. Both were attracted by the Anglo-Catholic revival, and intended to enter the Anglican priesthood, but early abandoned that resolve, and was for some nine months a pupil in the office of the noted architect, George Edmund Street. In 1856 he founded *The Oxford and Cambridge Magazine*, to which he contributed often, and which he published at his own expense for the year it was issued. Two years later (1858) appeared 'The Defense of Guinevere and Other Poems,' in the pages of which the temper of the Middle Ages may be said to find its most accurate modern interpretation. In 1867 he published the 'Life and Death of Jason,' an epic of 17 cantos in heroic couplets, which showed him to be a teller of stories *par excellence*. By this time he had definitely entered upon his career

of weaver anew of old tales from classic or mediæval sources, and the next year (1868) appeared the first volume of 'The Earthly Paradise,' a series of stories retold from classical and mediæval originals, but with a mediæval setting. A second and third volume followed in 1869 and 1870, the entire work comprising 24 tales with the addition of interludes and preludes and 12 lyrics of the months. In 'The Earthly Paradise,' as in the 'Jason,' Morris took Chaucer for his master as well in the structure of his verse as in what may be termed the processional nature of his descriptive passages. Three verse forms are employed by him, the seven-lined decasyllabic stanza known as the Chaucerian heptastich, the four-foot couplet and the heroic couplet. 'The Earthly Paradise' includes some 40,000 lines, but when once the reader has fallen under the poet's sway his leisurely manner will not be found wearisome. In 'The Lovers of Gudrun,' one of the tales of 'The Earthly Paradise,' Morris had already turned to Iceland for a theme and in 'The Story of Sigurd the Volsung and the Fall of the Niblungs' (1876) he returned to Icelandic myth for his subject. The poet regarded this poem as his masterpiece and in the opinion of not a few critics it ranks as almost the greatest, if not the greatest epic of the 19th century. In his hands the ancient myth becomes alive and throbs with all the intensity of primeval passion. Besides these works Morris published also in verse 'Love is Enough, or the Freeing of Pharamond' (1872); 'The Æneids of Virgil done into English verse' (1875), in which the metre adopted is that of Chapman's Homer; 'The Odyssey of Homer done into English verse' (1887); 'The Dream of John Ball' (1888), and 'Poems by the Way' (1892).

In 1859 Morris married Miss Jane Burden. In 1861 he founded the firm of Morris, Marshall, Faulkner and Company and began the manufacture of wall-paper, stained glass and artistic furniture, and to his labors in this particular is traceable much of the reform which English and American trade has experienced in household art during the last generation. In 1890 he established the Kelmscott Press at Hammersmith, and there published exquisitely printed editions of Chaucer, Beowulf and other works, as well as of his own writings. Still another side of his nature was shown in the trend of his human sympathies. He had long been known as poet and craftsman, but from 1885 he was active as a social reformer, lecturing frequently to workingmen in halls or in the open air, and helping to support the *Commonwealth*, a Socialist journal. It is not wholly easy to understand this side of his nature, for intensely democratic as he became, in theory at least, he was an equally intense lover of that very beauty which a social upheaval would destroy. The ugliness of much of modern life led him to Socialism, but he was thoroughly sincere in his attitude, illogical as it may seem to many. However difficult it may be to adjust satisfactorily to our minds the attitude of the poet-Socialist with the character of his work as a craftsman, which was offered to the world at prices practically prohibitory for the majority of persons, it is an unquestionable fact that the world is a pleasanter, wholesomer world for his having lived in it. He helped

his generation to perceive that there is no necessary alliance between utility and ugliness, he raised the standard of household taste, and, as a poet he was one of the most melodious of his time. In his later years he essayed a form of composition in mingled prose and verse greatly enjoyed by many, though perhaps not wholly to the taste of those who liked him best, as the author of 'The Earthly Paradise' and 'Sigurd'—a series of romances beginning with 'The Tale of the House of the Wolfings' (1889), and succeeded by 'The Roots of the Mountains' (1890); 'News from Nowhere' (1891); 'The Story of the Glittering Plain' (1891); 'The Wood beyond the World' (1894); 'The Well at the World's End' (1896); 'The Water of the Wondrous Isles' (1897), and 'The Story of the Sundering Flood' (1898). With Erikir Magnusson, the Icelandic scholar, he published 'The Story of Grettir the Strong' (1869); 'Volsunga Saga' (1870), and 'Three Northern Love Stories and Other Tales' (1875). Still other works by him are 'The Decorative Art' (1878); 'Hopes and Fears for Art' (1882); 'Signs of Change' (7 lectures, 1888); with Belfast Bax, 'Socialism: Its Growth and Outcome' (1893), 'Architecture, Industry and Wealth' (1903). Morris received a tentative offer of the laureateship on the death of Tennyson, but his socialistic theories would have suited ill with the post, and he indicated that it would not be acceptable to him. He was a devoted admirer of mediæval architecture, and his account in the 'Earthly Paradise' of the front of Peterborough cathedral is one of the finest descriptions of an architectural feature to be found in English literature. He has also written informative and interesting monographs on mural painting and related subjects. See EARTHLY PARADISE, THE. Consult the 'Lives' or studies by Cary (1902); Clutton-Brock (1914); Jackson, Holbrook (1908); Mackail (1899); Noyes, Alfred (1909); Vallance (1897); Riegel, 'Die Quellen von William Morris's Dichtung, "The Earthly Paradise," in Erlanger Beiträge zur englischen Philologie' (1890); Warwick, 'William Morris, His Homes and Haunts' (1912); 'Collected Works of William Morris' (20 vols., London 1913), and Saintsbury, 'Corrected Impressions' (1895).

MORRIS, William O'Connor, Irish jurist and author: b. Kilkenny, 26 Nov. 1824; d. 3 Aug. 1904. He was educated at Oxford, was admitted to the Irish bar in 1854 and was a county court judge from 1872 until his death. He wrote 'Great Commanders of Modern Times'; 'Napoleon'; 'Moltke'; 'Irish History'; 'Hannibal'; 'Ireland: 1798-1898'; 'The Great Campaign of Nelson'; 'The Campaign of 1815'; and 'Memories and Thoughts of a Life' (1895).

MORRIS, an island at the entrance to Charleston Harbor, S. C., south of the main channel. It is east of James Island, nearly a mile south of Fort Sumter and about a mile and a half from Fort Moultrie. At Cummings Point, on the north end of the island, three small batteries took part in the bombardment of Fort Sumter, 12-13 April 1861. Later Battery Wagner was constructed on the south end of the island and the batteries on the north end

were strengthened and called Battery Gregg. Attempts were made, in 1863, by the Union forces under Admiral Du Pont and General Hunter to secure possession of the island, and later by Admiral Dahlgren and General Gilmore. A landing was made on July 10 and on the 11th and 18th an encounter took place, and a regular siege began. See also FORT SUMTER.

MORRIS, city, Illinois, and Grundy County seat; altitude 504 feet; 21 miles southwest of Joliet; on the Illinois River; the Lakes to Gulf Waterway; and the Chicago, Rock Island and Pacific Railroad. The site was long occupied by Indian tribes. The first settlement was made in 1834; it was laid out in 1842 and named for Isaac C. Morris, one of the Illinois and Michigan Canal commissioners who was responsible for having the village selected as the county seat; and in 1857 the town was incorporated.

With the completion of the Illinois and Michigan Canal in 1848, the community developed rapidly and became an important shipping point for the surrounding region, a fertile agricultural area in which there are large bituminous coal fields and beds of clay used for brick and tile. Industries include food products, beverages, leather, printing machines, egg cartons, and flour mills. It is a modern public school buildings. On the western edge of Morris is the 33-acre Gebhard Woods State Park, occupying the old Canal Parkway. Pop. (1950) 6,926.

MORRIS, city, Minnesota, county seat of Stevens County; altitude 1,140 feet; on the Great Northern and the Northern Pacific railroads, about 140 miles northwest of Minneapolis. It is situated in an agricultural region devoted largely to the growing of wheat, livestock raising, dairy farming and poultry raising. There are several grain elevators, flour mills, creameries, etc. Morris is the seat of West Central Agricultural College, which was originally an Indian mission school operated by Roman Catholic nuns.

Morris attained its present status under the supervision and jurisdiction of the federal government. It is housed in 14 buildings, including administrative offices, dormitories, classrooms, etc. There is an experimental station and a weather station operated in connection with the college. There is also in Morris a National Guard armory, containing an excellent collection of war relics, representative of the Civil, Spanish-American and World wars. Nearby lakes afford excellent fishing, and wild fowl afford good shooting. Pop. (1940) 3,214; (1950) 3,809.

MORRIS DANCE, or **MOORISH DANCE**, supposed to have been derived from the Moriscos in Spain, was formerly danced at puppet-shows, etc. It was introduced into England in the reign of Edward III, when John of Gaunt returned from Spain. In the May-games morris-dancers formed an important part. Robin Hood, Friar Tuck, Little John and the Hobby Horse were introduced as characters in the dance. In the reign of Henry VIII the morris-dancers were dressed in gilt leather and silver paper, and sometimes in coats of white and spangled fustian. Suppressed by the Puritans it survives in the north of England.

MORRIS PARK, a once famous New York racetrack.

MORRIS PLAINS, New Jersey, residential borough in Morris County; alt. 405 feet; on the Delaware, Lackawanna and Western Railroad; 35 miles west of New York. Nearby is the state mental hospital. Founded about 1750, Morris Plains was incorporated in 1926. Pop. (1950) 2,707.

MORRIS PLAN, The. The Morris Plan of industrial loans and investments takes its name from a Southern lawyer, Arthur J. Morris, formerly of Norfolk, Va., but now of New York. Since 1910 Morris Plan banks or companies have operated in more than 125 cities in 30 states and the District of Columbia; the name has come by common usage to express a method of industrial banking which is so generally recognized as to have made for itself a place in dictionaries. The plan, as originated in 1910 in Norfolk, contemplated an extension of credit to men and women based on their character and earning power. The Fidelity Savings and Trust Company of Norfolk began operation of the Morris Plan on March 23, 1910, providing for Americans a type of banking service which had existed on the continent of Europe for over half a century. As reported on Dec. 31, 1951, the total assets of 58 Morris Plan banks and companies were \$956,266,566.

Until the development of the Morris Plan of making industrial loans, a would-be borrower, in need of a small amount of money to tide him over some urgent and unusual financial difficulty, usually had to rely upon the generosity of a friend or place himself at the mercy of a loan-shark. In either case, the system was bad. The amount needed might vary from \$50 to \$5,000 and the prospective borrower might be either a merchant, a salaried or professional man or woman, or a wage earner. Such a person might be unknown to the commercial banks, or, if known, perhaps owned no securities upon which he could borrow. It was to take care of such cases that the Morris Plan was developed. At a Morris Plan bank a borrower discloses his needs, and, if the statement made by him is satisfactory, is given an application blank and a note which is signed as a part of the legal procedure. In addition to the borrower's own statement and application, the company must be supplied with the statements and signatures of two of the borrower's associates, friends, or relatives, of such reputation and financial standing as are acceptable. These "endorsers," as they may be called, become "co-responsible parties" to the loan, and are legally responsible to the lending company (unless the loan has been protected by a Morris Plan insurance policy) in the event of the death or delinquency of the borrower.

The discount rate is usually 6 per cent (often less, and seldom exceeding 8 per cent). For small loans the service charge ranges up to 2 per cent. Most loans are to wage earners or small salaried workers, but many are to individuals, firms, or small corporations to facilitate business expansion.

The total number of Morris Plan loans in the period 1910-1945 amounted to 17,809,466 for an aggregate amount of \$4,681,571,654. Investment certificates were the main source of loanable funds until the mid-1930's. Today practically all Morris Plan banks are members of the Federal Deposit Insurance Corporation. Subject also to state regulations, they are authorized to accept deposits in the form of savings or checking accounts. Funds derived from this

source provide the major portion of the capital which is loaned. Thus the small saver finances the small borrower.

In 1917 the Morris Plan Insurance Society was created as an additional feature of this service. Under this system loans can be protected by the payment of a nominal fee so that in the event of a borrower's death, the obligation of the borrower's family and endorsers is canceled.

The Morris Plan Company of New York is the largest operating company. It was organized 31 Dec. 1914 with a capital of \$100,000. On 31 Dec. 1930 its working capital exceeded \$4,300,000 and its total resources were over \$49,000,000. The Company maintains 12 offices in New York.

Morris Plan borrowers do not make monthly or weekly repayments on their loans. The Plan provides a definite "thrift process" which is designed to assist the borrower in forming the habit of systematic saving. He agrees to purchase a Morris Plan certificate of a denomination sufficient to liquidate his loan when it shall become due. On this certificate monthly or weekly installments are paid. The borrower holds the certificate book, which is, in effect, his bank book. At the end of the 10 or 12 months period, which is the usual period for Morris Plan loans, the certificate has been paid for. It is then used by the borrower as collateral with which to cancel his loan.

The Morris Plan Corporation of America, located in New York City, is the organizing force for all work connected with the establishment of new banks and companies operating under this system. JOSEPH B. GILDER, *Late Secretary of the Industrial Finance Corporation.*

MORRISON, Arthur, English author: b. 1863. He was for a number of years secretary to a charity-trust in London's East End, and there made the studies utilized in his "Tales of Mean Streets" (1895), and "The Child of Jago" (1896). He wrote also "Martin Hewitt, Investigator" (1896), detective stories; "The Dorrington Deed-Box" (1897); "To London Town" (1899); "The Hole in the Wall" (1902); "The Red Triangle" (1903); "Divers Vanities" (1905); "Green Ginger" (1909); "The Painters of Japan" (1911), and he has collaborated in the production of three plays.

MORRISON, George Ernest, British traveler and Sino-expert: b. Geelong, Victoria, Australia, 4 Feb. 1862; d. 30 May 1920. He was educated at the Melbourne and Edinburgh universities, receiving (1887) degrees M.D. and C.M., crossed Australia on foot (1882-83) and crossed from Shanghai to Rangoon by land (1894); as special correspondent for *The Times* (London) he traveled from Bangkok, Siam, to Yunnan City, China, and round Tonquin (1896), and in the same capacity crossed Manchuria from Stretensk, Siberia, to Vladivostok (1897). He was in Pekin during the Boxer siege (1900) and was present at the Japanese triumphal entry into Port Arthur (1905). In 1907 he again crossed China from Pekin to the French border of Tonquin and thereafter did much travel and exploration in China and Russian Turkestan. On account of his great store of knowledge of Chinese topography and politics he was made political adviser to the President of the Chinese Republic in 1912. He wrote

"An Australian in China: being the Narrative of a Quiet Journey Across China to Burma" (1895).

MORRISON, Henry Clay, American Methodist (South) bishop: b. Montgomery County, Tenn., 30 May 1842. He was educated in the public schools and after teaching to several years entered the ministry in 1865. He received important charges in Louisville, Ky., and Atlanta, and was missionary secretary in 1890-98 when he raised \$140,000 for the Board of Missions. He was appointed bishop in 1898 and five times elected to the General Conference. He died 20 Dec. 1921.

MORRISON, James Dow, American Protestant Episcopal bishop: b. Waddington, N. Y., 1844. He was graduated from McGill University, Montreal, in 1865, took orders in the Episcopal ministry and after holding rectories at Herkimer and Ogdensburg, N. Y., was consecrated first missionary bishop of the diocese of Duluth in 1897. In 1907 he organized the diocese of Duluth of which he became first diocesan bishop. He has published "Fundamental Church Principles" (1899); "Suffragan Bishops" (1910), and also sermons and addresses.

MORRISON, John Frank, American army officer: b. Charlottesville, N. Y., 20 Dec. 1857. He was graduated from the United States Military Academy and commissioned 2d lieutenant, 20th Infantry in 1881. During his service as a subaltern and captain he was noted as a student of tactics and an authority on general military science. He served in the Santiago campaign and later in the Philippines with distinction. In the Russo-Japanese War he was selected to service as an observer and accompanied General Kuroki through the campaign from the Yalu to Liao Yang and Mukden. On his return home in 1905 he was detailed as a student to the nascent Army War College and in the following year went to Leavenworth service schools as instructor. In 1907 he became chief of the department of military art in that institution. The drastic reforms and reorganizations he there carried out led to a high degree of efficiency under his administration. During 1912 and 1913 he was sent to Hawaii and the Panama Canal Zone to plan the defenses of those places. He served on the Mexican border in 1914 as colonel and in 1915 was sent on a mission to China. At the end of 1915 he was promoted to brigadier-general, and to major-general in 1917. In January 1918, shortly after his return from France, he was appointed to the newly-created office of Director of Training, and, later, Commander of the 8th Division. He was awarded the D. S. M. in 1919. His teaching revolutionized American infantry drill regulations; some of his lectures have been collected and published, notably "Seventy Problems: infantry tactics, battalion, brigade and division" (1914); "A study in Troop Leadership" etc. (in collaboration with E. L. Munson: 1911 and 1918); "Training Infantry" (1914).

MORRISON, John Tracy, American lawyer and politician: b. Jefferson County, Pa., 2 Dec. 1860. He was graduated from the University of Wooster, Ohio, in 1887, and from the law department of Cornell University in 1894. In the latter year he moved to Caldwell, Idaho.

where he established a law practice and became active in Republican politics. He served as chairman of the state committee from 1897 to 1900, and was governor of Idaho from 1903 to 1905.

MORRISON, Robert, Scottish missionary, the first Protestant missionary to China: b. Morweth, Northumberland, Jan. 5, 1782; d. Canton, China, Aug. 1, 1834. While working as a last and boot-tree maker, he became interested in theology and studied Latin, Greek, and Hebrew. He attended Hoxton Academy in 1803, and the Missionary Academy, Gosport, in 1804. Ordained in 1807, he was sent to China by the London Missionary Society. In 1809 he was appointed translator to the East India Company's factory in Canton, and in the following year began to print the New Testament in Chinese from a text which he had carefully revised. He completed this work in 1814, and in the same year published his *Chinese Grammar*. With the assistance of Dr. William Milne, he also translated the Old Testament. The work was completed in 1819 and published in 1823. In the following year, on a visit to England, he was elected a fellow of the Royal Society. With his colleagues, Morrison superintended the extensive publication of religious works for diffusion among the Chinese, and in 1818 he founded the Anglo-Chinese College in Malacca. His other published works include *Horae Sinicae* (1812); *A View of China for Philological Purposes* (1817); and the monumental *Dictionary of the Chinese Language*, published in three parts from 1815 to 1823.

MORRISON, William Ralls, American legislator: b. Monroe County, Ill., Sept. 14, 1824?; d. Waterloo, Ill., Sept. 29, 1909. After serving in the Mexican War, he went to the California goldfields. Returning to Illinois in 1851, he attended the preparatory department of McKendree College in Lebanon, and from 1852 to 1854 served as clerk of the circuit court of Monroe County. He was admitted to the bar in 1855, and from 1854 to 1860 was a member of the state legislature, serving as speaker in 1859-1860. At the outbreak of the Civil War, he organized the 49th Illinois Volunteer Infantry Regiment and was elected its colonel. He remained in the army until 1863, when he was wounded at Fort Donelson. Elected to Congress that year, he served until 1865. Re-elected in 1873, he became a strong advocate of tariff reform. Of the several tariffs he introduced, the most celebrated was the so-called Horizontal Bill, defeated by only five votes in 1884. Morrison continued to serve in Congress until 1887, when he became a member of the Interstate Commerce Commission. He remained with the commission for 10 years, serving as chairman after 1892.

MORRISON, city, Illinois, seat of Whiteside County, situated at an altitude of 670 feet, on the Chicago and North Western Railway, 12 miles east of Clinton, Iowa. The center of a dairy farming area, the city has milk-processing plants as well as factories producing refrigerators, stoves, automatic control devices, and furniture. Nearby is Unionville Mill, erected in 1858 and still grinding flour and feed. Morrison was founded in 1853 and incorporated in 1867. In 1874 the inventor James Sargent installed his first time lock on the door of the safe in the First National Bank of Morrison. The city is governed

by a mayor and council and owns its water supply system. Pop. (1950) 3,531.

MORRISTOWN, town, New Jersey, seat of Morris County, situated at an altitude of 405 feet, on both banks of the Whippany River, 17 miles west-northwest of Newark. It is served by the Delaware, Lackawanna and Western and the Morristown & Erie (freight only) railroads and has a municipal airport. Primarily a residential community, it also has considerable trade and ships flowers, fruit, and vegetables grown in the surrounding area. In addition, there are factories producing rubber goods, clothing, electrical products, pharmaceuticals, paving materials, and umbrellas.

The chief point of interest is Morristown National Historical Park, established in 1933, which covers 958.4 acres partly within and partly outside the town. The park consists of three units: Ford House, Fort Nonsense, and Jockey Hollow. Ford House, which served as George Washington's headquarters in 1779-1780, is stored with Washingtoniana and has been a museum since 1873. It was built by Col. Jacob Ford, Jr., Revolutionary War powdermaker, in 1774. Behind the mansion is a historical museum established in 1938. The earthworks at Fort Nonsense, originally built at Washington's order in 1777, have been reconstructed. In Jockey Hollow are recreations of camp buildings used by the Continental Army in 1779-1780 and 1780-1781 and the Wick House (1746). The Jabez Campfield House (1760) was the scene of Alexander Hamilton's courtship of Elizabeth Schuyler. Other notable buildings include the county courthouse, erected in 1826, and the municipal building (1918), originally the home of Theodore N. Vail (q.v.). Near the town is the Seeing Eye, the famous institution for training dogs to lead the blind.

The site of Morristown was settled in 1709-1710 as West Hanover. In 1739 the name was changed to Morristown in honor of Lewis Morris (q.v.), first governor of New Jersey. During the American Revolution the town supplied iron to the Continental Army. From January to May 1777, and from December 1779 to June 1780, it was Washington's headquarters. Here also Samuel F. B. Morse and his associate, Alfred Vail (q.v.), developed the magnetic telegraph, in 1837-1838. The town was incorporated in 1865. Government is vested in a mayor and council. Pop. (1950) 17,124.

Consult Sherman, A. M., *Historic Morristown, New Jersey* (Morristown 1905).

MORRISTOWN, city, Tennessee, seat of Hamblen County, situated at an altitude of 1,350 feet, on the Southern Railway, 41 miles east-northeast of Knoxville. It is the shipping center for an area raising tobacco, poultry, and dairy cattle, and has factories producing textiles, hosiery, canned foods, beverages, and furniture. Morristown is the seat of Morristown Normal and Industrial College, a coeducational junior college for Negroes founded in 1881. First settled in 1783, the city was incorporated in 1855. Its water supply system is publicly owned. Pop. (1950) 13,019.

MORRISVILLE, borough, Pennsylvania, situated in Bucks County, at an altitude of 20 feet, on the Delaware River, opposite Trenton, N. J. It is served by the Pennsylvania Rail-

road. The borough's industrial establishments produce chemicals, plastics, and rubber products. Nearby is the Fairless Works of the United States Steel Company, constructed in 1951-1952. Morrisville was named for Robert Morris (q.v.) and incorporated in 1804. Government is by mayor and council, and the water supply system is municipally owned. Pop. (1950) 6,787.

MORRO CASTLE, the name of two fortifications in Cuba. The first is at the east side of the entrance to Havana Harbor; built by the Spaniards in 1589-1597, it was taken by the British under Admiral Sir George Pocock in 1762, and bombarded by United States forces in the Spanish American War. The second, at Santiago de Cuba, was built soon after the first; it was captured by the United States in the Spanish American War.

MORROW, Dwight Whitney, American lawyer, banker, and diplomat: b. Huntington, W. Va., Jan. 11, 1873; d. Englewood, N. J., Oct. 5, 1931. He was educated at Amherst College, where he was a classmate of Calvin Coolidge, and from which he received his B.A. degree in 1895. Upon his graduation from Columbia Law School in 1899, he entered the employ of the law firm of Reed, Simpson, Thacher and Barnum (later Simpson, Thacher and Bartlett), of which he was made a member in 1905. He maintained this connection until 1914, when he joined the banking firm of J. P. Morgan & Co., with which he was associated until 1927. Morrow helped to frame the workmen's compensation law of New Jersey in 1911, and as a member of the New Jersey Prison Inquiry Commission (1917) and chairman of the state board of institutions and agencies (1918-1920) brought about many reforms. In 1918 he served as adviser to the Allied Maritime Transport Council. In 1927, President Coolidge appointed him ambassador to Mexico. He served in this capacity for three years, doing much to improve American-Mexican relations. Among other achievements, he succeeded in settling disputes over oil rights and aided materially in resolving the conflict between the Mexican government and the Roman Catholic Church. In 1930 he was a delegate to the London Naval Conference, and later that year was elected to the United States Senate to fill the unexpired term of Walter E. Edge.

His wife, **ELIZABETH MORROW** (nee **CUTTER**, 1873-), whom he married in 1903, wrote several volumes of prose and poetry and in 1939-1940 served as acting president of Smith College. Their daughter, Anne Spencer Morrow, married Charles A. Lindbergh (q.v.) in 1929.

MORROW, William W., American jurist: b. near Milton, Ind., July 15, 1843; d. San Francisco, Calif., July 24, 1929. He moved to California in 1859, was admitted to the bar in 1869, and engaged in the practice of law in San Francisco. From 1870 to 1874 he served as assistant United States district attorney, and from 1879 to 1882 he was chairman of the Republican state central committee. He was attorney of the state board of harbor commissioners (1880-1883), special attorney for the United States before the French and American Claims Commission (1881-1883), and special United States attorney in connection with the *Alabama* claims (1882-1885). From 1885 to 1891 he was a member of Congress.

Morrow was a member of the federal judiciary for 32 years, serving as judge of the federal court of the northern district of California (1891-1897), and of the circuit court and circuit court of appeals (1897-1923). His decisions, many of them on important constitutional questions, are said to have totaled more than 650. He was also the author of *An Introduction to California Jurisprudence*.

MORS, môrs, or MORSO, môrs'û, island, Denmark, situated in Lim Fjord, Thisted County, in northwestern Jutland. The largest island in the fjord, it has an area of 142 square miles. The shores are marked by precipitous cliffs, and the interior rises to a height of 289 feet. Nykøbing is the chief town. Pop. (1945) 26,988.

MORSE, Edward Sylvester, American zoologist: b. Portland, Me., June 18, 1838; d. Salem, Mass., Dec. 20, 1925. He studied conchology for three years as a special student of Louis Agassiz at the Lawrence Scientific School, Harvard University. After teaching zoology and comparative anatomy at Bowdoin College (1871-1874), he went to Japan and taught at the Imperial University in Tokyo (1877-1880). On this and subsequent visits to the Orient, he added to his knowledge of zoology a remarkable intimacy with Chinese and Japanese art, especially ceramics, and with the folklore and archaeology of both China and Japan. His collection of Japanese pottery was acquired by the Boston Museum of Fine Arts and he served as its curator after 1892. From 1880 until his death he was director of the Peabody Museum in Salem. Besides numerous scientific papers on zoology, ethnology, and archaeology, he was the author of *First Book in Zoology* (1875); *Japanese Homes and Their Surroundings* (1886); *Glimpses of China and Chinese Homes* (1902); *Mars and Its Mystery* (1906); and *Japan Day by Day* (2 vols., 1917).

MORSE, Harmon Northrop, American chemist: b. Cambridge, Vt., Oct. 15, 1848; d. Chebeague Island, Me., Sept. 8, 1920. He was graduated from Amherst College in 1873 and received his doctorate from the University of Göttingen in 1875. He was assistant in chemistry at Amherst (1875-1876), a member of the staff of the chemistry department of Johns Hopkins University (1876-1883), associate professor of chemistry there (1883-1892), professor of analytical chemistry and adjunct director of the laboratory (1892-1908), and professor of inorganic and analytical chemistry and director of the laboratory (1908-1916). He also served for a number of years as research associate of the Carnegie Institution, Washington, D.C. Morse investigated new methods of quantitative analysis, did research on permanganic acid and its salts, and accumulated data on the osmotic pressure of aqueous solutions. In addition to about 60 scientific articles, he published *Exercises in Quantitative Chemistry* (1905); and *The Osmotic Pressure of Aqueous Solutions*, Carnegie Institution Monograph No. 198 (1914).

His brother, **ANSON DANIEL MORSE** (1846-1916), was an educator and historian. He taught at Amherst College from 1876 to 1907 and wrote a number of studies on American political parties.

MORSE, Harry Wheeler, American physicist: b. San Diego, Feb. 25, 1873; d. March 12, 1936. He

graduated (1897) at Leland Stanford Jr. University, and took the degree of Ph.D. (1901) at the University of Leipzig. He was instructor of physics (1902-10), assistant professor (1910-12) at Harvard and professor of chemistry at the University of California (1912-13); engaged in corporation industrial chemistry until 1920 when he became a consulting chemist and metallurgist. He translated Ostwald's 'Letters to a Painter on the Theory and Practice of Painting' (1906) and is joint author of 'Ostwald's and Morse's Elementary Chemistry' (1907), and author of 'Chemistry and Physics of the Lead Accumulator' (1912). Numerous monographs on spectroscopy, fluorescence, diffusion, electrochemistry, etc., are from his pen.

MORSE, Hosea Ballou, American authority on Chinese affairs: b. Brookfield, N. S., 18 July 1855. He was graduated (1874) at Harvard University and was appointed in the same year assistant in the Imperial Chinese Customs service, being promoted (1887) to deputy commissioner and (1896) commissioner. From 1903-07 he was statistical secretary (commissioner of customs) to the inspector-general of customs, retiring 1909. By Imperial decree (1885) he was sent on a special mission connected with the terminating of the Franco-Chinese War, and fulfilled special duties (1885-87) connected with the reorganization of the subsidized China Merchants' Steam Navigation Company. In 1889 he was appointed special commissioner to arrange for opening Hunan Province to foreign trade. For his numerous services he has received (by Imperial rescript) The Decoration of the Double Dragon, III division, 2d class (1885); Double Dragon 1st class (1903); Order of Chia Ho, 3d class, Republic of China (1916). He has written 'The Currency of China' (1906); 'Trade and Administration of the Chinese Empire' (1908, new ed. 1920); 'International Relations of the Chinese Empire' (1910-18); 'Chronicles of the East India Company in China, 1635-1834' (1925).

MORSE, Jedidiah, American Congregationalist clergyman and geographer: b. Woodstock, Conn., 23 Aug. 1761; d. New Haven, 9 June 1826. He was graduated from Yale in 1783; studied theology under Jonathan Edwards; was pastor at Charlestown, Mass., from 1789 to 1820; and spent his last years in New Haven. He was intensely orthodox; established in 1805 the *Panoplist*, a religious journal combating Universalist views; and was an able and successful teacher. He wrote 'A Compendious History of New England,' with Elijah Harris (1804); 'Annals of the American Revolution' (1824), and a series of excellent biographies.

MORSE, John Torrey, American historian: b. Boston, 9 Jan. 1840. He was graduated at Harvard in 1860, and was lecturer on history there from 1876 to 1879. For two years he was associated with Henry Cabot Lodge in the editorship of the *International Review*. Served on board of overseers of Harvard University for 11 years and was member of the Massachusetts legislature in 1875. He also studied and practised law in Boston for a time and wrote treatise on 'Law of Banks and Banking' which has now reached seventh edition; also 'Law of Arbitration and Award.' His literary work was chiefly in historical biography, and he edited the 'American Statesmen' series,

which is ranked among the best biographical works for the interpretation of American history. For this series he wrote 'Abraham Lincoln' (1893); 'Benjamin Franklin' (1889); 'John Adams' (1884); 'John Quincy Adams' (1883); and 'Thomas Jefferson' (1883); his other works include 'Life of Alexander Hamilton' (1876); and 'Life and Letters of Oliver Wendell Holmes' (1896); also 'Life and Letters of Colonel Henry Lee' (1905). D. 27 March 1937.

MORSE, Richard Cary, American clergyman: b. Hudson, N. Y., 19 Sept. 1841. He was graduated (1862) at Yale and took (1865) the degree of A.M., when he studied theology at Princeton and Union Theological seminaries (1867). From 1867-69 he was assistant editor of the *New York Observer* and was ordained (1869) to the Presbyterian ministry. He was general secretary of the international committee Y. M. C. A. (1869-1915), continuing as consulting general secretary. His work was connected with the supervision and extension of the Y. M. C. A., especially in North America; but his labors have taken him on tours to India, Australia, China, Korea, Japan, the Philippines and Russia. He wrote 'Robert R. McBurney, a Memorial' (1899); 'Polity of Young Men's Christian Associations' (1904); 'Fifty Years of Federation of the Y. M. C. A.' (1905); 'History of the North American Y. M. C. A.' (1913). He died 25 Dec. 1926.

MORSE, Samuel Finley Breese, American inventor and artist: b. Charlestown, Mass., 27 April 1791; d. 2 April 1872. He was the eldest son of the Rev. Jedidiah Morse (q.v.). After graduating at Yale in 1810, he visited England with Washington Allston (q.v.) to study painting. In 1813 his first attempt at sculpture, a 'Dying Hercules,' won for him the gold medal of the Adelphi Society, and he received the same from the hands of the Duke of York. He returned to New York in 1815, and in 1824-25 organized an association which became the present National Academy of Design. He was its first president and continued in office for 16 years. He again spent three years in study in Europe, and then returned to New York to take the professorship in the University of the City of New York.

Morse had always been fond of the study of chemistry and natural philosophy, and it became at last a dominant pursuit with him. In consequence of his intimacy with Prof. J. Freeman Dana, who was lecturing in the same institution on the electro-magnet, Morse became interested in electrical matters, and in 1832, while returning home from Havre on the packet ship *Sully*, he first conceived the idea of the telegraph. But though thus early devised, yet circumstances prevented the complete construction of the first recording apparatus in New York until 1835, when he exhibited it at the New York University building. In 1837 he made another and more perfect exhibition, and filed his caveat at Washington. He now considered his apparatus sufficiently perfected for commercial introduction, and in 1838 he asked Congress to construct an experimental line from Washington to Baltimore to show its practicability. From the skepticism of many and the ridicule of others, Morse's request was not acted upon by Congress, and, disappointed and almost disheartened, he repaired to England in hopes of

getting some foreign government to aid him. The result of this visit was a refusal to grant him letters patent in England, and the obtaining of a useless *brevet d'invention* in France. For four years he struggled and put up with many privations, and, as if it were designed to try him up to the last moment, no recognition of the matter was taken till the last night of the Congressional session. He retired to bed disheartened and discouraged before the session was closed. But in the morning—the morning of 4 March 1843—he was startled with the announcement that the desired aid of Congress had been obtained in the midnight hour of the expiring session, and \$30,000 placed at his disposal for his experiment between Washington and Baltimore. In 1844 the work was completed, and demonstrated to the world the practicability and the utility of the Morse system of the electro-magnetic telegraph. The first message, "What hath God wrought?" was sent from the United States Supreme Court room in the Capitol at Washington to Baltimore, 24 May 1844. From that day the telegraph was a success.

Honors were showered upon him by European sovereigns and governments. Probably no American has ever received so many marks of distinction. In 1848 Yale College conferred on him the complimentary degree of LL.D., and in the same year he received the decoration of the Nishan İftihar in diamonds from the sultan of Turkey. Gold medals of scientific merit were awarded him by the king of Prussia (set in a massive gold snuff box), the king of Württemberg, and the emperor of Austria. From the emperor of the French he received in 1856 the cross of chevalier of the legion of honor; in 1857 from the king of Denmark the cross of knight of the Dannebrog; and in 1858 from the queen of Spain the cross of knight commander of the Order of Isabella the Catholic. The sum of 200,000 francs was presented to him jointly by the principal governments of Europe. It has been said that much of this money was spent in the ceaseless litigation and lawsuits in which he was involved in the defense of his patent rights.

Professor Morse also had the distinction of laying the first submarine telegraph line, which was done in New York harbor in 1842. He likewise set up the first daguerreotype apparatus and was associated with John W. Draper in taking the first daguerreotypes in America. A letter from Professor Morse to the Secretary of the Treasury in 1843 seems to contain the earliest suggestion of the possibilities of an Atlantic cable. His last public act was the unveiling of the statue of Benjamin Franklin, in Printing House Square, New York. Consult Prime, 'Life of S. F. B. Morse' (New York 1875) and Morse, E. L. (son), 'Samuel Finley Breese Morse, his Letters and Journals' (2 vols., Boston 1914).

MORSE, Sidney Edwards, American journalist and inventor, son of Jedidiah Morse (q.v.) and brother of S. F. B. Morse (q.v.): b. Charlestown, Mass., 7 Feb. 1794; d. New York, 24 Dec. 1871. He was graduated at Yale in 1811; studied law; established the *Boston Recorder* in 1815 and the *New York Observer* in 1823, the pioneers of American religious journalism; invented a flexible piston-pump in

1817 and the cerographic method of printing maps in 1839; improved a bathymetre for deep-sea soundings; and, like his father, was an able and successful geographer. His 'New System of Modern Geography' ran to half a million copies.

MORSE, Sidney H., American sculptor and editor: b. Rochester, N. Y., October 1832, d. San Mateo, Fla., 18 Feb. 1903. In youth he worked at marble-cutting and acquired a taste for sculpture. Later he studied at Antioch College and afterward began to preach in Unitarian pulpits in the West; still later made further preparation for the ministry at Harvard, and for some time was settled in Haverhill, Mass. From 1865 to 1872 he was editor of the *Radical*, a worthy successor of the famous *Dial*. Morse counted among his friends, and contributors Emerson, A. B. Alcott, Samuel Johnson, Samuel Longfellow and many others prominent in literature and reform. When he discontinued the *Radical* he turned with enthusiasm to sculpture and produced many notable works. He made a bust of Emerson, which is in the Second Church, Boston, the present edifice of the society to which Emerson ministered (1829-32), and another of the same subject, regarded by Emerson's friends as the best extant. His other subjects include Channing, Parker, James Martineau, Walt Whitman, Carlyle, Thomas Paine, Lincoln, Holmes and President Cleveland. Morse wrote much for periodicals and attained fame as a lecturer. One of his poems, 'Sundered,' is to be found in Emerson's 'Parnassus.'

MORSHANSK, môr-shānsk', Russia, a district town in the province of Penza, on the navigable river Tsna and on the Syfran-Vyasma Railway. It has a gymnasium for girls, a city bank and factories producing tobacco, soap, tallow, spirits, etc., besides doing a lively trade in grain. Its population is about 28,000.

MORSÖE, mör's-ë-ë. See MORS.

MORTALITY, a term applied to that branch of investigation which determines the proportion of the number of persons who die in any assigned period of life or interval of age, out of a given number who enter upon the same interval, and consequently the proportion of those who survive. Tables showing how many out of a certain number of infants, or persons of a given age, will die successively in each year till the whole become extinct, are generally called tables of mortality. There is no fixed number of lives upon which such tables are based, but the observation of a large number is indispensable to accuracy, and the larger the number that can be duly observed the greater will be the degree of accuracy attained. It must always be borne in mind, however, that a strict observation of a moderate number will yield truer results than a looser induction from a larger number. The basis of such calculations must be an accurate register of the number of births and deaths, and in the case of the latter, at what ages, in a given district or extent of country.

In Great Britain the bills of mortality, or abstracts from parish registers, were long the only means of arriving at these results; but being found very imperfect and unsatisfactory, they were supplanted in 1836 by a general regis-

ration. The results furnished by such tables are very various and of great interest. The registers, if kept with sufficient accuracy and completeness, enable us to determine the proportion of deaths, not only at different ages and in different regions, but at different seasons, for persons of different occupations and habits, in towns or the country; and thus afford valuable materials for the science of political economy. Although much more attention has been paid to this subject in recent times, yet the observations have not been so extensive nor so accurate as is desirable.

Although the collection of regular statistics of mortality is of recent origin, the subject has always excited much interest, and many general facts have been collected regarding it. The tendency of mortality to diminish with the progress of civilization has been satisfactorily established by statistics. The average rate of mortality is affected by regular or constant causes, such as race, climate, age, sex, profession, social position, density of population, political institutions, habits, etc., and by such regular or occasional causes as war, famine, pestilence, etc., but notwithstanding the interruption of these occasional causes a constant tendency to a mean has been found to exist in any given state of society. The fact that the tendency of population to increase or diminish is quite independent of the rate of mortality was first established by Malthus, who showed that the increase of population depended on the facility of procuring the means of subsistence and not on the duration of life. The mortality in the United States, for example, is greater than in England, yet the population of the United States doubled itself in 25 years and that of England in 43 years, while in various European countries which have a lower mortality than the United States, the population did not double in a century.

Some statisticians have attached considerable importance to the effects of race on population. It is extremely difficult, however, to establish anything in regard to race independently of circumstances and social habits. It has been shown, for example, that the average mortality among the Jews in Prussia is less than among the Christians, that the mortality varies greatly among the various races who inhabit the Austrian Empire, being least among the Germans, and that a similar difference prevails in the departments peopled by various races in France, and that all such evidence is open to the most obvious exceptions. The influence of climate on mortality is inseparably associated with that of migration. It cannot be established that any climate, except perhaps the extremes of heat or cold, moisture or dryness, is in itself exceptionally favorable or unfavorable to human life, but change of climate is frequently adverse to it.

The most remarkable fact in respect to age is the great mortality which commonly takes place among children under five years of age. This is especially remarkable in large towns, and is not wholly confined to them. Although the diseases to which infancy is liable may naturally account for part of this excessive mortality, the greater part of it must be attributed to ignorance and want of due care in the training of children, partly arising from the unfavorable circumstances in which, through the too rapid increase of population, they are

brought into the world. This is both directly and indirectly a considerable cause of the extra mortality of large towns and other dense centres of population. The question whether city or country life is most conducive to a low rate of mortality is still undecided. Direct statistics prove nothing, as the death rate of towns is raised by immigration from the country and other causes. In regard to sex it is established that women live longer than men, and that among men the married live longer than the single. The condition of life in respect to poverty or wealth is known to have a considerable influence on mortality. Dividing France into two classes, rich and poor, the annual mortality was found to be 1 in 46 in the former and 1 in 33 in the latter. This gave to the rich an average duration of life of 57 and to the poor one of 37 years. See *LONGEVITY*; *VITAL STATISTICS*.

MORTAR, a calcareous cement used in building. It differs in its characteristics according to the nature, proportions or treatment of its constituents. The proportions vary from one and one-half to four or five of sand to one of lime. Hydraulic mortar is made from certain limestones which include in their composition so large a proportion of iron and clay as to enable them to form cements which have the property of hardening under water and are called hydraulic limestones. The proportions of clay vary in different quarries, and often in the same from 8 to 25 per cent. See *CEMENT*; *LIME*.

MORTAR, or **MORTER**, a vessel usually of metal but frequently of other suitable material, used by pharmacists and others in preparing powders and other medicines. Also a piece of ordnance. See *ORDNANCE*.

MORTAR, utensil employed by the Indians of America and other indigenous races for the grinding or mashing of grains and other substances used as food or for other ends. The Indian mortar naturally had a different name in each tribe, and some of these names were familiar to the whites. A survival of these Indian mortar names is the metate of Mexico (q.v.) derived from the Aztec word *metatl*. The mortar has many forms ranging from a flat stone to a deep receptacle of stone, bone or wood in which the grain or other substance is reduced by pounding or grinding to a floury or plastic state. Throughout the area occupied by the Pueblo Indians in the United States, and in Mexico, Central America and the greater part of South America, and especially in Colombia, Venezuela and the Pacific Coast countries the grinding of grain, seeds, nuts, roots and other substances is done on a flat stone, generally rectangular in form. For the most part the grinding is performed by means of a stone muller more or less cylindrical in shape, which is rarely used as a roller, the substances being crushed between the metate and the muller by pressure and rubbing. This was the process used throughout the great corn belt stretch from Arizona to southern Chile at the time of the discovery of America; and throughout this vast region it is the process generally in use to-day, more especially among the Indians and mestizos for reducing corn and other substances to a condition for cooking.

Forms of Mortars.—Throughout other parts of North America there were many forms of mortars distinctly different from those in use in the region already indicated, but closely related to one another in shape. Among the Iroquois and other northern and eastern tribes of the United States and parts of Canada the natives made use of wooden mortars hollowed into the top of a block cut from the trunk of a tree. In this hollow, which was of considerable size and depth, the corn or other substance was put, in a dry or wet condition, and pounded into a more or less fine powder or into a soft, semi-liquid mass, by means of a long wooden pestle, with a pounding surface at both ends. The remains of very primitive mortars in many parts of the American continents show the various processes through which the modern mortars have passed to reach their present perfection. Originally a rough unworked flat stone was used as a grinding surface and an unshaped rounded stone served to do the pounding. From this primitive utensil to the carefully shaped metate of the Mexican or the handsomely carved and hollowed mortar of the Alaskan and British Columbian tribes is a long step which bridges a lengthy period of cultural development. In the granite rock of California mortars in the shape of excavations are frequently found on the sites of old Indian villages. Some of these are very primitive in form, while others, evidently of a much later development, are carefully shaped and seem to follow a regular plan of structure. It is probable that the flat stone metate form and the hollow mortar form both originated in pounding grain on a flat surface, the two natural methods of preventing the loss of the pulverized grain being to reduce the pounding to rubbing or rolling, and to pound the grain, in a deepish hole, as was done in the California granite rock. The tribes of the great forest area of the North, having no hollow rock beds or stones easily worked, hollowed out the ends sections of tree trunks or sides of logs by means of fire which also hardened the inner surface of the mortars, dried the wood and made them very durable. In regions where stone and wood were not available, bone, rawhide and other materials were converted into mortars for the grinding of food materials. In the whale country some of the races addicted to whale hunting used the vertebræ of that animal for mortars. Some of these are still employed. In the Eastern States of the United States primitive mortars made of hollowed but otherwise unshaped boulders are frequently encountered; and similar mortars are formed in California, side by side with other globular mortars, which are evidently but a more artistic development of the boulder form. A further evolution of the artistic form was reached when stones were quarried from the rocky bed, shaped to exact pre-determined form and proportions and frequently decorated with conventional forms, mystic signs or figures of household gods.

The pestle took upon itself as many shapes and designs as the mortar, and like relation of the latter to the metate, it was first cousin to the muller, both of which had their origin in the rough, unworked stone used by primitive man to pound or crush his food, and other objects. Some pestles were heavy and several

feet long; others were short instruments which could be used with one hand. Metates and mortars were of many shapes, sizes and designs, and their uses were almost as varied as their forms.

Uses of Mortars.—Indians, throughout the buffalo country, put the buffalo meat into a rawhide bag which they placed in a hole in the earth with the open mouth upward. While here they pounded the meat into shape for pemmican. Some Indians placed their shallow mortars in closely-woven baskets considerably larger than the mortars so that the grain that fell from the latter, in the process of grinding or pulverizing, might be saved. Others of the Pueblo Indians placed a basket-shaped hopper in the mouth of the mortar to prevent the pounded grain from hopping out. It is probable that very large "mortar holes" found in rock were also used as boiling pots, in which the heated water was obtained by dropping superheated stones into the hole. The large wooden portable mortars of the forest-region Indians were generally set on the ground so as to make them firm and steady. The ordinary metate of Mexico and Central America has generally three legs upon which it stands steadily. In many cases these give it an artistic appearance. Most of the metates are made of lava rock, especially in the districts where lava is plentiful. Metates are made of rocks of different grades of coarseness. Thus it is possible, by passing ground grain from one metate to another, to finally obtain a flour as fine as the finest turned out by the best modern mill machinery. Fine metates and mortars are also made from granite, limestone, sandstone and other rocky material. Perhaps the most artistic development of the mortar is to be found among the Haida Indians of Alaska, who probably learned their art from Asiatic tribes. Not only are mortars of a great variety of forms and designs but they are also of many sizes, ranging from tiny little vessels to huge excavations. The reason is that they were put to a variety of uses. The smaller mortars were employed as receptacles in which to grind paints, medicines, shells, tobacco and other substances used in medicine, personal decoration, ceremonies, incantations and dances. All the grinding of corn and other food products was almost universally done among the American Indians by women; but in the case of the ceremonial substances, especially those considered of a sacred nature, where the efficacy of the charm, ceremonial use or medicine depended upon the manner in which the grinding was done, this work was generally left to the medicine men, who were learned in all the ceremonial forms and traditions of the tribe.

MORTARA, môr-tä'rá, Edgar, Jewish boy whose forcible removal from his parents by the orders of the archbishop of Bologna in 1858 aroused great excitement in Europe and led to protests from several powers, but the Pope

declined to interfere. The plea made in justification of the act was that Mortara had been early baptized into Christianity by a Roman Catholic maid-servant. The Roman Catholic authorities, however, declined to return him; and despite the many protests in the matter, he remained, of his own choice in 1870, with the Church and entered the Augustinian order. Consult 'The Truc Story of the Jewish Boy, Edgar Mortara' (1860), and Vollet, 'Edgar Mortara' (1881).

MORTARA, môr-tă'ra, Italy, capital of the province of Pavia, on the Arbogna, also chief town of the Lomellina, and junction of the Novara-Mortara-Alessandria, the Mortara-Milano and the Vercelli-Mortara-Pavia and the Mortara-Casale railways. It has a Gothic church (San Lorenzo) and the Santa Croce convent church, also a theatre, gymnasium and technical school. It has manufactures of machinery and hats and does considerable trade in its rice and cheese products. The Austrians under Duke Albrecht won a battle here against the Piedmontese in 1849. It had a population of 8,770 for the entire commune.

MORTE D'ARTHUR. This great English collection of Arthurian romances, written between 1470 by Sir Thomas Malory, as one of the cardinal books whose influence has reached beyond any mere personal fame. Personally, indeed, Malory has remained almost unknown. Even the probability that this 15th century gentleman and soldier served with Richard, Earl of Warwick, pattern of chivalry, was recovered only 25 years ago; but 400 years have proved the vitality of his book. After inspiring the conduct of noble English youth for generations, it was reinterpreted in Tennyson's most popular poem, 'The Idylls of the King'; and, surviving so unusual a competition, it is still reprinted, read and loved. Yet as a translation, in great part from known French sources, it is not in our modern sense original. Therefore the reasons for its fame are the more significant as going to the roots of permanent literary interest. The first reason, of course, is style. Writing in the early days of English prose, Malory has the dignity and ease of such early historians as Froissart; but his even and leisurely pace does not preclude the force of direct diction. This rare combination of dignity with simplicity has been sufficient to preserve his work without any great strength of structure, any compelling movement of the whole. The 'Morte d'Arthur' is not composed as a whole, not planned to lead us on stage by stage to a culmination. True, the closing books are felt as the tragic conclusion of Arthur's chivalry in a world of violence; but with many of the preceding stories it has no specific connection. Rather Malory worked as the mediæval romancers from whom he drew had worked before him. Collecting all the well-known stories — and a few less well known — that had come to be associated with the great name of Arthur, he used them much as he found them; and he told each for itself. Though he sometimes suggests complication of plot or development of character, he never worked for these in the ways of the modern novelist. The Renaissance had but touched England; and its literary ideas, even if they had been prevalent, would hardly have moved so thorough a mediævalist as

Malory. He turned away from the actual wars of the Roses to the legendary wars of Arthur's knights because of his intense sympathy with the ideals of a passing chivalry. He is far more mediæval than Chaucer. Though in style he has his own distinction, in composition he is the typical mediæval transmitter.

Every one of the stories that he thus brought together has a long history. Many of them reach far back into folklore. Most of them before they came to him had been told over and over again. The successive versions, their relations, their combination, the transference of a tale from Gawain to Percival and then to Galahad, the building up of a cycle of Grail stories and the attaching of this to the Arthurian cycle — all these have claimed much scholarly investigation and still offer problems as difficult as they are significant. But of this Malory was no more aware than the thousands of readers who have gone to him, not for history or folklore, nor for psychology or drama, but for the solace and inspiration of high adventure.

Beginning with the perennial story of the prince wondrously born and sent in the nick of time to claim the crown, right wrong, and establish a kingdom of justice, courtesy, and honor, he ends with the traditional hope that the same king, though in his stricken age borne away to the Isle of Avilon, may yet return to reign. Only to the latter books belongs properly the title 'Morte d'Arthur,' which is borne also by several mediæval poems. Between the young prince smiting the stone with his miraculous sword and the old king fighting his last battle against treason in the dim West, what a store of quests and deliverances, what a goodly array. Balen and Balan still show a primitive wildness in spite of the faint hint of the coming Grail; and the fairies, though crowded to the back of the stage by the stir of chivalry, still peep from their Celtic twilight. Morgan le Fay is dangerous in revenge. The Lady of the Lake gives the magic sword, and to her at the last it returns. Merlin the wizard, after all his triumphs of wisdom and skill, "was assotted and doted on one of the ladies of the lake." But these are only old echoes. The stories are of chivalry; of Beaumains, youth proving its unconquerable force; of Tristram and Iseult, the immortal lovers, and Guenever, the queen mistress who drew the peerless Lancelot across steel and fire and even across loyalty; of Gawain, his earlier fame tarnished, but still the courteous; of a hundred good knights who sought wild paths and frightful risks and stiff battles because they must make life an adventure.

Following these old adventures with adventurous hearts, readers have always been glad that they are numerous, and have not missed in the thronging of Malory's stories that unity which he did not seek. From the conquest of Rome to the earliest adventures of Lancelot, from Beaumains to Tristram, Malory goes leisurely, but always with zest; and by the way he pauses for yet other stories. The 'Morte d'Arthur' is a storehouse of romance. And above all the other quests, above the errant fighting throng, shines the supreme quest of the Holy Grail, the great romance of the Mass. Malory's aim, then, was not that modern literary distinction which comes from

originality of composition; it was to make men love the high things that he loved. His work was to him the handing on of the great traditions of chivalry. Caxton, who printed it in 1485, well calls it a "noble and joyous book."

CHARLES SEARE BALDWIN.

MORTEN-MULLER, mör'tén-mül'lër, Norwegian painter: b. Holmestrand, Christianiafiord, 29 Feb. 1828; d. 1911. He began to study art in Düsseldorf (1847) first under Tide-
mand and Eude, and later as a pupil in the academy under J. W. Schirmer. He removed to Stockholm in 1850, but in 1866 opened an art school in Christiania under government patronage. He returned to Düsseldorf in 1871 and devoted himself to setting forth the wild scenery of his native country in a series of vast canvases. Fiord, valley and mountain height are represented with fine imaginative yet truthful line and color. The most noteworthy of his landscapes are 'Norwegian Landscape' and 'Entrance to Hardangerfiord' (both in the National Gallery of Christiania); 'A Fir Forest' (in the Gallery at Hamburg); 'Romsdalfiord,' with historical figures put in by Tide-
mand (1876); 'Start of the Fishing-boats by Night'; 'Waterfall and Pine Forest' (1879); 'Fisherman's Cot in Christianiafiord' (1880); 'Woodland Lake by Moonlight' (1892). His works combine romantic picturesqueness with color power of startling realism. In 1874 he was appointed court painter and member of the Stockholm Academy.

MORTGAGE, mör'gāj ("dead pledge"), *in law*, the conveyance of property, movable or immovable, as security for the payment of a debt on the condition that if the debt be duly paid the conveyance shall be void. The term is applied: (1) To the act of making such a conveyance; (2) to the deed by which such conveyance is made; (3) to the rights thereby conferred on the mortgagee. He who makes the mortgage is the mortgagor; he for whose benefit it is made is the mortgagee. Whatever may be sold may be mortgaged. Mortgages may therefore cover chattels or real estate. Mortgages must be in writing, either in one single instrument containing the whole case or in two, one containing the conveyance, the other the condition of the conveyance, this last document being the "defeasance." A deposit of titledeeds, with a verbal agreement, creates an equitable mortgage in some States which recognize this proceeding as a mode of securing a debt. The different States regulate the time in which mortgages are to be recorded, in order to protect innocent purchasers, but an unrecorded mortgage is good as against the mortgagor or any purchaser knowing of its existence at the time of his purchase. The tendency of courts now is to regard a mortgage as a lien rather than a conveyance of the land, and it is now generally regarded as a mere security for the payment of a debt.

Important changes in the law of mortgages were made by a new British act, effective 1 Jan. 1926. See also FORECLOSURE.

MORTGAGE BANKS. See BANKS AND BANKING—WORLD'S SYSTEM.

MORTGAGE GUARANTY INSURANCE. See GUARANTY INSURANCE.

MORTIER, mör'tyā', Edouard Adolphe Casimir Joseph, Duke of Treviso, French

marshal: b. Cateau-Cambrésis, 13 Feb. 1768; d. Paris, 28 July 1835. He entered the army in 1791, fought in the campaigns of 1792 to 1795, was brigadier-general in 1798 on the fields of South Germany and Switzerland, and besieged (1803) Hanover, being raised (1805) to rank of marshal. In the war with Prussia he commanded the army against the Swedes and was victorious at Anklam (1807), whereupon he agreed to an armistice at Schlattkow (18 April). He commanded the left wing of the army in the battle of Friedland and was created Duke of Treviso (1808), to be given in that year command in Spain, where he won the battle of Ocaña (1809). He commanded the young Guards in the Russian campaign and also in 1813. In 1814 he, together with Marshal Marmont, defended Paris, but submitted to Louis XVIII and was made a peer of France. By March 1815 he had again joined the forces of Napoleon, thereby losing his title of peer, on the latter's defeat and the second Restoration. He was elected (1816) member of the Chamber of Deputies and retained the place till the end of 1818. In 1819 the dignity of the peerage was restored to him, being made hereditary in 1824. He was made chief chancellor of the Legion of Honor (1834) and became Minister of War and president of the council in the same year. He was killed (1835) by the infernal machine of Fieschi at the king's side as he was passing along the Boulevard du Temple, Paris. Monuments have been erected in his memory in his native city and also Lille.

MORTIFICATION. See GANGRENE.

MORTIMER, mör'ti-mër, John Hamilton, English artist: b. Eastbourne, Sussex, 1741; d. 1779. After studying under Sir Joshua Reynolds, he carried off the first prize of the Society of Arts, London (1763). He was elected R.A. in 1779. A bold and vigorous draughtsman and a good colorist, he was fond of dramatic scenes in which there was an element of the terrible. His style and manner are well exemplified in the pictures 'Battle of Agincourt'; 'Völtigern and Rowena'; 'Hercules Slaying the Hydra'; now in the South Kensington Museum. He was very successful as an etcher, and designed stained glass for Salisbury Cathedral and Brasenose College, Oxford.

MORTIMER, Roger, 8th Baron of Wigmore and 1st Earl of March, English noble: b. about 1287; d. Smithfield, 29 Nov. 1330. He had been convicted of treason in the reign of Edward II and pardoned; but notwithstanding the king's clemency took part in the rebellion of the Earl of Lancaster, and was made prisoner in 1322. Having escaped from the Tower, where he was confined, he went to France and at Paris in 1325 met Queen Isabella, who had been sent thither by Edward to negotiate a treaty. Fascinated by his pleasing address, the queen was soon known to be living in guilty intimacy with the exile, and, having secured the person of her young son, began to mature plans with Mortimer and the other leaders of the barons for getting possession of the kingdom. Mortimer went with her to England in 1326 the king was deposed and his son Edward II. proclaimed in his stead, and for some years Isabella and her paramour governed the realm in the name of the young prince. Mortimer popularly regarded as responsible for the

death of the dethroned monarch in his prison (1327). The failure of the Scottish expedition in 1327, and the "shameful peace" with Scotland in the following year, had wounded the pride of the English people. The nobles wearied of his arrogance and Edward resolved to take the sceptre into his own hands. While the queen and Mortimer were in Nottingham castle during the session of Parliament at that town, the king and Lord Montacute with attendants entered by night through a subterranean passage and carried off the earl. The king summoned a new Parliament to meet him at Westminster, and on 26 November Mortimer was condemned by this Parliament and executed three days later.

MORTMAIN, *môrt'mân*, in English law, lands held by a corporation were said to be held in mortmain (*mortua manu*, by dead hand), because they were then not alienable. The expression has particular reference to estates held by religious and eleemosynary corporations in England. At one time half the land in England was vested in religious houses. As early as 1279 the English Parliament began to deal with the evils arising from the transfer of lands to religious corporations; the lords of the soil were deprived of escheats or other feudal profits: "a dead hand yieldeth no service." In 1736 by the Mortmain Act the power of devising land by will to charitable purposes was destroyed. The law on this subject was consolidated by the Mortmain and Charitable Uses Act (1888), under which no bequest for a charitable purpose was to involve the acquisition of land. The Act of 1891 enacted that land may be devoted to any charitable use, but it must be sold within a year from the testator's death, unless the time be extended by certain authorities. It also permits the acquirement of land directed to be acquired for a charity if the court or the charity commissioners consent. A large number of acts from 1841 onward have exempted from mortmain restrictions land bequeathed for school sites, burial-places, places of worship, literary and scientific institutions, public parks, but maximum limits are imposed in several cases.

The old English statutes of mortmain have not been regarded as in force in the United States except in Pennsylvania, where the dedication of property to superstitious uses, and grants to a corporation without statutory license, are forbidden. In some States the right of religious corporations to hold land, and the power to make, devise or bequeath land to religious societies or charitable purposes, is restricted.

MORTON, Charles, English-American Puritan divine: b. Pendavy, Cornwall, 1627; d. 1698. He studied at Wadham College, Oxford, was appointed (1655) rector of Blisland, but his puritanic tendencies caused his ejection in 1662. He was made master of the dissenters' school at Stoke Newington, London (1685), where Daniel Defoe was numbered among his pupils. Prosecutions by the ecclesiastical courts caused him to migrate (1686) to New England and he became minister of the first church at Charlestown, Mass. He was prosecuted for a seditious sermon (1687) but acquitted. He got into close connection with Harvard and was given (1692) the management

of the inward affairs of the college with the title of vice-president. His succession to the college's president, Increase Mather, seemed likely but for his death. He approved the prosecutions for witchcraft at Salem. Consult Quincy, Josiah, 'History of Harvard University' (Cambridge, Mass., 1840).

MORTON, or **MOURT**, **George**, Puritan colonist: b. York, England, about 1585; d. 1628 (?). He affiliated himself with the Puritans in 1600 and settled in Holland, but was for some years previous to 1620 London agent for the Puritans. Authorities disagree as to his career, some placing his emigration to America in 1620 while others fix it at 1623, and the same uncertainty prevails as to his death, the dates varying from 1624 to 1628; there is no conclusive evidence as to whether it occurred in England or America. For many years he was credited with the authorship of Mourt's 'Relation or Journall of the beginning and proceedings of the English Plantation at Plimoth,' published in London in 1622. Careful investigation, however, seems to prove conclusively that the authorship must be credited to Winslow and Bradford, and that at most only a small portion of it can be claimed by Morton. The work, which is regarded as the most authentic history of the times in existence, has been several times reprinted. Consult 'Mourt's Relation,' with introduction and notes by Henry Martyn Dexter.

MORTON, Henry, American scientist: b. New York, 11 Dec. 1836; d. there, 9 May 1902. He was graduated from the University of Pennsylvania in 1857 and became professor of physics and chemistry at the Episcopal Academy of Philadelphia in 1860. His lectures in 1863 at the Franklin Institute in Philadelphia attracted attention throughout the United States and Europe by reason of his brilliant and unique experiments. He was one of the founders of the Philadelphia Dental College in 1863 and its first professor of chemistry, and in 1864-70 was resident secretary at Franklin Institute, where he continued his lectures. In 1867 he was appointed professor of chemistry at the University of Pennsylvania, and in the same year became editor of the Franklin Institute *Journal*. He conducted the photographic branch of the United States eclipse expedition to Iowa in 1869, and in addition to securing several excellent photographs of the eclipse, proved that the bright line of the sun's disc adjacent to the moon is due to a chemical action in the process of developing the plate and not to diffraction as had hitherto been held by the best scientists. In 1870 he was chosen president of the newly-founded Stevens Institute of Technology, and under his direction the faculty was selected and the course of instruction formed. His management of the institute made it one of the leading technological schools of the country; he gave it the benefit not only of his great learning but also several munificent gifts in the establishment and endowment of various necessary departments. His reputation as a scientist became world-wide and his services as a chemical expert were eagerly sought in litigation. From 1878-85 he was a member of the United States Lighthouse Board and in 1876-81 he was president of the American Chemical Society. Besides writing numerous

papers on electricity and fluorescence, he assisted in the preparation of 'The Student's Practical Chemistry' (1868).

MORTON, James Douglas, 4th earl of, regent of Scotland: b. Dalkeith, Scotland, about 1530; d. Edinburgh, 3 June 1581. He married a daughter of the third earl and succeeded to the earldom on the death of his father-in-law, in 1553. He became Lord High-Chancellor of Scotland 10 years later, but fled to England in 1556 on account of his share in the murder of Rizzio. He was soon pardoned and on Bothwell's abduction of Queen Mary joined the confederated lords against him. He stood sponsor for James VI at his coronation, and led the van at the battle of Langside (1568). He again became one of the leading opponents of Bothwell; was chancellor, and in 1572 regent of the kingdom. Having made himself many enemies by maladministration, he resigned, but recovered authority not long after. His enemies, however, at length proving too strong for him, he was charged as accessory to the murder of Darnley, tried, condemned and beheaded by the decapitating instrument he himself had introduced into Scotland.

MORTON, James St. Clair, American soldier: b. Philadelphia, Pa., 24 Sept. 1829; d. Petersburg, Va., 17 June 1864. He was graduated from West Point in 1851, was appointed to the engineering corps and in 1855-57 was assistant professor of engineering there. He was in charge of the Chiriqui expedition in Central America in 1860, and later superintended the work on the Washington aqueduct. In 1861 he was in command of the fortification at Tortugas, and in May 1862 was appointed chief engineer of the Army of the Ohio. In October 1862 he was promoted brigadier-general and was transferred to the Army of the Cumberland as chief engineer in command of the bridge-brigade. He built the entrenchments around Murfreesboro, Tenn., and was engaged in the battles at Chattanooga and Chickamauga. He was chief engineer of the Ninth army corps in the Richmond campaign of 1864, and was killed in the battle of Petersburg. He published 'An Essay on Instruction in Engineering' (1856); 'Memoir on Fortification' (1858); 'Life of Maj. John Saunders, of the Engineers' (1860), etc.

MORTON, John, English prelate: b. Milborne, Saint Andrew, Dorsetshire, England, about 1420; d. Knoll, Kent, 15 Sept. 1500. He studied at Balliol College, Oxford, and subsequently became principal of what is now Christ Church College. He adhered with great fidelity to Henry VI and the house of Lancaster, but nevertheless Edward IV made him master of the rolls and bishop of Ely (1478). Richard III imprisoned him, but he escaped to Flanders and under Henry VII became archbishop of Canterbury and chancellor (1486). It was he who suggested the union of the house of Lancaster and York by the marriage of Henry with Elizabeth of York, daughter of Edward IV. In 1493 he became a cardinal.

MORTON, John, one of the signers of the Declaration of Independence: b. Ridley, Delaware County, Pa., 1724; d. April 1777. After working for several years as a surveyor he began the practice of law. In 1764 he was

elected to the general assembly of Pennsylvania, of which he became a conspicuous member, serving for a number of years and being speaker from 1772 to 1775. In 1765 he was a member of the Stamp Act congress; in 1766 became sheriff in his county, and was shortly afterward appointed one of the judges of the Supreme Court of Pennsylvania. He was always an earnest advocate of the rights of the colonies and warmly supported the Revolutionary War. In 1774 he was elected a delegate to the 1st Continental Congress, and was a member of that body till his death, taking active part in its debates and in the framing of the Articles of Confederation. He gave the casting vote of Pennsylvania in favor of the Declaration of Independence, the four other delegates present from that State being equally divided as to the measure, and affixed his signature to the Declaration.

MORTON, John Maddison, English dramatist: b. Pangbourne, 1811; d. 1891. He was educated in France, then held a clerkship in Chelsea Hospital, London (1832-40). In 1881 he became a Charterhouse brother when in sore need of a pension. He wrote farces, showing exceptional facility in the adaptation of French dialogues to suit English taste. While he was a prolific writer of plays little survives for recent presentation except his ever-popular 'Box and Cox' (1847). Consult 'Dictionary of National Biography,' Vol XXXIX (London 1894).

MORTON, Julius Sterling, American agriculturist and statesman: b. Adams, N. Y., 22 April 1832; d. Lake Forest, Ill., 27 April 1902. He was graduated from Union College in 1854 and removed to Nebraska City in 1855, where he was editor of the *Nebraska City News*. In 1856-57 he was a member of the Territorial legislature, and in 1858 secretary of the Territory. Upon the resignation of Governor Richardson in 1858 he acted as governor, and in 1893-97 was Secretary of Agriculture under President Cleveland. He was the originator of Arbor Day and an active member of various agricultural and horticultural societies.

MORTON, Levi Parsons, American banker and politician: b. Shoreham, Vt., 16 May 1824; d. Rhinebeck, N. Y., 16 May 1920. In 1843 he established a mercantile business at Hanover, N. H.; in 1850 entered the banking business in Boston; and later removed to New York, where in 1863 he founded the large banking firm of Levi P. Morton & Company (later Morton, Bliss & Company), which assisted in floating the government war loan during the Civil War. He also established a branch of his firm in London, and the Morton Trust Company of New York, and gained a reputation as an able financier. He was elected to Congress on the Republican ticket in 1878 and served one term (till 1881); he was then appointed United States Minister to France, where he remained till 1885; in this capacity he secured legal status in France for American corporations. In 1888 he was elected Vice-President of the United States, and made an especially able presiding officer in the Senate. In 1894 he was elected governor of New York State, serving for one term; in the last year of administration he urged in a special message the abolition of the

ward-trustee system of school government in New York city public schools, and signed the all which enforced this reform. In 1896 he was New York State's candidate for the Presidency at the National Republican Convention. After retiring from public life he resumed his banking operations and became a director in several insurance companies.

MORTON, Nathaniel, American historian: a. Leyden, Holland, about 1613; d. Plymouth, Mass., 29 June 1685. He was of English descent, came with his father to Plymouth in 1623, became an inmate of Governor Bradford's family and his public assistant, and from 1645 until his death was secretary of the colony. In compliance with the request of the commissioners of the New England colonies, he compiled (1669) and published his principal work, 'New England's Memorial, or a Brief Relation of the Most Remarkable and Memorable Passages of the Providence of God Manifested to the Planters of New England.' For nearly two centuries, or until Bradford's 'History of Plymouth' was discovered in 1855, Morton's work was the principal authority on the matters it dealt with. He compiled it largely from Bradford's manuscripts and Edward Winslow's journals. 'New England's Memorial' was several times reprinted in the American colonies, and was also reproduced in England. Besides numerous other works, Morton was also the author of 'A Synopsis of the Church History of Plymouth' (1680).

MORTON, Oliver Perry, American statesman: b. Salisbury, Wayne County, Ind., 4 Aug. 1823, d. Indianapolis, 1 Nov. 1877. He studied law, was admitted to the bar in 1846, began the practice of his profession in Centreville, Ind., and became a circuit judge in 1852. He was an anti-slavery Democrat, but, after being cast out of the party for his refusal to support the Kansas-Nebraska bill, became one of the leaders of the new Republican party, and was defeated as its candidate for governor in 1856. Four years subsequently he was elected lieutenant-governor, and when, in January 1861, Governor Lane was elected to the national senate, Morton became governor. His active loyalty to the government did much to sustain the administration during the trying times of the Civil War. At its outbreak he at once sent troops to the field, but in the next year was greatly hindered in his efforts by a hostile legislature and subsequently by the efforts of a secret, disloyal society known as the Knights of the Golden Circle. Several plots at his assassination were hatched. Nevertheless he surmounted all obstacles, and his services to the nation were thankfully recognized by its chiefs. He was elected a United States senator from Indiana as a Republican in 1867, serving till 1877, and in the latter year was a member of the Electoral Commission. Consult 'Life,' by Foulke (1899). After the close of the Civil War he had been stricken with paralysis in his lower limbs, but his intellectual powers rose above his physical disability, and he continued until his death one of the most eloquent, forceful and dominating figures in public life. The fact that he sometimes addressed the Senate standing supported by two canes earned for him the waggish sobriquet of the "Devil on Two Sticks."

MORTON, Paul, American financier and politician: b. Detroit, 22 May 1857; d. New York, 1911. He attended the Nebraska public schools, and at the age of 16 started his commercial career as office boy in the land office of the Burlington and Missouri River Railroad, at Burlington, Iowa; after several promotions he entered the employ of the Chicago, Burlington and Quincy Railroad, rising from clerk to chief clerk, then successively assistant general freight agent, general passenger agent, and general freight agent. In 1890 he became vice-president of the Colorado Fuel & Iron Co., for six years, when he accepted the vice-presidency of the Atchison, Topeka and Santa Fé Railroad, greatly distinguishing himself in railroad and public affairs. He influenced great advances in the railroad system, and was a true friend and advocate of the rights of the employees in large corporations; also favored publicity as assisting in the work of the investing public and productive of honesty in management. Until 1896 he had been very staunchly Democratic but the "silver question" won him over to the Republican party. In 1904 he was appointed by President Roosevelt Secretary of the Navy, but he retired (1905) to become president of the Equitable Life Assurance Society of New York. He thoroughly reorganized the corporation's system and advanced to fruition many measures that brought about uniformity in tariffs and stability in executive departments of insurance. His death occurred suddenly and unexpectedly as he was, unaccompanied, passing between the different public offices in the course of business.

MORTON, Samuel George, American anatomist: b. Philadelphia, Pa., 26 Jan. 1799; d. there, 15 May 1851. He studied medicine at the University of Pennsylvania and in Edinburgh; began to practice in Philadelphia in 1824; was immediately prominent in the Academy of Natural Sciences being its secretary 1825 and its president 1850; became professor of anatomy in Pennsylvania College in 1839; and made special studies of ethnology, craniology and plant physiology. His valuable collection of skulls, numbering 1,500 specimens (900 human), led him to urge the diverse origin of the human race. He contributed to *Silliman's Journal*, and published 'Crania Americana' (1839); 'Crania Egyptica' (1844), and 'Illustrated System of Human Anatomy' (1849). Consult 'Life' by Meigs (1851).

MORTON, Thomas, English prelate: b. York, 1564; d. 1659. He studied at Saint John's College, Cambridge, receiving the degrees M.A. (1590), and D.D. (1606), becoming a Fellow and university lecturer in logic. He became one of the chaplains of James I and (1606) dean of Gloucester, was transferred (1609) to deanery of Winchester, to canonry of York (1610) and was made bishop of Chester in 1616. He was translated to Litchfield and Coventry (1618), in which fields he devoted his endeavors to win over the Nonconformists and recusants. In 1632 he was appointed to the see of Durham, holding the position canonically till his death, though Parliament decreed his deprivation in 1647. He had been impeached (1641) on the fall of Charles I, but was released after four months' imprisonment without trial, and was again imprisoned in 1645

because he refused to surrender the seal of Durham. After being driven (1648) from Durham House, London, he ultimately resided at Easton-Maudoit with Sir Christopher Yelverton. Most of his written works were devoted to exposure of Romish fallacies. His three most noted works are 'Apologia Catholica' (1605); 'Catholic Appeal' (1609); 'Causa Regia' (1620).

MORTON, Thomas, English colonist in America: b. England about 1575; d. Agamenticus (or Acomenticus), Me., 1646. He was an attorney of Clifford's Inn, London, of a somewhat doubtful reputation, and seems to have practised mainly in western England. In 1622 he landed in New England, where he remained three months; and in 1625 returned with Wollaston's Company. Wollaston soon after left for Virginia, and in the summer of 1626 Morton assumed control over those of Wollaston's following that remained. The settlement, Mount Wollaston (now Braintree, Mass.), near the coast, he called Mare Mount (Merry Mount); and in the spring of 1627 he erected a Maypole, and with the "salvages" proceeded to hold May-day to the scandalizing of their Puritan neighbors of Plymouth. Contrary to law, he supplied the Indians with firearms and instructed them in their use; and he was a rival of the Plymouth settlers in the fur-trade. He was accordingly arrested by Capt. Miles Standish and sent back to England (1628). But in August 1629 he was again in New England. In August or September 1630 he was a second time arrested and banished. He published, in 1637, 'New English Canaan,' which Nathaniel Morton ('New England's Memorial') denounces as "full of lies and slanders, and full fraught with profane calumnies," but which as a satire is sometimes not unamusing, and contains information of interest regarding local features and the Indians. When he ventured back to New England (1643) he was imprisoned for about a year while evidence for a libel suit was being collected, and was finally let go on payment of a fine of \$500. Nathaniel Hawthorne's 'The Maypole of Merry Mount' (in 'Twice-Told Tales,' 1837) and J. L. Motley's 'Merry Mount' (1849) are based on Morton's career.

MORTON, William James, American physician: b. Boston, 3 July 1845; d. 1920; son of W. T. G. Morton (q.v.), whose name is connected with the first anæsthetic use of ether. He was educated at the Boston Latin School, Harvard University and Vienna. On his graduation there, in 1872, his thesis on "Anæsthetics," gained him the Boylston prize. He practised medicine at Bar Harbor, Me., and in Boston; went to Kimberley, South Africa, where, besides practising his profession, he engaged in diamond-mining. Settling in New York he became editor of the *Journal of Nervous and Mental Diseases*; from 1882-85 was adjunct professor of nervous diseases at the New York Post-Graduate Medical School; served as neurologist to the New York Infant Asylum, 1887-90; and was afterward professor of nervous diseases and electrotherapeutics at the New York Post-Graduate School. As an authority in electrotherapeutics he won wide recognition, and by his mechanical device for establishing the "static induced current" of elec-

tricity—the "Morton current" of the scientific world—supplied a means for producing the X-ray, and rendered a service of great practical value to medicine and surgery. Indicted in January 1912, in association with Julian Hawthorne and others, on a charge of fraudulent use of the mails in the promotion of bogus mining companies, conviction followed nearly a year after; he was sentenced to 12 months' imprisonment, but was released in October 1913, pardoned by the President and reinstated in his profession.

MORTON, William Thomas Green, American dental surgeon: b. Charlton, Mass., 19 Aug. 1819; d. New York, 15 July 1868. He established himself in the practice of dentistry in Boston, and there in March 1844 became a student of medicine in the office of Dr. C. T. Jackson (q.v.), the scientist. In November 1846 he obtained a patent for the process of anæsthesia by what he called "letheon," now known as ether. Jackson claimed the discovery of etherization previous to the winter of 1841-42, and Morton's patent was contested by both Jackson and Horace Wells, another of Jackson's pupils. Morton communicated his knowledge of the process to Dr. J. C. Warren, and anæsthesia by ether was made public through an operation performed by Warren at the Massachusetts General Hospital 16 Oct. 1846. The French Academy of Sciences investigated the matter and decreed a Montyon prize of 2,500 francs to Jackson for the discovery, and another of like amount to Morton for the application of the discovery to surgical operations. In 1852 a bill appropriating \$100,000 as a national testimonial to Morton was introduced in Congress, but failed, as it did also in 1853 and 1854. Testimonials accrediting to him the application of ether as an anæsthetic were signed by the medical profession in Boston (1856), New York (1858) and Philadelphia (1860). Consult Weyman, 'Trials of a Public Benefactor' (1859).

MORTUARY CUSTOMS. See BURIAL; DEAD, DISPOSAL OF.

MORWITZ, mor'vits, Edward, German American journalist: b. Dantzic, Prussia, 12 June 1815; d. Philadelphia, 13 Dec. 1893. After thorough training in the sciences and medicine at various German universities, he was graduated in 1840 from Berlin University, where he became an assistant physician and wrote 'The History of Medicine' (1848-49). In 1843 he practised his profession at Conitz, Prussia, but after the Revolution of 1848 settled in the United States. In 1853 he bought the German *Democrat* of Philadelphia and in 1855 issued a German political weekly, *The United States Journal*, followed in the same year by a German Sunday paper, *The New World*. He gave great support to the Union during the Civil War, and assisted in the raising of troops and the placing of government loans. In 1862 he took a leading part in establishing the German Press Association of Pennsylvania, and in 1870 organized the movement to raise funds for aiding German soldiers in the Franco-German War, about \$600,000 being received for that purpose. He at one time owned or controlled about 300 newspapers, both German and English, and was a powerful factor in welding together the German population of the State.

He invented a breech-loading gun before leaving Germany.

MOSAIC, an imitation or reproduction of painting or ornamental design, formed generally by means of pieces of opaque glass of different colors; also by colored stones (especially marbles and precious stones) placed side by side, and attached by being bedded in a cement. The art originated in the East, but received its perfection from the Greeks, and was thus conveyed to the Romans. In Italy many floors ornamented with mosaic work have been found among ancient ruins. Afterward, when the art was revived in Italy, the Venetian school becoming very celebrated, Clement VIII, in the 17th century, had the interior of the dome of Saint Peter's decorated with this kind of work. The art was largely employed for copying painting by famous artists, and thus rendering permanent their original freshness and beauty. The Roman school of mosaicists is still the most famous, though excellent works have been produced in recent times by Venetian and also by Russian artists. There is a studio for the production of mosaics in the Vatican at Rome. The most important works executed here in recent times are a series of portraits of the popes. In the most costly mosaics precious stones have been cut to furnish materials; but in common works of this art enamels of different colors, manufactured for the purpose, are the material employed. Roman enamels are made of small rods of opaque colored glass. In the first place cakes of glass are made of every variety of color and shade likely to be required. As many as 10,000 shades are said to be in use. These cakes are drawn out into rods thicker or thinner, according as they are to be used for finer or for coarser work, a great number being mere threads. They are kept in bundles, and arranged in sets corresponding to their colors. For a work of moderate size a piece of dark slate or marble is prepared by being hollowed out like a box and filled with plaster of Paris; upon this plaster the artist draws the design or pattern, and the workman proceeds with his work by removing small squares of the plaster, and filling in these with pieces cut from the glass rods, the pieces being fixed in their places by a cement. Gradually, in this manner, all the plaster is removed, and a picture is formed by the ends of the pieces of colored glass. It will easily be understood that this is a very slow process, and there are large pictures that have taken as many as from 12 to 20 years to produce. When mosaic pictures are to be viewed near at hand they are polished perfectly smooth with a flat stone and emery, and present a glossy surface similar to that of paintings in oil. When they are to be viewed at a distance the surface is left rough, when they present an appearance similar to pictures in fresco. Inlaid works, of agate and other costly stones, are executed on the same principle as mosaic, except that the stones are larger, and cut to the shape of different parts of the object to be represented. Works of this class are known as Florentine mosaics. Flowers and ornamental designs are the chief objects of this branch of the art. A mode has been invented of sawing the plate with the mosaic pictures into two or three sheets, and thus increasing the number of works produced at one time. Consult Barwell

and Druitt, 'Mosaics and Stained Glass' (New York 1909); Furnival, W. J., 'Leadless Decorative Tiles' (Stone, Staffordshire, 1904).

MOSANDRIUM, or **MOSANDRUM** (from K. G. Mosander, a Swedish chemist), supposedly a new rare earth metal, whose oxide was thought to have been discovered in 1878 by Lawrence Smith, in specimens of the mineral samarskite obtained from North Carolina. It was afterward shown to be a complex substance containing terbium, samarium, dysprosium, traces of praseodymium and neodymium and probably gadolinium.

MOSASAURIA, an order of marine reptiles of the Upper Cretaceous Period, typical of the reptilian subclass *Pythonomorpha*. They were of world-wide distribution and their remains occur so plentifully in the western United States as well as in the Old World that their structure is thoroughly known. They were large predaceous marine lizards, resembling the modern monitors in many features, but reaching in many species the size of crocodiles—larger in some cases, but no skeletons are known indicating a greater length than 45 feet. They had four limbs with all the bones well developed but enclosed in a mitten of flesh and skin, forming paddles, which, with their great tails, must have made them powerful and agile swimmers. "Their cup-and-ball vertebræ indicate great flexibility of the body, their sharp teeth denote ability to capture slippery prey, and the structure of the lower jaw shows that they probably ate in a hurry and swallowed their food entire. . . . In the mosasaurs, as in the cormorants, among birds, there is a sort of joint in each half of the lower jaw, which permits it to bow outward when open; . . . if the reader will extend his arms at full length, the palms touching, and then bend his elbows outward, he will get a very good idea of the action of a mosasaur's jaw"—Lucas. The mosasaurs were of three types, namely, *Tylosaurina*, resembling gavials, with a long slender beak or extension of the snout beyond the teeth, and long paddles strengthened with numerous phalanges; *Platecarpine*, short-headed, very long-tailed reptiles, including *Platecarpus*, *Prognathosaurus*, *Brachysaurus* and some other genera; and *Mososaurina*. The last were the typical mosasaurs, apparently the most completely marine and powerful and perfected of the race. The two genera are *Mosasaurus* and *Clidases*. None survived the close of the Cretaceous. Consult Zittel-Eastman, 'Text-book of Paleontology' (1902), in which will be found detailed and illustrated descriptions of various forms, and many references to the literature of the subject.

MOSAYLIMA, mō-sā-lē-mā, or **MOSEI-LEMA**, Arab prophet and rival of Mohammed (q.v.): b. early in the latter half of the 6th century; d. 633. He seems to have been a prophet in the tribe of Bani Hanifah, in Nejd, before Mohammed arose; and his name Rahmān, "the merciful," one of Mohammed's favorite titles for Allah, may be held proof that he claimed to be the Messiah. Tradition says that Mohammed scornfully refused Mosaylima's suggestion that they should share the spiritual leadership of the earth; but modern criticism makes it more probable that the Prophet compromised with him considerably, and it is even suggested

that Mohammed wished to make him his successor by testament, but was prevented by his attendants as he was dying. A break between Abu Bekr, the caliph, and Mosaylima came speedily; perhaps Mosaylima even openly opposed Islam. At any rate in the 11th year of the Hegira, his forces though far superior in numbers were met and defeated by Khaled, the Sword of God.

MOSBY, möz'bi, **John Singleton**, American lawyer and soldier: b. Edgemont, Powhatan County, Va., 6 Dec. 1833; d. Washington, 30 May 1916. He was graduated at the University of Virginia (1852), admitted to the bar (1855) and was practising law at Bristol, Va., when the Civil War broke out. He enlisted as private in the Confederate army and was later promoted adjutant of the 1st Virginia Cavalry. In two months' time, however, he was reduced to the ranks. Mosby, undaunted, then offered his services as scout to Gen. James E. B. Stuart, and in that capacity guided Stuart's cavalry in a desperate raid on McClellan's army on the Chickahominy in June 1862. In 1863, after enduring a short captivity, he went to Richmond and recruited an independent body of fighters which soon became famous under the name of Mosby's Partisan Rangers. This small cavalry command, of which he was colonel, became a terror to the Union troops and did much damage in cutting off means of communication and destroying supply trains, capturing outposts, etc. They adopted a guerrilla style of warfare and operated through Virginia and Maryland. Subsequently his force was pressed into the regular Confederate army as the 43d battalion of Virginia cavalry, and served till the cessation of hostilities. His men were dispersed and concealed when not engaged in raiding, and he had in force a perfect system of reassembling them at the shortest notice. At Chantilly (16 March 1863) he defeated a much larger force than his own. Probably his most brilliant exploit was the capture of Brigadier-General Stoughton, United States army, at Fairfax Courthouse, in the same month. To accomplish this he made a raid inside the Federal lines. At Danesville (1 April 1863) he successfully defended himself against a force sent especially to capture him. He harassed the rear of Grant's army, in its advance on Fredericksburg, to such an extent that Grant was forced to send a special detail to protect his communications and supplies. One of Mosby's most important raids resulted in the capture of Sheridan's entire supply train, which he surprised near Berryville.

Mosby was commissioned captain in March 1863, major two weeks later and colonel some time after that. His regiment was disbanded 21 April 1865, and he again took up the practice of law, settling at Warrenton, Va.

Mosby became a Republican after the War and supported General Grant for the presidency. It is said he originated the phrase "the solid South." He was United States consul to Hongkong 1878-85, afterward practised law in San Francisco, Cal., and was assistant in the Department of Justice at Washington 1904-10. He delivered a lecture in Boston, on Stuart's Cavalry, in December 1886, which was afterward published in book form and entitled 'War Reminiscences' (1887). He also wrote 'The Dawn of the Real South' (1901). Consult

Crawford, 'Mosby and His Men' (1867); Scott, J., 'Partizan Life with Mosby' (1867); Williamson, 'Mosby's Rangers' (1896).

MOSCHELES, Felix, British portrait painter: b. London, 8 Feb. 1833; d. Tunbridge Wells, January 1918. He was the son of Ignaz Moscheles, the distinguished pianist and composer, and the life-long friend of the great Mendelssohn. Felix was educated at King's College, London, and was then sent to Hamburg and Karlsruhe. His childhood was spent amid a circle of literary and artistic celebrities including Mendelssohn, Joachim, Malibran, Lablache and Dante Gabriel Rossetti. In later years the list was extended by many of the most famous characters of the age. In 1846 his father migrated to Leipzig to take over the directorship of the Conservatoire. Here Felix was taught drawing and architecture. In 1850 he went to Paris to pursue his art studies, arriving in the days of the Republic which followed the flight of Louis Philippe, and he witnessed the *coup d'état* which placed Napoleon III on the throne. A lucky arrest brought Moscheles into touch with Mme. Achille Fould, whose husband was then at the head of affairs, and who was a friend of the Moscheles family. The young artist was introduced into the best circles of Parisian society. At the Atelier Gleyre, where he studied, he made the acquaintance of Du Maurier, afterward the famous *Punch* artist. Moscheles pursued his later studies in Antwerp, where Alma-Tadema, Maris, Neuhuys and Heyermans were his fellow-students. He afterward opened a studio and settled in London, where he and Du Maurier formed a merry circle with Poynter, Whistler, Stacy Marks and Charles Keene. In 1862 he painted a portrait of Mazzini, which after the latter's death he offered to the Italian nation, but the offer was refused. Moscheles had long been interested in the question of universal peace and international arbitration. He discussed this subject with President Cleveland during a visit to America in the '80's, when he crossed the Atlantic with Henry Irving carrying an introduction from Robert Browning. He painted Cleveland's portrait and later one of Browning, which is now in the Armour Institute, Chicago. Among his works are studies of Gounod, Rubinstein and Sir H. M. Stanley. He exhibited in Antwerp, Paris and London, and published two volumes of autobiography, 'In Bohemia with Du Maurier' and 'Fragments of an Autobiography,' besides editing Mendelssohn's letters to his parents. He was president of the International Arbitration and Peace Association and of the London Esperanto Club.

MOSCHELES, Ignaz, German pianist and composer: b. Prague, 30 May 1794; d. Leipzig 10 March 1870. Of Jewish parentage, studied under J. D. Weber, director of the Prague Conservatory of Music, and afterward under that of Albrechtsberger and Salieri, at Vienna. On the completion of his studies he made a successful professional tour in Germany, and in 1820 arrived at Paris, where he met with an exceptionally enthusiastic reception and afterward made tours of other continental capitals. In 1825 he settled in London, where he was professor of music at the Royal Academy for 21 years. Here he had Thalberg for a pupil.

he had formerly, in Berlin, had Mendelssohn. At the latter's request he went from London to Leipzig where he was professor of music in the conservatory there from 1846 till his death. Among his finest compositions may be mentioned his Concertos Nos. 3, 4 and 5, the Concertos Fantastique and Pathétique; his great Sextette and Trio; his Sonatas Caractéristique and Mélancolique; and the duo for pianoforte, *Hommage à Händel*.

Consult *Briefe von F. Mendelssohn-Bartholdy an Ignaz und Charlotte Moscheles* (1888).

MOSCHEROSCH, mōsh'ĕ-rōsh, **Johann Michael** (properly MOSENROSH; pen name PHILANDER VON SITTEWALD), German satirist: b. Willstatt, near Strasbourg, March 5, 1601; d. Worms, Germany, April 4, 1669. He was a descendant of an Aragon (Spanish) family, and was educated at Strasbourg. After various government appointments in different places, he became privy councillor to the landgravine of Hesse-Cassel.

He was admitted to the Fruchtbringende Gesellschaft in 1645 with the surname "Der Traumende" ("the Dreaming One" or "the Dreamer"). His works include: *Wunderliche und Wahrhaftige Gesichte Philanders von Sittewald*, a keen satire on the manners and customs of his time, and written in the style of Francisco Gomez de Quevedo y Villegas' *Los Sueños*. Other works are *Insomnis cura parentum*, *Christliches Vermächtnis eines Vaters*; and *Die Parthenia*, the manuscript of which was found in the municipal library at Hamburg, Germany, in 1897.

MOSCHUS, mōs'kūs, Greek bucolic poet of Syracuse in Sicily, flourished about 150 B.C. Four idyls form the whole of the remains of Moschus, which exhibit great elegance of style and delicacy of conception. The *Εὐάφιος θύμνος* (*Lament for Bion*) was imitated by Shelley in *Adonais*.

A translation by J. M. Edmonds was published in 1912. The works of Moschus have commonly been edited with those of Bion (q.v.) and Theocritus (q.v.), and the three have been well translated by Andrew Lang (1889). See also THEOCRITUS, BION AND MOSCHUS, IDYLS OF.

MOSCOSO DE ALVARADO, mōs-kō'sō thā āl-vā-rā-thō, **Luis de**, Spanish adventurer: b. Badajoz, Spain, about 1530; d. Peru, about 1560. He served under his kinsman Pedro de Alvarado in his expedition to Guatemala in 1523-1527 and in 1534 accompanied him to Peru where he was for two years a follower of Pizarro, and then returned to Spain to live in luxury for several years on the proceeds of his services. In 1538 he attached himself to De Soto's expedition to Florida and upon the latter's death in 1542 took command and after many hardships succeeded in returning to Mexico. He was honored by the viceroy, Antonio de Mendoza, and in 1551 accompanied him to Peru where he was entrusted with important commands until his death.

MOSCOW, town, Idaho, and Latah County seat; altitude 2,564 feet; 95 miles southeast of Spokane, Washington; on the Northern Pacific; Great Northern; and Union Pacific railroads. The town is in the heart of the fertile Palouse country. White pine and mixed timber, wheat,

hay, and peas are grown near by, and the town is a center for the pea industry. Other industries are concerned with lumber, seed, harvesters, creameries, flour and brick. The University of Idaho (q.v.) is here. Moscow was settled in 1879 and incorporated in 1887. Pop. (1940) 6,014; (1950) 10,593.

MOSCOW (Rus. Moskva), city and capital, USSR, located approximately in the center of European USSR, at latitude 55° 45' N. and longitude 37° 37' E. Though in the western part of the Soviet Union, the city lies close to the USSR center of population. Moscow is situated on both banks of the Moscow (Moskva) River, a tributary of the Oka, which in turn flows into the Volga. It is 550 feet above sea level on slightly hilly territory in the wooded steppe zone of mixed woods and meadows. In configuration, it resembles a rough circle surrounding the Kremlin, which was the original settlement in medieval times, and is today the residence of the USSR Communist rulers.

The Kremlin is one of the greatest remaining monuments of medieval Russian architecture. It is a huge citadel, a virtual little town of palaces, churches and government buildings, surrounded by stone walls 40 feet high and 12 feet thick. On top of several of the wall towers are huge red transparent stars, which are lighted at night. One side of the Kremlin faces the Moscow River. Around the other sides is the region of the "central squares," of which the most famous is Red Square, the site of Lenin's tomb and the place of the huge annual civilian and military parades. The central squares were in medieval times surrounded by the so-called Chinese Wall, most of which however has long since been torn down. Here are the main governmental buildings, the larger theaters and hotels, and the main shopping district. From this central core, wide avenues radiate out in all directions, leading toward neighboring cities, whose names they often bear. As one travels out these avenues, one crosses two boulevards, A and B, both circling the city center, some distance out. Originally both were city walls, which later were demolished as superfluous in modern times. Today city suburbs even extend far beyond boulevard B, the outermost of the two.

Moscow's climate is cool and continental. The average temperature for July is 65.6°F.; for January, 14°F. Winter temperatures as low as -44°F., however, are not uncommon. Because of its northerly location, summer days are very long, while winter daylight lasts only six hours. Rainfall is adequate, with an annual precipitation of 24.1 inches. The heaviest rains fall at the end of summer.

All the leading organizations of the Soviet regime are located in Moscow. Here can be found the headquarters of the USSR Communist Party, including its Secretariat, Presidium, Central Committee and Propaganda Administration. The Councils of Ministers (cabinets) and Supreme Soviets (legislatures) of both the USSR and the Russian Soviet Republic meet and work in Moscow. All USSR cabinet ministries are in the city, including the State Planning Committee, USSR Army and Navy headquarters, and the main offices of the Soviet secret police. As the site of the State Bank, Moscow is the financial center of the entire USSR. Other organizations of nationwide authority in the city

include: the Central Council of USSR Trade Unions, the Secretariat of the Young Communist League, and the Central Council of the Voluntary Society to Aid the Army, Navy and Air Force.

Moscow is the scientific and propaganda center of the USSR. It is the seat of the USSR Academy of Science, and contains 82 colleges and universities. The largest center of book publishing in the Soviet Union, here are published the USSR's two main newspapers: *Pravda* (organ of the USSR Communist Party), and *Izvestia* (organ of the USSR government). Moscow also contains 40 stage theaters, of which two are world famous: the Bolshoi (Grand) opera and ballet theater, and the Moscow Art Theater (dramatic). In addition there are many museums, including the Tretyakov art gallery with its collections of the major works of the great Russian artists.

Moscow is also the center of railway transportation in the Soviet Union. Eleven railways radiate out of the city in all directions, not counting the belt railroad circling Moscow in the suburbs. The city is likewise the air transportation center in the USSR, airlines radiating out in all directions to the capitals of all Soviet republics, Leningrad, the Crimea, the Arctic, and even to Vladivostok. Large airports ring Moscow, some civilian but most of them military. Paved highways run from the city to Leningrad, Minsk, Ryazan, Voronezh, Gorki, and Yaroslavl. A newly completed auto road connects Moscow directly with the Crimea.

Great efforts were made during the 1930's and 1940's to improve the Moscow River port. An 80-mile canal was dug north of the city to divert Volga water into the Moscow River. This canal serves a triple purpose. First, it ensures the city an adequate supply of water. Second, hydroelectric power stations along the canal and its reservoirs help supply Moscow's enormous demands for electricity. Third, deep-draft Volga River ships can now reach the Moscow River port. By using various river systems and connecting canals, it is possible to sail from Moscow to the Baltic, White, Black, Azov, and Caspian seas, for which reason the capital is now called a "port of five seas." Nevertheless, most freight and passengers still enter and leave Moscow by rail.

Despite great decentralization of industry during the Soviet regime, Moscow today remains the largest industrial city in the Soviet Union, accounting for 15 per cent of all USSR industrial output. In czarist days, the capital was a huge center for textile industry, and was even known as the "city of calico." Today, Moscow contains almost every branch of manufacturing industry, including huge heavy industries. Most Moscow industries are those requiring technical skill, and take advantage of the large pool of skilled labor which Moscow possesses by virtue of its early industrialization. The chief branch of industry today is machinery manufacture, with concentration on complex and precision machines. In many instances, the pilot plants for new Soviet industries were first built in Moscow, which then loaned its experienced personnel to factories constructed later in other regions. The city contains the Stalin auto plant (the second largest truck factory in the USSR), and is a major center of aircraft design and manufacture. Other major products include watches, machine

tools, and electrical equipment of all types. There also are large steel, synthetic dye, lumber, confectionary, baking, and sausage industries. The old czarist textile mills have been modernized and expanded under the Soviet regime, and Moscow is still one of the two leading textile centers of the USSR.

To supply all these industries with electricity, Moscow has a large number of steam electric power stations operating both in and outside the city, and using peat and lignite as fuel. Those in the city often provide heat for the houses of their district, as well as current. In addition, Moscow receives hydroelectric power from stations as far away as the upper Volga. Natural gas is piped into the city from the Saratov gas fields several hundred miles away on the lower Volga.

Moscow's huge industries require enormous quantities of raw materials which are transported to the city from all parts of European USSR, the Caucasus, and even from Asiatic USSR as far east as mid-Siberia. Altogether, 25,000,000 tons of freight flow into the city each year, the largest items being building stone, bricks, timber, coal, metal, grain and oil. Annual outgoing freight shipments are much smaller, only 5,000,000 tons, because Moscow specializes in production of machines and goods high in value but light in weight. The main items shipped out are machines, textiles and books, Moscow supplying these products to all parts of the USSR, even including the Pacific coast.

Because of its crooked narrow streets and the variegated architecture of its buildings Moscow has often been called Russia's biggest village. Since the 1930's, the Soviet regime has done much to modernize the city, widening main streets and lining them with multi-story new apartment houses and government buildings. Another improvement was the construction of the Moscow subway, with each station built of marble or granite, and decorated with mosaics of colored stone. Nevertheless, Moscow still remains a city of sharp contrasts. Turning off a broad modern boulevard, one often finds himself in a crooked lane, lined with low old buildings of almost medieval style. Even more startling is the common suburban sight of a big modern apartment house and a log cabin standing side by side. The city has an acute housing shortage, and large areas of the older sections are slums. Though the vast majority of Muscovites are Russians, members of every race in the USSR can be found in the city.

History.—Moscow was first mentioned in ancient documents in 1147, when it was a small village on the site of the present Kremlin. The city was burned down by the Mongols in 1238, but revived and by the end of the 13th century was already a separate principality. Moscow's central location in European Russia was ideal for trading, since it was on a Volga tributary, and by easy portages boats could transfer from the Volga system to all other great Russian rivers west of the Urals. Trading was also encouraged by the poor soil and unsuitable climate for good crops near Moscow. Even in medieval times, the city was an emporium for trade with the Arctic, Baltic, Ukraine, Iran, Central Asia and Siberia. Early Moscow also had a long succession of able rulers, who used their power as Mongol tax collectors to bring neighboring Russian principalities under Muscovite control. When

central European Russia had thus been united, Moscow broke the Mongol yoke. In 1547 Moscovite ruler Ivan the Terrible took the title of Tsar (Caesar) and called the city the Third Rome. From then on, Moscow was the capital of the ever expanding czarist state until 1711, when Peter the Great moved his residence to St. Petersburg (now Leningrad). However, Moscow remained an important commercial city, and the czars usually lived in the Kremlin part of each year. In 1812 Napoleon captured the city, but was forced to evacuate his army when Moscow burned down. The city was rebuilt, and by 1912 had a population of 1,600,000. After the Bolshevik Revolution, Lenin in 1918 moved the capital of Soviet Russia back to Moscow, to be more safe from foreign invasion. Under Soviet rule Moscow has grown tremendously, its population more than tripling over the czarist level. In the winter of 1941, the city was besieged by German troops, who were driven back in the first major German defeat of World War II. Pop. (1950) 5,100,000.

ELLSWORTH RAYMOND,
New York University.

MOSEILIMA. See MOSAYLIMA.

MOSELEY, mōz'li, Edward Augustus, American lawyer: b. Newburyport, Mass., March 1846; d. Washington, D.C., April 18, 1911. He engaged for several years in both the East and West Indian trade. He then studied law, was admitted to the Massachusetts bar and was also a member of the state legislature for several terms. His chief interest was in the lessening of danger in railroad travel, and he became the leading authority in the United States on all measures or appliances for procuring the safety of railroad employees and travelers. Largely for this reason he was appointed secretary of the Interstate Commerce Commission at the time of its formation. His efforts in obtaining and enforcing the Safety-Appliance Law gained him testimonials from all the railroad men's organizations in the United States, and the formal thanks of the Commonwealth of Massachusetts.

He published *Arbitration as Applied to Railroads and Their Employees; Safety Appliances on Railroads; One Hundred Years of Interstate Commerce Law* (1900); *The Transportation Question as Affected by the Cullom Bill* (1900); *Federal Supremacy* (1907).

MOSELEY, Henry, English mathematician: b. Newcastle-under-Lyme, 1801; d. Olveston, Gloucestershire, Jan. 20, 1812. He was graduated at St. John's College, Cambridge, and after studying theology was ordained a priest of the Church of England. From 1831-1844 he was professor of natural and experimental philosophy and astronomy at King's College, London, and was one of the first inspectors of schools to be appointed (1844). He was appointed canon of Bristol in 1853, next becoming chaplain to the queen. He was given the degree LL.D., *hon. causa*, Cambridge, 1870.

Among his best-known works are *A Treatise on Mechanics, Applied to the Arts* (1834); *Astro-theology* (1838; 3d ed., 1860); *Lectures on Astronomy* (1839; 4th ed., 1854); *The Mechanical Principles of Engineering and Architecture* (1843), much in use to this day as a textbook and frequently re-edited and revised.

MOSELLE, mō-zêl', department, France, in Lorraine (northeastern France), having an area of 2,405 square miles. It is bounded on the north by Luxembourg, the Saar, and Germany; east by the department of Bas-Rhin (Alsace); south and west by Meurthe-et-Moselle. The capital is Metz (1946 pop. 65,472). The department is drained by the Moselle traversing its western part, the Saar in the eastern part, and the latter's tributary the Nied intermediate between the two. The chief crops are grains, potatoes, hops, and fruit. There are important mineral deposits: iron is mined in the Thionville basin, coal in the beds extending south from the Saar. The chief industry is metallurgical, in the Metz-Thionville region. Twice annexed to Germany (1871-1918 and 1940-1944), like other departments of Alsace-Lorraine it has many German speaking inhabitants. Pop. (1946) 622,145.

MOSELLE (Ger. MOSEL; Lat. MOSELLA), river, France and Germany, rising in southeastern Vosges, near Bussang, and flowing 320 miles into the Rhine. It passes Epinal, Toul, Metz and Thionville, forms the Luxembourg-Saar border, then the Luxembourg-German border. Continuing through Rheinland-Pfalz it enters the Rhine at Koblenz. Its affluents include the Meurthe, Saar, and Sûre. Navigable to Frouard (near Nancy) it is paralleled for short distances by the Est and Marne-Rhine canals.

MOSELY COMMISSIONS, two delegations known as the INDUSTRIAL and the EDUCATIONAL, which visited the United States in 1902 and 1903 to study conditions and methods in their respective branches, for comparison with those of Great Britain.

The Mosely Industrial Commission made a tour of the United States from November 1902 to January 1903, to investigate manufacturing, industrial and commercial lines, which in international competition had seriously affected the commerce and free trade policy of Great Britain. It was financed by Alfred Mosely (b. Bristol, England, 1855), a diamond merchant whose relations with American mining and other engineers in South Africa had developed the desire to discover the sources of their success, the comparative causes of Great Britain's industrial decline, and to evolve a plan whereby American methods could be introduced into the United Kingdom for the rehabilitation of its economic and industrial status. A suggestion to invite British trade unions to select a representative from each to form a commission to study American industries and the condition of the workmen was acted upon, most of the unions electing as representative their general secretary. Twenty-three formed the commission and were given a free trip to the states, with expenses paid for nearly three months. Each man was pledged to study conditions carefully and to answer fully on his return a series of tabulated questions.

Mosely and the delegates made a circular tour in which they were afforded every opportunity to inspect some of the largest manufactories in the United States. They visited Niagara, Buffalo, Cleveland, Chicago, Dayton, Pittsburgh, Philadelphia and New York, as one party, while individual members also took trips to other points. The chief results of their observations were published in the *Reports of the Mosely Industrial Commission* (London, April 1903).

Some of the conclusions arrived at were: The American workman for two and one-half days' work receives remuneration equal to that of the British for a week; the American is more temperate than the British; he lives longer; is more thrifty, and after a few years frequently retires with his savings to an easier occupation, usually farming or market-gardening. Labor saving machines were more in evidence in America than in the United Kingdom, but, there was a considerable difference of opinion among the various delegates as to what could be learned from America in their respective trades, for instance, the shipbuilding and brick-laying in England were considered superior to those of America. To the question "Are there greater opportunities for the workingman to rise in America than in England?" "Yes," came as a unanimous answer. The average workman was considered as good in one country as the other, the difference was to be found in conditions. In Great Britain generations of workers toil in a confined area, and have become hidebound by inherited labor traditions; increased production to them does not mean increased wages—hence a lack of incentive. In the United States, the stimulating climate and abundance of undeveloped resources tend to a constant striving for direct results through the simplest means, whence the wonderful development of machinery, manufacturing equipment, output, increased wages, general prosperity and well-being of the American workmen, together with a unity of feeling between employers and employees along the lines of increased production, which is not to be found in England. The organization of capital and labor in the United States produced a great impression on the delegates, and the advantages of the Civic Federation to bring together these two great and active factors in production on all disputed questions, and at the initial stages to avert strikes by arbitration, were fully recognized as those of a model organization worthy of immediate adoption. The freedom accorded to religious belief and the excellent public school education of the States elicited the warmest praise from the commission, the advantage given to all the American youth being fully apparent.

The success of the Industrial Commission led to the organization of the *Mosely Educational Commission* to the United States, October–December 1903, in which 26 prominent British educators took part at the invitation of Mr. Mosely to investigate:

1. The development of individuality in the primary schools.
2. The social and intellectual effects of the wide distribution of secondary education.
3. The effect of specific instruction given (a) in business methods; (b) in applied science.
4. The present state of opinion as to the value of professional and technical instruction of university rank, designed with special reference to the tasks of business life.

As in the work of the Industrial Commission the conclusive deductions drawn were wholly in favor of the system of education in the United States which was described as practical, enlarged, enlightened, up-to-date and scientific. Consult Mosely, 'Reports of the Mosely Educational Commission to the United

States of America, October–November 1903' (London 1904).

C. LEONARD-STUART,
Editorial Staff of The Americana.

MOSEN, mō'zēn, **Julius**, German poet: b. Marieneey, in Vogtland, Saxony, 8 July 1803; d. Oldenburg, 10 Oct. 1867. He was educated in the Plauen Gymnasium, studied law (1822) at Jena, travelled through Italy and then worked for some time under an attorney at Markneukirchen. In 1834 he settled at Dresden, taking up the practice of law, and soon becoming noted as an author. He became (1844) dramaturgist at the Oldenburg Hoftheatre, but incurable sickness greatly deterred his activities after 1848 and he was pensioned in 1850. He first came into prominence through his epic poem 'Das Lied vom Ritter Wahn' (Leipzig 1831), a very ancient Italian legend redressed in a liberal form. His 'Ahasver' (Dresden 1838) contains more of philosophy than poetry; but in his 'Gedichten' (Leipzig 1836; 2d ed., 1843) he shows national radiance in a string of ballads as 'Die letzten zehn vom vierten Regiment,' 'Andreas Hofer,' 'Der Trompeter an der Katzbach,' etc. In narrative form we have the novelle 'Georg Benlot' (Leipzig 1831), 'Bilder im Moose' (ib. 1846). His great ambition was centred in dramatical writing, but these works are too saturated with abstract rhetoric. Of his best might be mentioned 'Cola Rienzi,' 'Die Bräute von Florenz,' 'Wendelin und Helene,' 'Kaiser Otto III,' all of which are to be found in *Theater* (Stuttgart 1842), the latter being the most imposing. His talented work, 'Die Dresdener Gemäldegalerie' (Dresden 1844), should also be quoted. His works in eight volumes has been published under the title 'Sämtliche Werke' (Oldenburg 1863) and a fuller edition, including biography, was published in six volumes by his son (Leipzig 1880). Consult his 'Erinnerungen,' extended by Zschommler (Plauen 1893). 'Julius Mosen, eine biographische Skizze' (Oldenburg 1870) is anonymous.

MOSENTHAL, mō'sēn-tāl, **Joseph**, German-American musician: b. Cassel, German, Nov. 1834; d. New York, 6 Jan. 1896. F. studied music in Germany and in 1853 removed to the United States where he was organist and choir director of Calvary Church, New York, 1860–87. He conducted the famous Metelssohn Glee Club in New York in 1867–8 and played the violin in several leading orchestras there. He composed both church and secular music, among which are the psalm 'The Earth is the Lord's' and part songs for 'Thanopsis,' 'Music of the Sea,' 'Blest Pa of Sirens,' etc.

MOSENTHAL, Salomon Hermann von German dramatist: b. Cassel, 14 Jan. 1821; Vienna, 18 Feb. 1877. He studied at the University of Marburg and in 1851 obtained position under the Austrian government. His best-known dramas are 'Deborah' (1850); the original of 'Leah the Forsaken' and 'Sonnenwendhof' (1856), which were translated into English, Danish, Hungarian and Italian. He wrote also 'The German Actors' (1863); 'The Mayor of Altenburen' (1868); 'Maryn' (1871); the tragedies 'Düwke' (1860) 'Pietra' (1865). etc.

MOSER, mō'zēr, Gustav von, German dramatist: b. Spandau, Prussia, 11 May 1825; d. 1903. He obtained a military education and after serving in the Prussian army resigned in 1856 to devote himself to literature. He produced more than 100 successful comedies and farcical comedies, sometimes in collaboration; several of his works have been well received in English translations. Among his plays may be named 'Das Stiftungsfest' (1873); 'Ultimo' (1873); 'Der Bibliothekar' (The Private Secretary) (1878); 'Der Veilschenfresser' (1876); 'Krieg im Frieden' (1880). A uniform edition of his plays was published 1873-94 in 22 volumes. Consult the biography by Hans von Moser (Weimar 1908).

MOSER, Johann Jakob, German jurist and publicist: b. Stuttgart, 18 Jan. 1701; d. there, 30 Sept. 1785. He received his education at the University of Tübingen; in 1720 became teacher of law there, and in 1729 was appointed to the full professorship. In 1736 he became a director of the university at Frankfurt-on-the-Oder, but in 1739, having fallen into disfavor with Frederick William I, was compelled to resign. He then founded the academy at Hanau for the education of the young nobility in political science; and he suffered imprisonment for five years at the instance of the Duke of Württemberg, his patron. He is credited with being the first to publish a systematic account of European international law. He was a prolific writer, his books numbering over 300, the most important of which are 'Deutsches Staatsrecht' (53 vols., 1737-54, with additions of 2 vols. 1766-75, and 3 vols. 81-82); 'Lebensgeschichte' (1733). Consult the biography by Wachter (Stuttgart 1885).

MOSER, Justus, German historian and humorous writer: b. Osnabrück, 14 Dec. 1720; d. there, 8 Jan. 1794. He studied jurisprudence at Jena and Göttingen; in 1747 became attorney to the government, and for 25 years during the minority of Duke Frederick of York acted his legal adviser, and was afterward appointed a judge. His most important work is 'Osnabrücker Geschichte' (2 vols., 1768; 3d ed., 1820; Vol. III, edited by Herbert von Bar, 1824). Of his humorous writings perhaps the most striking is 'Harlekin,' in which he attacks hypocrites and pedants of all kinds. He also published some valuable essays on local topics entitled 'Patriotische Phantasien' (4 vols., 1774-86). An edition of his complete works was published by Abeken in 10 volumes (Berlin 1842-43).

MOSES. Hebrew leader and legislator, the story of whose life and work is given with such singular clearness and strength in the Pentateuch, is one of those rare names that have stamped themselves permanently on the world's history, so that we turn again and again to the simple record of his career and achievements with an interest that never lags. With all his Oriental background and the fact that his concern was primarily with his own race to lead them from bondage to freedom, there is so much breadth and suggestiveness in the laws that bear his name, his moral statutes being at the basis of modern civilization, although promulgated 3,000 years ago, that he continues a familiar and fascinating figure to all eyes.

Traditional Data.—The Biblical account, with its rapid, stirring recital, which attains at times a kind of dramatic effectiveness, tells of his birth, how his mother, in dread of Pharaoh's mandate which consigned all Hebrew children to be thrown into the Nile, concealed him for three months, then set him in an ark of bulrushes on the river's banks, where Pharaoh's daughter discovered him and had him reared as her son (Ex. ii, 1-10). His days of ease were not to last. Not all of Egypt's luxurious life and his own hopes of future power as possible occupant of the throne could dull his innate racial sense of duty. Seeing an Egyptian attacking a Hebrew, he interferes and slays the aggressor, hiding the body in the sand. Then the next day he sees two Hebrews quarreling, and when he tries to separate them, one taunts him with slaying the Egyptian. In fear of further discovery and of death by Pharaoh, he escapes to the peninsula of Sinai, dwelling with the priest of Midian, whose daughter he marries. Then follow 40 years as a shepherd, when occurred the episode of the burning bush on Mount Horeb. Now began his mission—it was his task, divinely appointed, to return to Egypt and redeem his brethren from slavery (Ex. iv, 1-9, 20). How he was met and aided by his brother Aaron, how he gained a hearing with his brethren, how Pharaoh's heart was hardened against the departure of the Hebrews, until, after a series of successive plagues, the Egyptians in their terror bade the Israelites make every haste to leave, are steps in a thrilling drama that has served as material for preacher, poet and playwright, with its incidents to-day as fresh as when first read or narrated. Now began the long 40 years' march, but the Israelites had not advanced very far, they moved slowly, being accompanied by their wives and children, their flocks and herds, when Pharaoh and his army started in pursuit (Ex. xiv, 8-9). How the panic and despair of the people are changed to exultation as the waters recede and Pharaoh's hosts are drowned in the Red Sea, while the wanderers are saved, is another of those thrilling episodes immortalized in Miriam's Song of Triumph, that belongs to the highest strains of Hebrew poetry. Then the people are led by Moses through the wilderness to Sinai or Horeb, where he received the Ten Commandments and the Law and God enters into a covenant with Israel (Ex. xix et seq.). After this culminating incident, so vividly related, Moses continues his leadership and amplifies his message from Sinai with many details as to the tabernacle, the priests, the encampments. Cautiously now he marches forward to Kadesh, from which place the spies or scouts were sent to Canaan, the ultima thule of the people's journeyings. How characteristic—they refuse to advance in their alarm at the report of the spies, and were condemned to remain in the desert until that generation had passed away (Num. xiii-xiv). Nothing is extenuated in the flaming record—every act of weakness, of rebellion, of disobedience with its invariable penalty, all are frankly and unflatteringly told. Moses resumes the march eastward, making friends and foes on the journey, but receives warning that he will not be allowed to lead the people across the Jordan as he would die on the eastern side

(Numbers 12). He gathers the tribes in consequence and gives them a farewell address, which is embodied in the book of Deuteronomy. He repeats the Law, adds his wise counsel, warns of the consequences of disloyalty and adjures the people to be faithful with an eloquence and persuasiveness that give his words perennial force. Then, after a final blessing of the multitude, he ascends Mount Nebo to the summit of Pisgah, and dies in his 120th year. The place of his sepulcher is unknown (Deuteronomy 34), doubtless for good reasons as one familiar with the history of similar founders of religions can readily understand.

Character of the Laws.—The open pages of the Pentateuch relate the character of the laws of Moses with a minuteness of detail that leaves little, if anything, untold. The code, embracing 613 statutes, covers the entire requirements of priesthood, community and individual. While his training and early life in Egypt influenced in many ways his legislation, the distinctive features are vital, with their emphasis on a purer and more rational divine belief and their elements of a democracy after which later nations in certain respects have modeled their systems. Despite the elaborate forms of priesthood and sacrifices, concessions to a people not ready for a loftier attitude, from our 20th century point of view, although our later day civilization still needs balance wheels, and holds fast to signs, symbols, forms, ceremonies of its own, the essential truths of the Mosaic laws, its insistence on personal equality and personal morality, cannot be outgrown. Its spirit of broad humanity, its consideration for the old and the young, the slave and the enemy, the fruit tree and the animal creation, its health and food regulations full of suggestions to the modern physician and dietitian, all of these show a wisdom in their author that accounts for his fame and the fact that so many of the Mosaic laws are still observed by the great majority of the people to whose ancestors the code was given.

Moses in the Legends.—It was to be expected that in course of time legends should arise as to the character of Moses and the various episodes in his career. In rabbinical literature, these have assumed a variety, a grandeur and a poetical beauty that account for their hold on the imagination for centuries to our day. To the average English reader Rev. S. Baring Gould's *Legends of the Patriarchs and Prophets* will be found stimulating. Dr. Ginzberg's *Legends of the Jews*, with its exhaustive chapters, will satisfy the more critical reader, although there is no attempt to elaborate the stories which are narrated with sober exactness. If it was denied the people to know his sepulcher and render him worthy post mortem honors, they had full license to draw upon their imagination and adorn the memory of so great a prophet, leader and law-maker by spinning the web of fairy tales in apt Oriental fashion so dear to the Semitic mind and in which the Occidental no less delights even if he assumes a more worldly-wise air. These legends stretch over his entire history from birth to death and seek to interpret in their own imaginative way, which is often far from being forced or unnatural, the scenes and incidents that he encounters, which so readily adapt themselves to the storyteller's mood as well as to the teacher's vision. It is not necessary in the limited space at command to dwell at any length on the mass of legends so quotable and stimulating. The Hellenis-

tic stories of Moses, if more limited, have a quaint interest of their own. The Mohammedan are obviously distortions or exaggerations of the rabbinical, although occasionally the treatment is original. Moses plays a part, too, in apocalyptic literature.

Modern Critical View.—Since Astruc in 1753 published his view of the composite character of the book of Genesis, due, as he stated, to the use by Moses of certain documents in its elaboration, the critics have waged a long continued battle as to the question of authorship, which has its piquant features and is still being contested almost as hotly as a century ago. The fact, too, that a parallel to the story of the birth of Moses and his experience in the bulrushes of the Nile is found in the cuneiform library of Ashurbanipal and told of Saragon, a Babylonian king who ruled, it is said, about 3800 B.C., is not without its suggestions. The etymology of the name Moses, too, has given rise to much speculation, although the Biblical account has still its doughty defenders. However, whatever the criticisms as to name, authorship, date, whatever the differences in details, the prevalent opinion as to the man himself is one and the same, as a great historical figure, who added unity and strength to a nation, after setting it free, and under Providence, shaped its destinies and gave it the essentials of a religious and civil code of laws, which later ages developed.

Bibliography.—Driver, *Introduction to Literature of the Old Testament* (New York 1897); Ginzberg, *Legends of the Jews* (Vols. II and III, Philadelphia 1909 13); Otley, *A Short History of the Hebrews* (Chap. III, New York 1901); Warrington, George, *When was the Pentateuch Written?* (London and New York).

ABRAM S. ISAACS.

MOSES, Bernard, American historian and political economist: b. Burlington, Conn., Aug. 27, 1846; d. March 4, 1930. After graduating from the University of Michigan in 1870, he went to Europe for further study receiving his Ph.D. from Heidelberg in 1873. In 1875 he became professor of history at Albion College, and in 1876 became professor of history and political economy at the University of California. His more important works were *Politics* (with W. W. Crane); *Federal Government in Switzerland*; *Democracy and Social Growth in America*; *Establishment of Spanish Rule in America* (1898). *The Spanish Dependencies in South America* (1914); *The Government of the United States* (1906). These were followed by *Spain's Declining Power in South America, 1730-1806* (1919); *Spanish Colonial History in South America* (1922), and other writings. In March 1900 he was appointed member of the United States Philippine Commission, with which he served for the next three years. He also represented the United States at Pan American congresses.

MOSES, George Higgins, American diplomat and legislator: b. Lubec, Me., Feb. 9, 1869; d. Concord, N. H., Dec. 20, 1944. In 1890 he graduated at Dartmouth College. He was a leading figure in Republican political circles at Concord, N. H., where he became, in 1898, president of the *Monitor and Statesman* Company. During 1909-1912 he was United States minister to Greece and Montenegro. From 1918 until 1933 he was United States senator from New Hampshire; from 1925 he was president pro tempore of the Senate.

MOSHEIM, mōs'him, **Johann Lorenz von**, German Protestant theologian: b. Lübeck, Oct. 9, 1694; d. Göttingen, Sept. 9, 1755. He taught at Kiel and Helmstedt prior to 1747, when he became professor and chancellor of the University of Göttingen, which he helped to found. A notable preacher and erudite theologian, he wrote several church histories, among them *Institutiones Historiae Ecclesiasticae* (1755) and *Institutiones Historiae Christianae* (1763).

MOSHER, mō'zhēr, **Eliza Maria**, American physician: b. Cayuga County, N. Y., Oct. 2, 1846; d. New York City, Oct. 16, 1928. She graduated at the University of Michigan in 1875, studied medicine in Paris during 1879–1880, and was on the staff of the Massachusetts Reformatory for Women until 1883. For the next three years she was professor of physiology at Vassar College, and from 1886 until 1896 she practiced medicine in Brooklyn, N. Y. Thereafter she was professor of hygiene at the University of Michigan until 1902, when she resumed practice in Brooklyn.

MOSKVA, mōs-kvā', Russia, an affluent of the Oka, a tributary of the Volga. Rising east of Smolensk, it flows through the city of Moscow and joins the Oka near Kolomna after a total course of 310 miles. The Battle of Borodino (1812) was fought near its banks.

MOSLEM SECTS. The first great schism in Islam (q.v.) was that which divided the community of believers into two opposing camps: the Sunnites and the Shi'ites. The Sunnites have always constituted the vast majority and are referred to as orthodox. The estimated number of Shi'ites and their offshoots are today some 45 million, about 15 per cent of the Moslem society, with Persia (Iran) and Iraq as their bulwark.

Shi'ites.—The Shi'ite sect did not crystallize until the Ommiad (Umayyad) period (661–750), but the underlying issue goes back to the time of Mohammed (q.v.). On his death in 632 the all-important question arose as to who should succeed him. Those who later became known as Shi'ites (partisans, that is, of Ali) maintained from the beginning that such an important office could not be left to the whims and fancies of the people, and that God had designated through Mohammed a successor (*khalifah*, caliph) who was none other than Ali, husband of his only surviving daughter, Fatima. They further held that the office of successorship, caliphate, to which the Shi'ites prefer the term imamate, should be hereditary, limited to the progeny of Mohammed. The murder of Ali in 661 and of his two sons and successors al-Hasan (c. 669 and al-Husain (680) did not dampen the zeal of their followers. The three were immediately raised into the rank of martyrs. In their deaths they became more influential than in their lives.

In course of time the Shi'ites became more differentiated from the Sunnites. They rejected the Sunnite books of tradition (*hadith*), differed in matters of law and ceremonies, did not regard participation in public worship as obligatory, and considered pilgrimage to the shrine of Ali, in Najaf, or to that of al-Husain, in Karbala, a permissible substitute for a pilgrimage to Mecca; and to the formula "No god but Allah and Mohammed is the prophet of Allah," they added "and Ali is the vicegerent (*wali*) of Allah." Having been always a minority and often sub-

jected to persecution, they came to believe that it was lawful for a Shi'ite in time of danger to deny his Shi'ism and profess the prevailing faith (*taqiyyah*, dissimulation). Shi'ites also consider it lawful to practice temporary marriage (*mut'ah*), which is frowned upon by the Sunnites.

Kharijites.—Another early but small sect which had its origin in a divergent view of the caliphate, which from our point of view is a political rather than theological issue, was the Kharijites (goers-out, seceders). Originally staunch supporters of Ali, the Kharijites broke away from him because he was willing to submit his right to the caliphate, when disputed by his rival Mu'awiyah, to arbitration. An offshoot of this sect survives today in Algeria, Zanzibar, and Oman, where primitive legal and theological views are held and intermarriage with Moslems is forbidden.

Qadarites.—The first important sect in Islam that split on theological or philosophical rather than political grounds was the Qadarites (from *qadar*, power), who maintained that man had power over his own actions. In this they went counter to the orthodox Islamic view of predestination, a corollary of God's almightiness strongly emphasized in the Koran. The Qadarite school of thought arose under the Ommiads, and claimed two of the caliphs as converts to their cause. Their interest in free will and self-determination indicates that the impulse came from contact with Greek Christian thought in Syria. The Qadarites were the precursors of the Mu'tazilites (separatists).

Rationalists.—To the Qadarite doctrine of free will the Mu'tazilites added another rational one, that of the denial of the coexistence with God of such divine attributes as wisdom and power. To the members of this school of thought, the attributes of God were not entities beside God. They further maintained that the Koran was not the "uncreated word of God" but a product of Mohammed's composition under divine influence. Their assertion of the supremacy of reason won them the title of the rationalists of Islam.

At the rise of this school its adherents were treated as heretics by the Sunnites, but when the Caliph al-Ma'mun, in the early 9th century, became himself a Mu'tazilite, its doctrine was made the official creed of the state. Al-Ma'mun even went so far as to establish an inquisition (*mihnah*), the only one in the history of Islam. Shortly after his time orthodoxy was restored, and the sect has become practically extinct.

Twelvers.—The Shi'ites, as nonconformists, produced the largest number of sects. They first split into two: Twelvers, and Seveners. The Twelvers, also called Imamates, transmit the successorship to Mohammed (imamate) from father to son, beginning with Ali and ending with the 12th imam, Mohammed al-Muntazar (the expected one). In 878, when still a boy, Mohammed supposedly vanished in the mosque of Samarra, Iraq, and has since lived in secret, to appear on the last day as the Mahdi (rightly guided one), a sort of Messiah. Until the present the Mahdi is still in a state of occultation, and his appearance will usher in an era of universal Islam, peace, and prosperity. Since 1502 this Twelver Shi'ah has been established as the state religion of Persia, with the shah as the temporary substitute for the hidden imam. In Syria and Lebanon, a few thousand Shi'ites have

survived under the name *Matāwilah* (friends, that is, of Ali). In Yemen, they are known as *Zaydites*, after a great-grandson of Ali. The *Zaydites* are the nearest Shi'ite faction to the Sunnites.

Seveners.—The main Seveners make the 7th imam, *Isma'il* (d. 760), their last and greatest one. Hence their other designation, *Isma'ilites*. To them, the line of "visible imams" ends in this *Isma'il*. In course of time the *Isma'ilites* deviated more and more from the body of Islam, and this resulted in a number of extreme sects considered outside the pale of Islam by the orthodox body.

As a measure of safety the *Isma'ilites* resorted to secrecy in the practice of their faith, and introduced initiatory practices. The number seven assumed sacred importance in their scheme, as it had done in the Pythagorean system. Though secretly organized, they inaugurated one of the most subtle and effective politico-religious propagandas ever witnessed by Islam. As emissaries (sing. *dā'i*) they employed clever teachers disguised as merchants and travelers who covered the entire area from Persia to North Africa.

In Iraq, a group closely allied to the *Isma'ilites* flourished under the name *Qarmatians* (*Carmania*). The appellation comes from an Aramaic word meaning peasants. These were extreme revolutionists whose violence in the 9th to 11th centuries drenched Iraq and Syria in blood. Another closely related group was organized in northern Persia under the name *Neo-Isma'ilites*. These are the people known to the West under the name *Assassins* (*hashshāshin*, cannabis addicts) and whose activity in the period of the Crusades resulted in the murder of many Frankish leaders. It was at that time that the word *assassin* was introduced into the European languages. From its birthplace in Alamut, Persia, in 1090, the *Assassin* movement spread into Syria. Certain elements there, dissatisfied with the local regime, were predisposed to the new doctrine. From his retreat in Syria "the old man of the mountain" terrorized the whole land. Remnants of this sect are found today in Syria, Persia, Afghanistan, and (particularly) in India, where their leader, the *Aga Khan*, claims descent from Ali through the Iranian founder of the order.

Fatimid Caliphate.—In North Africa, the successful *Isma'ili* propaganda resulted in the establishment of the caliphate (909-1171) whose members claimed descent from *Fatima*. This was the only Shi'ite caliphate of importance. From their capital, *Cairo*, the *Fatimids* ruled over Syria, and when the Crusaders marched against Palestine that land was a part of their domain. It was one of these caliphs, the fanatical *al-Hakim* (996-1021), whom the *Druzes* considered the final incarnation of the deity. Such a concept was a culmination of the extravagant veneration accorded Ali and his descendants by their followers.

Druzes.—The *Druzes* are so named after a missionary of Persian or Turkish origin, *Darazi*, who preached the divinity of *al-Hakim* among the mountaineers of Lebanon, in Syria, where he fell in battle about 1019. *Darazi* was the first to proclaim the divinity of *al-Hakim* in Egypt. The *Druzes* today are confined to Lebanon and Syria. In their theology and cosmogony they have retained many of the original *Isma'ili* doctrines. They indulge in no propaganda, accept no proselytes, keep their books secret in manuscript form, and divulge their tenets only to the initiated few

called '*uqqāl* (wise), as opposed to the mass of their community, termed *juhhāl* (ignorant). They practice monogamy, ignore pilgrimage and the other pillars of Islam, and do not observe regular or congregational prayers. By the orthodox their doctrines (and those of the *Isma'ilites*, *Qarmatians*, and *Assassins*) are considered extreme heterodoxies.

Nusayris.—Another ultra-Shi'ite sect which has survived in Syria is the *Nusayriyah*. Under the French mandate created in the 1920's the *Nusayris* were given a somewhat new name, *Alawites* (followers of Ali), and organized into a separate state with *Laodicea* (*al-Lādhiqqiyah*) as capital. The *Nusayris* take their name from Mohammed ibn-Nusayr, a partisan of the eleventh imam *al-Hasan al-Askari* (d. 874). They deny Ali, practice the rites of their religion in secret, and retain clear remnants of pre-Islamic pagan beliefs. Both they and the *Druzes* believe in metempsychosis. Like the *Druzes*, the *Nusayris* divide their community into two groups: The multitude of the profane, who are kept in the dark so far as the tenets are concerned; and the chosen few, who are initiated into the mysteries of the cult. There are other minor sects which, in their excessive veneration of Ali and his progeny raised these personages into titular deities and endowed them with superhuman power.

Three of the modern Islamic movements deserve special consideration: The *Baha'is* of Persia, the *Wahabis* of Arabia, and the *Ahmadiyah* of India.

Baha'is.—*Baha'ism* had for a forerunner another Persian sect called *Babism*. This was founded in 1844-1845 by *Mirza Ali Mohammed* and his successors, who held to the view of continuous and progressive Divine revelation. It is therefore, an offshoot of Shi'ism. The founder claimed descent from *al-Husain*, the Prophet's grandson, and adopted the title of *al-Bab* (the gate), whence the name of his votaries. He promulgated his mission in Shiraz, where he appeared as a kind of Messiah aiming to establish the supremacy of the imamate Shi'ah over Islam. To this end he revealed a new book abrogating the *Koran*, and was executed by order of the Persian government at *Tabriz* in 1850. Some 20,000 of his followers were likewise slaughtered. In 1909 his bodily remains were transported to Haifa, on the Palestine coast.

Thirteen years after the death of *al-Bab* a disciple of his, another Persian, *Bahau'llah* (splendor of God) by name, was accepted as the manifestation of the Divinity heralded by the *Bab*. He in turn set forth a new revelation, and addressed a series of official missives to the heads of governments in which he condemned war, preached universal peace and brotherhood, and advocated the adoption of a universal language. Fundamental in his teaching was the idea that God was unknowable except through His manifestations, the prophets, who differed outwardly but in essence were one, revealing one truth. On his death in Acre in 1892 his eldest son, *Abbas Effendi*, succeeded him under the title *Abdul Baha* (the slave of *al-Baha'*). *Abbas Effendi* resided in Acre and later in Haifa, where he died in 1921. Before World War I he visited the United States, where his followers eventually numbered several thousand, mostly in Chicago and New York.

Ahmadiyah.—Another modernist reformist sect is the *Ahmadiyah*, which also maintains missionary centers in the United States as well as

Britain. It is so-called after Mirza Ghulam Ahmad (d. 1908), a native of Qadian, in the Punjab. Ahmad began preaching in 1879. He taught that Christ was taken down from the cross while still alive and finally made his way into northern India, where he spent his last days. Ahmad considered himself as the person in whom the double mission of the expected Christian Messiah and Moslem Mahdi were united. He expounded the holy war (*jihād*) as striving after righteousness, a struggle in which weapons are spiritual rather than physical.

Wahabis.—Unlike these two modern movements, Wahabism sought reform by reaction rather than innovation. The founder was Mohammed ibn-Abd-al-Wahab (1703–1791), of Nejd. Favorably impressed by the new trends in Islamic thought and practice, ibn-Abd-al-Wahab aimed to restore Islam to the golden age of the Prophet and his early companions by stripping it of all its novel accretions. He rejected consensus of opinion as a source of authority, and condemned music and the wearing of silk and jewelry. By marriage he became allied with the ruling house of Nejd, that of Saud. In the first years of the 19th century the Wahabis had developed enough strength to impose their rule upon central and western Arabia, including the holy ones. After a long eclipse their power was re-established by 'Abd-al-'Aziz ibn-Saud, who created Saudi Arabia in 1932 and has since been its ruler.

Sufism.—No study of Islamic sects is complete without some consideration of Sufism, which in reality is not a sect but a way of life. The word comes from an Arabic term meaning wool; early Sufis wore the material in imitation of Christian monks. Sufism is mysticism as practiced in Islam. It represents a reaction against the formalism developed in the first centuries of Islam, and is an attempt to seek direct and personal relationship with the deity. Beginning on the ascetic level, Sufism grew into a syncretic system, borrowing elements from Christian, Neo-Platonic, and Buddhist sources. From the ascetic it consequently passed on into the mystic, theosophic, and pantheistic stages.

In the 13th century Sufi fraternities or orders were organized in the different parts of the Moslem world. Earliest among these was the Qadiriyya, so called after a Persian, Abd-al-Qadir al-Iraqi (d. 1166), who preached in Baghdad. This order now claims adherents in most Moslem lands from Algeria in the west to Java in the east. Another order, the Mawlawi, commonly known as that of the whirling dervishes, became especially strong in Ottoman Turkey. The superior of the order enjoyed the privilege of girding each new sultan-caliph with his sword. This order, together with others, was abolished by Mustafa Kemal (Kemal Atatürk).

Senusi.—One of the most recent and interesting brotherhoods is that of the Senusis (Sanusi), founded by an Algerian sheikh in 1837. It is a conservative militant order which had a wide influence in North Africa and succeeded in establishing a theocratic state in the desert between Tripoli and Egypt. From their headquarters in the oasis of Kufra, the warlike members of this order have caused much trouble to the Italians in Libya, and to other European colonists.

PHILIP K. HITTI.

Professor of Semitic Literature, Princeton University.

MOSLER, möz'lër, Henry, American genre painter: b. New York, June 6, 1841; d. there, April 21, 1920. He studied under James Henry Beard during 1859–1861, and in 1862–1863 he was art correspondent for *Harper's Weekly* in western campaigns of the American Civil War. The next three years were spent at schools of painting at Düsseldorf and Paris, and in 1874 he returned to Europe, first residing at Munich and from 1877 to 1894 in Paris. His *Le Retour* was the first American picture to be purchased by the French government for the Luxembourg Museum. The Metropolitan Museum of Art, New York, acquired his painting entitled *A Wedding Feast in Brittany*; and the Corcoran Art Gallery, Washington, D.C., his *Saying Grace*. Other paintings by him included *The Lost Cause*; *Last Sacrament*; *Spinning Girl*; *Rainy Day*.

MOSQUE, mösk, a Moslem house of prayer. The form of the oldest mosque was that of the Christian basilica which, however, became modified in the progress of Moslem architecture. The famous mosques of Turkey resemble the Byzantine architecture of Constantinople (Istanbul); and certain of those of India, the temples of the Jains. In course of time domes and minarets became emblematic of the more characteristic and ornate examples of Moslem art; but these are not essential, for in poor communities a bare white-washed room may suffice for the public worship of the faithful. The mosques often include, in a quadrangular area, an immense number of columns arranged in files. In numerous instances these columns are the rich spoils of antique monuments. Mosque architecture possesses no fixed rules, lightness and elegance alone being deemed the fundamental laws of architecture. Mosques contain neither altars, nor paintings, nor images. A great quantity of lamps of various kinds form the principal interior ornament, together with some sentences from the Koran written on the white walls. The buildings are often quadrangular in plan, and have an open interior court, where are fountains for ablutions. In the southeast of the building there is a pulpit for the imām; in the direction in which Mecca lies (the *Qiblah*) there is a niche toward which the faithful look when they engage in prayer. Opposite the pulpit there is a platform surrounded by a parapet, with a desk on which is placed the Koran for the purpose of reading to the congregation. On Fridays the five daily prayers, obligatory on the faithful every day, are recited in the mosque by the whole congregation, together with additional prayers. It is not customary for women to enter the mosques, and when they do they are placed

separately from the males. The chief officer of the mosque is the *nadir*, under whom are two imáms, muezzins who call the people to prayer, etc. These in addition to their religious vocation generally pursue secular callings. It is usual to cover the floor of the mosque with carpets, but there are no seats. On entering a mosque, the faithful remove their shoes. The building is never closed; and while nothing could exceed the devotion of the congregation gathered together in worship, at other times the mosques serve as convenient meeting-places, and in which wayfarers may accommodate themselves. They also serve as schools and seats of learning. Thousands of students are regularly in attendance at the most famous of these, the Azhar Mosque in Cairo. The mosques are maintained for the most part by endowments in land. The finest of the mosques of Constantinople and of the world is that of Saint Sophia, at one time a Christian church. In addition to schools, the imperial mosques have frequently hospitals and kitchens for cooking food for the poor.

MOSQUERA Y ARBOLEDA, mōs-kā'rā ē ār-bō-lā-dā, Tomás Cipriano de, Colombian politician and President: b. Popayan, 20 Sept. 1798; d. Coconuco, 7 Oct. 1878. After three years of service in the patriot army he was captured by the Spaniards, when he was only 18, but he escaped at Jamaica, returned to the army and in 1829 was made general by Bolívar, who made him also envoy to Peru. After Bolívar's death Mosquera traveled in North America and Europe. He became a senator in 1833; was President of New Granada 1845-49; in 1859 led the federalist revolt against Ospina, adopted a federal constitution by which the name of the country was changed from New Granada to the United States of Colombia, and became dictator of the new federation. His power was checked by a revolt led by Canal, with whom Mosquera in 1862 came to terms. Under the constitution then adopted Mosquera was elected President in 1863 and in 1866; the latter term was cut short by a successful revolution due to the President's arbitrary use of power. He was banished to Lima for four years, but upon his return again entered politics, was governor of Cauca and became a member of Congress. He was strongly anti-clerical; and wrote on the geography of New Granada, and a valuable life of Bolívar (1853).

MOSQUITIA, mōs-kē-tē'ä. See MOSQUITO COAST.

MOSQUITO (diminutive of the Spanish *mosca*, a fly), a name applied to insects of the dipterous family *Culicida*. Mosquitoes are cosmopolitan, only a few oceanic islands, deserts and mountain tops being free from them. Frequently they occur in vast swarms, and they abound equally in arctic regions, as Alaska and Greenland, and in the tropical swamps of Africa and South America, while at many intermediate points they are intolerable pests. Vertically they range from the seashore to altitudes of at least 13,000 feet. While many species are local, others are very widely distributed. Typical mosquitoes have the following characteristics: The mouth is provided with a prolonged, suctorial, piercing proboscis; the greater part of the body and head and portions of the wings and legs are covered with scales

which determine the color pattern; the complicated venation of the wings is also highly characteristic. These features distinguish mosquitoes from the related midges (*Chironomida* and *Cecidomyiida*) and the black flies (*Simuliida*); and from the crane-flies (*Tipulida*) which inspire most of the stories of gigantic mosquitoes. Not less than 22 genera and 350 species are now known. The species are based largely upon differences in the form and arrangement of the scales and the resulting coloration, the form of the foot-claws, etc.

Development.—The typical life-history of a mosquito is as follows: The eggs are deposited at night in or (rarely) near shallow water, usually fresh but in the case of a few species brackish or salt. After one or a few days they hatch into legless, aquatic larvæ, popularly known from their activity as "wigglers." These have the mouth provided with small jaws for browsing at the bottom, and with brushes of hairs whose movements induce currents in the water and bring to the mouth floating particles or minute plants and animals which serve as food. The thorax is more or less swollen, and the abdomen slender and nine-jointed, with the last, or anal, segment bearing two pairs of leaf-like appendages and a more or less conspicuous fan of spreading hairs. On the dorsum of the eighth segment is a pair of spiracles, or breathing-pores, usually borne at the end of an elongated tube or siphon. By their active wiggling the larvæ come frequently to the surface and breathe, and then sink by gravity lazily to the bottom. After one or more weeks the larvæ molt finally and transform into pupæ, which have the head and thorax closely united, and the latter greatly enlarged, with the form of the future legs and wings apparent. At the tail end is a pair of fin-like expansions, while the respiratory organs, instead of being near the end of the abdomen, have the form of a pair of large mouthed tubes or funnels on the dorsum of the thorax. Like the larvæ the pupæ are active wigglers, but, unlike them, are buoyant and naturally float at the surface with the respiratory funnels uppermost and exposed. When alarmed they display much activity and wiggle violently toward the bottom. The imagoes escape from the pupal investments at the surface, and windrows of cast-off skins are thrown up at the water's edge. The males, which transform first, hover in little clouds and are sought by the females. In the males the antennæ are broad and feather-like, in the females slender and simply hairy. The duration of the period of aquatic life varies with the species and temperature; in our common *Culex pungens* it may be only 10 days, so that many generations may be produced during a favorable season. The winter may be passed in any stage from egg to adult, all of which are extremely resistant to cold, and the aquatic stages capable of withstanding repeated freezing and thawing. The hibernating imagoes, which are found in houses and other sheltered places, may become active on warm days and in the case of *Anopheles*, at least, are chiefly fertilized females. Mosquitoes have many natural enemies. The aquatic stages are preyed upon by carnivorous fishes, water-newts and leeches. Vast numbers of the flying insects are destroyed by night-hawks and bats, and during

the day they are pounced upon by dragon-flies, hornets and other carnivorous insects, and snapped up by swallows and swifts as they skim the grassy meadows. Of their parasites the recently discovered worm, *Agammomermis culicis*, is considered to exert an important checking influence in some years.

Mosquitoes are weak fliers and usually seek shelter when the wind blows, so that railroad trains, ships and wagons are far more effective than their own wings in accomplishing their dissemination.

Notwithstanding that the chief human interest in mosquitoes arises from their blood-sucking habits, yet the taste for blood is certainly an acquired one and a relatively unimportant factor in the lives of the majority of

ter mosquito, the *Anopheles*, or swamp mosquito, and the *Stegomyia*, or cistern mosquito.

Culex pungens prefers the gutter and may be likened to the sparrow among birds; it is noisy and numerous, and always hungry.

The male insect (Fig. 1) presents a rather bushy head-dress, by which it may be easily distinguished from the plainer but more dangerous female. Male mosquitoes are not blood-suckers, but vegetarians; for the reason that the male insect cannot pierce the skin and must, therefore, subsist on food more easily obtained.

The feeding organ of the mosquito, called the proboscis, is composed of seven parts (Fig. 2), which together form the organ by means of which the blood is reached and through which it is obtained.

In the male insect the stylet, or piercing instrument, is adherent to the neighboring parts and cannot move sufficiently to puncture the skin.

The female insect (Fig. 3) is plain as compared with the male. The palpi, those projections on either side of the central proboscis, are much shorter in the female; and the organs to the outer side, the antennæ, are not as beautifully plumed. The female of the *Culex* is very annoying, but is not known to transmit disease in this country, though it is suspected of conveying dengue fever. In eastern tropical countries a species of the *Culex* is connected with the disease known as elephantiasis.

The *Anopheles* is the spotted-winged swamp mosquito, responsible for malaria in the human. A peculiarity of this mosquito is its long, thin legs, and the dark spots on the wings are characteristic. The same general difference in the head-dress of the sexes obtains, save that the palpi are about equally long in both, as may be seen by comparing the pictures (Figs. 4 and 5)

mosquitoes. The normal food of both sexes of many species, and the only food of the males of nearly all, consists of the juices of flowers, fruits and other plant parts. In a few species a meal of blood by the female seems requisite to the maturation of the eggs, but this is decidedly exceptional. Most of the species are active chiefly at night, but a few, like *Stegomyia fasciata*, in which also both sexes bite, are most vicious during the early afternoon. The bites of all species are not equally irritating, probably the result of dissimilar qualities of the salivary secretion which is poured into the wound to facilitate the blood flow. Ammonia and glycerine allay the irritation. Besides the warm-blooded birds and mammals, mosquitoes attack fishes, frogs, turtles and even other insects.

Until within a few years mosquitoes were regarded merely as intensely annoying pests, but since the definite discovery of their relation to disease-transmission their momentous importance has been recognized. Besides several diseases of the lower animals three serious human maladies—malaria, yellow fever and elephantiasis—have been definitely traced to their agency, and they are suspected of others.

Kinds and Characteristics.—Within the limits of North America nine genera and upward of 30 species are known to occur.

Illustrations are here given of the three varieties which assume importance through their relations to the human race: the *Culex*, or gut-

The *Stegomyia* is for the South by far the most important mosquito; not because it is most numerous, but because it is the natural conveyer of yellow fever. It has been called

the tiger mosquito because of its striped appearance. It is a most beautifully marked mosquito and very dainty. It is essentially a domestic insect and is found only in inhabited localities. It is a day mosquito, and, resting on a dark background, such as a black coat or dress, presents a particularly striking appearance, the white bands on the legs and the peculiar marking of the back easily distinguishing it from any other (Figs. 6 and 6a).

The antennæ of all male mosquitoes are more hairy than those of the female. Some of these hairs respond to sound by a vibratory motion; they are, therefore, auditory. These

chitinous process situated near the breathing apertures along the sides of the insect and set in motion by respiration. This is the famous yellow fever mosquito, which has been the greatest and most persistent enemy the South has

FIG. 4.

FIG. 5.

are the ears of the insect and it is believed that the male flies to the female guided by her song, adjusting the direction of his flight by turning his head until both antennæ are equally af-

fect, costing many thousands of lives and many millions of dollars, but which is at last happily, conquered, if we but use the weapons that have been put in our hands by the patient searchers for truth in the field of science.

FIG. 7.

Mosquitoes cling to surfaces as a cat cling to the bark of a tree. A mosquito cannot rest on a perfectly smooth perpendicular surface:

fly can. A fly's foot is a sucker; a mosquito's foot is a claw (Fig. 7). Mosquitoes resting upon window panes would seem to deny this, but a window pane, very shortly after a thorough cleaning, may collect enough moisture and dust to form a film over the glass sufficient, though invisible, to afford a firm hold for the insect.

RESTING POSITION OF *ANOPHELES*,
and of *CULEX* and *STEGOMYIA*.

FIG. 8

The resting position of *Anopheles* is peculiar in that the head, body and tail present a straight line, at an angle with the resting surface, while in the *Culex* and *Stegomyia* the body is bent as you observe in Fig. 8.

The eggs of *C. pungens* (Fig. 9), the gutter mosquito, are cone-shaped and float on end, being glued together in large masses to maintain this position in the water. The number deposited by a single mosquito varies from

EGGS OF *CULEX*.
(PART OF LOG MASS IN WATER)

FIG. 9.

50 to 400, and they hatch in from one to three days, varying according to temperature and environment. When a sufficient time has elapsed to complete the hatching process, the larva (Fig. 10) or wiggler tail issues from the shell and begins to feed on the vegetable and animal matter contained in the water.

In its growth the larva sheds its skin several times before the pupal stage is reached—in

FIG. 10.

FIG. 11.

from 7 to 10 days. Mosquito wigglers get along apparently without air, when the surface of the water is covered with ice, and it is possible that they get air then, in the same way that fish do. This would account for their not being destroyed by surface freezing of the water. Entomologists must decide whether or not the larvae have gills or some organ analogous to the gills

of the fish. The wigglers of some mosquitoes may be frozen in ice and hibernate until liberated by warmer weather.

The pupal stage in mosquito life corresponds to that of the chrysalis in the transition of a caterpillar into a butterfly (Fig. 11). The pupa does not feed. In about two days it becomes an imago, which is the technical name for the completed insect whose life begins with the ovum or egg.

The shell of the pupa breaks at its highest point and the completed mosquito issues, being supported by the floating shell until its wings spread for flight (Fig. 12).

The kind of mosquito that issues from the shell of the pupa depends of course on the kind of egg which has been deposited and hatched in the water.

The life cycle of *Culex*, the gutter mosquito is from 10 to 15 days. Do not mistake the life

FIG. 12

FIG. 13.

cycle for the length of life; mosquitoes may live as adult insects for many months, and some females must hibernate through the winter to furnish eggs for the next summer's supply.

Eggs of *Anopheles* (Fig. 13), the swamp mosquito, are boat-shaped and float singly on the surface of stagnant pools. They are deposited in numbers between 40 and 100. The bottom of the floating egg is marked somewhat like mosquito netting, the pattern being raised. The

FIG. 14.

FIG. 15.

top of the egg is smooth, black in color and partly covered by a transparent membrane which stands out from the surface of the top and sides, permitting intervening spaces of air, which float the egg like a lifeboat. The egg hatches in from three to four days.

The larva of *Anopheles* (Fig. 14) may be readily distinguished by its position at the surface of the water, as well as by its general appearance, differing from that of either *Culex* or *Stegomyia*. You will observe that the neck of the *Anopheles* larva is very slender, and that the head is turned upon the body. This is because the *Anopheles* larva finds its food on the surface and gathers it by the constant motion of little broom-like processes projecting from the sides of the mouth, and furnished for this purpose.

The breathing tube, you will observe, projects from the back or upper surface of the larva, near the tail end. To get its mouth to the surface while maintaining its position for breathing, requires that the head should be turned half round on the body, an impossible position to any but the thin-necked *Anopheles* larva.

The larva becomes a pupa (Fig. 15) in about 12 days. In about five more days the pupa is a full-grown mosquito.

Eggs of *Stegomyia* (Fig. 16), the yellow fever mosquito, float singly upon the surface of the water and are deposited in numbers varying

FIG. 16

FIG. 17.

from 5 to 75. They hatch in from 10 hours to 3 days, according to climatic and other conditions. The shell is marked like mosquito netting, the white pattern being raised and somewhat similar to that of the *Anopheles* egg, and on the sides are air-chambers which float it.

The larva (Fig. 17) is very similar in appearance to that of the *Culex*, and its position in the water is also similar to *Culex* and unlike *Anopheles*.

In about six days the pupa (Fig. 18) develops and in a day or two the mosquito begins its flight.

The larvæ of all mosquitoes have a breathing-tube near the end of the tail and the pupæ have a pair of breathing-tubes projecting from the body near the head.

The insect, both in the larval and the pupal

FIG. 18.

stage, requires air, to obtain which the breathing-tubes at frequent intervals protrude from the water surface into the air above.

The life cycle of the different mosquitoes varies, as to duration of the formative periods, according to conditions favoring rapid development; and no hard and fast rules can be laid down as absolute in this regard. It may be said, however, that the cistern mosquito breeds, approximately, in one week, the gutter mosquito in two weeks and the swamp mosquito in three weeks.

Observe how both the larvæ and the pupæ rise to the surface to breathe. This necessity suggested that they could be destroyed by pouring oil on the water surfaces so as to cut off the air. It is estimated that about two

tablespoonsful of ordinary kerosene will spread and film the water surface of an average cistern, and the oil will positively not affect the taste or healthfulness of drinking-water. The placing of oil upon drinking-water for the destruction of mosquitoes is not a new idea, for it was suggested as early as 1812 and has been practised for many years.

HOW MOSQUITOES TRANSMIT DISEASE.

Mosquitoes and Malaria.—Malaria is one of the greatest scourges to which man is subject. Its cause is fully established to be a minute unicellular animal parasite or haemsporidium of the class *Sporozoa* (q.v.), living within the red blood-corpuscles and introduced by the bite of a mosquito. Each well-marked variety of malaria has its especial causal parasite, which passes through a complicated life cycle. (See MALARIA). The parasites enter the blood of the mosquito as minute slender sporozoites. When mature the sporozoites are freed into the body-cavity by the rupture of the wall of the sporocyst, when they migrate to the salivary glands, penetrate their walls and reach the proboscis through the salivary duct. When a mosquito harboring the parasites in this stage bites a susceptible human being, some of the spores pass into the blood with the saliva and induce an attack of malaria, mild or severe according to their number and other conditions. The malarial organism once introduced into the human system may continue to multiply indefinitely by the asexual method unless destroyed by drugs or some reaction of the organism, but that it can be transferred naturally to another person only through the intervention of a mosquito and the intervention of the sexual generation. Properly speaking man is the intermediate, the mosquito the final or definitive host, though the latter appears to suffer no ill consequences from the presence of the parasite. In pernicious tropical malaria, or æstivo-autumnal fever, the period for the complete development of the characteristic sporozoites (*Laverania malariae*) in the mosquito is seven or eight days, but owing to the vast number of parasites of different broods present in the blood and their overlapping stages of development the exact time of schizogony is doubtful. Tertian and quartan fevers, the two best differentiated types of mild or benignant malarial fevers, are caused by related parasites known respectively as *Plasmodium vivax* and *P. malariae*, which differ from *Laverania* chiefly in the replacement of the crescent stage by an immediately spherical gametocyte. Asexual sporulation recurs in the first form at intervals of 48 hours, and in the latter of 72 hours, corresponding with rhythm of the fever's paroxysms. Daily or other intermediate recurrences are due to double or triple infections, in which the different broods sporulate at alternate days or in other combinations.

It was not until 1880 that Laveran, a surgeon in the French army, discovered the *œmœbulæ* in the blood of malarial patients in Algiers; the development of the sexual generation in the mosquito and its relation to Laveran's parasite were traced by Ross in 1897-98 while to the Italian zoologist Grassi is due the first clear demonstration of the effectiveness of preventive measures directed at the mosquito.

Our scientific knowledge of the subject was almost entirely created within the five years subsequent to 1898, and workers in many countries are constantly adding details. That several species of *Anopheles*, and especially *A. maculipennis*, are the chief, and so far as known sole disseminators of all types of malarial fever, is absolutely and thoroughly demonstrated from every standpoint.

Mosquitoes and Yellow Fever.—In the case of yellow fever our knowledge is in a very different and less satisfactory state. The relation of mosquitoes to this disease was suspected by Dr. Finley as early as 1881, but his theory excited little interest until, upon the occupation of Cuba by the American navy, a Yellow Fever Commission of inquiry, headed by Major Reed, was appointed. By a series of very careful experiments it has been established that mosquitoes are agents in the dispersal of this disease, and at the same time the old view of infection by contact and the old practice of isolation and fumigation for prevention have been nearly repudiated. The particular species of mosquito which transmits yellow fever is *Stegomyia fasciata*, an especially fierce biter in the early afternoon, which is found in the tropical parts of both hemispheres, and in America as far north as Virginia.

The germs of the disease may be taken by the mosquito only during the first three or four days of the fever; after that time the blood of the patient cannot infect the mosquito. The germs require about 12 days to migrate from the stomach of the insect to the salivary glands, from which they may be injected through the mosquito's biting organ into the human blood stream. Mosquitos, after becoming infectious, are capable of inoculating the disease into the human at intervals of three days (period of feeding) for practically an indefinite time.

The adaptation of protective measures to this important discovery renders the prevention or suppression of an epidemic very simple, theoretically. Screening the patient from mosquitoes during the first four days of fever (before the diagnosis), or killing all mosquitoes in the room before the 12th day after their possible infection, will certainly prevent a second case.

Agency in Other Diseases.—Elephantiasis or filariasis, like malaria, results from the presence in the blood of an animal parasite, but one of a very different nature. The adult males and females of the *Filaria*, which is a slender nematode worm, live together in the subcutaneous lymph vessels and produce enormous numbers of living, minute embryos which swarm in the blood, usually passing into the superficial capillaries at night and retreating to the deeper vessels by day. This peculiarity first led Manson to suspect the mosquito as a means of distribution and as a result of his studies and those of Bancroft and others on the *Filaria* of man and the dog, it is now known that when infected blood is swallowed by *Culex-fatigans* and other mosquitoes the embryos pass through certain stages of development within the intestine and malpighian tubules and then migrate through the body-cavity and tissues to the proboscis, from which human infection occurs. About three weeks are required to complete the development within the mosquito, and a year before the worms become sexually mature in the final

host. Elephantiasis is a dreadful and prevalent disease in tropical countries, and is frequent in the Southern States, but rare in temperate climates.

The mosquito is suspected of being instrumental in the spread of leprosy and other diseases, and undoubtedly many important discoveries await the investigator in this field.

Restraining Local Pests of Mosquitoes.—The possibility of the control or complete extermination of mosquitoes has received serious attention from zoologists, physicians and sanitary engineers, and is encouraged by local and national governmental grants. Wherever the problems have been carefully considered, as in New Jersey, Long Island, the Connecticut coast and Winchester, Va., in this country, much has been already accomplished toward the mitigation of the pest. As to measures, the complete destruction of all breeding places by the draining of swamps, pools and ditches is the most effective and permanent. This must be supplemented by emptying or suitably protecting by screening against the access of gravid mosquitoes all artificial vessels, such as pails, rain barrels, cisterns, privies and drains, which contain standing water in which mosquitoes may breed. A most effective and simple measure for local application is to pour a small quantity of kerosene upon the surface of the water of possible breeding-places. This spreads as a delicate film which deters the larvæ and pupæ from coming to the surface to breathe, so that they quickly suffocate, and at the same time kills or drives off females which come to lay their eggs. The application should be repeated at intervals of two or three weeks. Small fishes and the other natural enemies named above may be introduced into breeding-places to good purpose. The usual methods of ridding houses of mosquitoes by fumigation with sulphur dioxide gas; of preventing their entrance by thorough screening; and of protecting the person by the application to the skin of oil of citronella and other substances have a certain protective value. The most approved application is a mixture of one ounce each of oil of citronella and spirits of camphor with half an ounce of oil of cedar. The effect will last longer if incorporated with vaseline. It has been shown by the experiments of Grassi and others that this method alone is sufficient to grant immunity from malaria to inhabitants even of such fever-scourged districts as the Campagna of Rome. For the medical treatment of malaria we have a powerful specific in quinine, which is most effective at the time of the paroxysms, when the sporulæ are free in the blood plasma and most susceptible to the action of the drug. See MALARIA.

MOSQUITO COAST or **MOSQUITIA**, mūs-kū'ti-ā, region, Central America, on Caribbean coast, in Colon Department of Honduras and Zelaya Department of Nicaragua, on the east coast. The demarcation line is a cause of dispute between the two Central American countries. About 40 miles wide, bounded by the San Juan River on the south and the Aguan River on the north, the region is largely undeveloped, inhabited mainly by Mosquito Indians, but it contains valuable hardwood, and some stockraising and growing of tropical fruits is carried on.

From 1655-1860 the coast was held by the British. In the 17th century buccaneers issued out from the coast to prey on Spanish shipping. In 1848 the British claimed San Juan del Norte, but the Clayton-Bulwer Treaty (1850, q.v.) checked any claim to Nicaraguan territory by either Great Britain or the United States. The British had also held a protectorate over the Mosquito Indians.

When the coast was ceded to the two countries in 1860, Nicaragua formed an Indian reserve, but after an insurrection in 1894, José Santos Zelaya incorporated the strip as Zelaya Department, and gave the Indians full citizenship rights.

MOSS, Frank, American lawyer: b. Cold Spring, N. Y., March 16, 1860; d. New York, N. Y., June 5, 1920. After studying at the College of the City of New York, Moss was admitted to the New York bar at the age of 21. The Society for the Prevention of Crime retained him as counsel in 1887, and made him a member of its executive board in 1892. He was chosen president of the board of police commissioners in 1897, and served as counsel of the Lexow Investigating Committee in 1897, and the Mazet Investigating Committee in 1899. As assistant district attorney (1909-1914) he was associated with the prosecution of Lieut. Charles Becker for the murder of gambler Herman Rosenthal. He was the author of *The American Metropolis*, 3 vols. (1897).

MOSS, John Calvin, American photoengraver: b. Washington County, Pa., Jan. 5, 1838; d. New York, N. Y., April 8, 1892. An early interest in daguerreotypes led Moss to experiment in engraving by means of photographs. With the help of his wife, Mary Bryant Moss, he established the Photoengraving Company in New York City in 1872, and when he achieved success, set up a larger company, the Moss Engraving Company. Here he trained engravers who became world-famous, and although his methods were later supplanted, he was the first successful commercial photoengraver.

MOSS PINK. See PHLOX.

MOSS TROOPERS, in English history, bands of Royalist supporters (also known as Tories), who, after the Ordinance of Union with

England was proclaimed in 1654, attacked Cromwell supporters all over the border between the two countries. They were finally reduced by George Monk (q.v.).

MOSSADEGH, mō-sā-dēg', **Mohammed**, Iranian statesman: b. Teheran, ?1880. After serving in the Iranian Finance Ministry from 1896 to 1906 he went to Paris to attend the École des Sciences Politiques, then studied law at the universities of Liège and Neuchâtel. Returning home, he became undersecretary of finance (1917); minister of justice (1920), and later the same year governor general of Farsistan. A member of the Majlis which elected Riza Pahlevi hereditary shah in 1925, he subsequently lost royal favor, and was twice imprisoned. Released in 1941, he was elected a deputy to the Majlis in 1944. After the assassination of Premier Ali Razmara in 1951 and resignation of his successor Hussein Ala, Mossadegh, leader of the National Front Party, became premier on April 29, 1951, the day after the Majlis unanimously adopted a bill nationalizing the country's oil resources and expropriating without compensation the Anglo-Iranian Oil Company properties. Operation of the vast oilfields and refineries came to a standstill. After protracted negotiations, a settlement failed. Mossadegh went to the United States to make a personal appeal for financial aid, but President Eisenhower rejected his request. Financial difficulties finally led to his downfall. In August 1953 the shah dismissed Mossadegh, naming Gen. Fazollah Zahedi as premier. When Mossadegh ignored the order, the shah left the country, and royalist troops led by Zahedi seized the power. Mossadegh was sent to prison, tried for treason, and sentenced to three years' imprisonment.

MOSSES, a class, Musci, together with the liverworts, Hepaticae, constituting the Bryophyta, one of the five large groups of land plants. Mosses are worldwide in distribution, and in general inhabit the less favorable areas of this earth. Thus *Andreaea* grows on exposed rocks from the Arctic to the Antarctic; in the tropics on high mountains. Other common rock-inhabiting forms are species of *Ulota*, *Orthotrichum*, *Grimmia* and *Hedwigia*. These, with the lichens, initiate succession on stones, and so prepare the way for other plants. In contrast are those mosses which live in the water of running streams, such as *Hygrohypnum dilatatum*, *Eurhynchium rusciforme*, and especially the conspicuous water mosses in the genus *Fontinalis*. The bog moss, *Sphagnum*, is the pioneer in acid bog succession, although it is often associated with other genera such as *Hypnum*. Still others flourish in swamps, like *Dichelyma* and the tree moss *Climacium*, which is suggestive of ground pine or a cedar tree in miniature. Many mosses, such as species of *Mnium*, form soft green carpets along the shaded banks of streams. Among the most attractive and showiest of all temperate representatives are the mountain fern moss, *Hylocomium splendens*, which forms spreading mats on rocks and decaying logs in mountainous areas and ravines, sometimes glistening in the mist of waterfalls; the common fern moss, *Thuidium delicatulum*, of rich woodlands, its finely branched stems suggestive of delicate fern leaves; and the plume moss, *Ptilium cristacastrensis*, of which the branches, covered with

minute, yellowish-green leaves, form feathery tufts in the cool, moist mountains of Europe, Asia, and North America. Wrapped around the bases of tree trunks the common *thelia*, *Thelia tortella*, is often seen. Some species of the conspicuous hair-cap moss, *Polytrichum*, grow in damp places, such as *P. commune*, which may be over a foot high; others, like *P. piliferum*, prefer sandy habitats. Both of these occur across the Northern Hemisphere, and they are abundant in the Southern as well. Nestled in the cracks of city streets, the gray-green plants of the cosmopolitan silvery bryum, *Bryum argenteum*, may occasionally be found. Some mosses characteristically form cushions or tufts, such as the white pin-cushion moss, *Leucobryum glaucum*, the widespread broom moss, *Dicranum scoparium*, and its smaller relative, *Dicranella heteromalla*; both of the latter have the leaves facing in one direction, as if brushed. *Nanomitrium*, with stems about one-tenth of a millimeter in height, and *Ephemerum*, about one millimeter high, grow in moist soil, clay and mud, and are among the smallest mosses. The twisted-stalk or cord moss, *Funaria hygrometrica*, and *Ceratodon purpureus*, both of wide distribution, grow on barred wood and bare soil, and then, like birds in passage, disappear when conditions change. Lastly there are *Splachnum*, found especially on the dung of cows, and the modest luminous moss, *Chistostegia pinnata*, which grows in dim caves in Europe and North America, and by focusing the light upon its chloroplasts, glows like emeralds in twilight. For structure and reproduction of mosses see also PLANTS AND PLANT SCIENCE (Classification).

EDWIN B. MATZKE.

MOSSES FROM AN OLD MANSE, title of Nathaniel Hawthorne's second collection of tales and sketches (1846). The Old Manse, Hawthorne's Concord home, is described in the opening chapter of the book. The remaining contents include many of Hawthorne's most famous short sketches, such as *The Birth-Mark*, *Roger Malin's Burial*, and *The Artist of the Beautiful*. These bear witness to his love of the mysterious and the unusual; and their action passes in a world of unreality, which the genius of the author makes more visible than the world of sense.

MOSSLEY, mōs'li, municipal borough, England, in Lancashire, on the Tame River and the Huddersfield Canal. It contains woolen factories, foundries and has among its public buildings a modern Gothic church and a handsome town hall. Pop. (1951) 10,415.

MOSSORO, mōō-sōō-rō', city, Brazil, in the state of Rio Grande do Norte, 150 miles west-northwest of Natal, on the Apodi River. It is a saltworking center, and a livestock and cotton market. Gypsum and marble quarries and manganese deposits are in the vicinity. Pop. (1950) 20,576.

MOST, mōst, **Johann Joseph**, German-American anarchist: b. Augsburg, Bavaria, Feb. 5, 1846; d. Cincinnati, Ohio, March 17, 1906. After working as a bookbinder, he became editor of the *Freie Presse* at Berlin, and in 1874-1878 was a member of the Reichstag for Chemnitz. Expelled from Germany, he went to London, where he founded *Die Freiheit*, an anarchist paper. In 1881

he was imprisoned for printing an article approving of the assassination of the Emperor Alexander II of Russia. Upon his release he came to the United States, and continued *Die Freiheit* in New York. In 1901 he was imprisoned for a seditious editorial on the assassination of President William McKinley.

MOST, mōst (Ger. BRUX), city, Czechoslovakia, Province of Bohemia, about 48 miles northwest of Prague, to which it pipes gas from its extensive lignite fields. It is important as a mining, metallurgical, and chemical center, manufactures porcelain, and is a rail junction.

In 1938 it was claimed by Germany as part of the Sudetenland, but after World War II it was returned to the Czechs. During the war the city was badly bombed because of the nearby synthetic fuel plant. Some of its ancient churches survived. Since 1948 its industries have been controlled by the Czechoslovak People's Republic. Pop. (1948) 35,330, including suburbs.

MOSTAGANEM, mōs-tā-gā-nēm', city, Algeria, in the Department of Oran, located on the Gulf of Arzew, and on a branch of the Oran-Algiers Railway. It is situated on a steep cliff 280 feet above the Mediterranean Sea and has a deep-water harbor. The city exports wine, wool, cattle, grain, and figs. It was built on the ruins of an important city of the old Roman period and flourished in the 16th century under the Berbers, but lost its importance until the French in 1833 captured the site and built up its industries. Pop. (1948) 50,403.

MOSTAR, mō'stār, city, Bosnia and Herzegovina, Yugoslavia, former capital of Herzegovina, picturesquely situated along the cliffs in the narrow valley of the Neretva River. It is connected by rail with Sarajevo. Its industries are coal mining, aluminum and tobacco manufacture, and wine culture. It is the seat of a Roman Catholic and a Greek Orthodox bishop. Pop. (1953) 31,608.

MOSUL, mō-sōol', city, Iraq, capital of a province of the same name, on the west bank of the Tigris River, 220 miles north-northwest of Baghdad, and on the railroad connecting Baghdad with Syria and Turkey. Across the river is the site of ancient Nineveh, and 16 miles away is Tepe Gawra, the site of other important archaeological finds.

Mosul is an ancient Arabic town, captured by the Moslems in 636 and annexed to the Ottoman Empire in 1638. It was a place of great commercial importance on the caravan route from Persia and a cotton manufacturing center; muslim cloth was named after it. After the breakup of the Ottoman Empire, it was awarded to Iraq by the League of Nations in 1925, and has come into prominence again as a center of the oil industry in Iraq. Pop. (1947) city, 203,273; province, 601,589.

MOSZKOWSKI, mōsh-kōf'skē, **Moritz**, Polish composer and pianist: b. Breslau, Germany, Aug. 23, 1854; d. Paris, France, March 9, 1925. After studying at Dresden and Berlin, he began to appear in public at the age of 19, and his success was immediate. He was a talented composer as well as performer; his opera *Boabdil* was presented at Berlin in

1892; his other works include a ballet, *Laurin*; a symphonic poem, *Jeanne d'Arc*; some *Dances espagnoles* for the piano or violin; and the two orchestral series called *Les Nations*.

MOTA-PADILLA, mō'tā pā-dēl'yā, Matias de la, Mexican historian: b. Guadalajara, Mexico, 1688; d. 1766. He was a lawyer, and during the latter part of his life a priest. He wrote, among other works, *History of the Conquest of New Galicia* (1870-71).

MOTET, or **MOTETT**, a vocal composition in harmony, set to words generally selected from sacred writings. Like the madrigal, the motet was at first set to words of a pious character, and there are ecclesiastical decrees extant forbidding its use in church.

MOTH, an insect of the order Lepidoptera, in which the wings (and usually other parts of the body) are mostly clothed with scales, which provide the various color patterns. In butterflies, the antennae (feelers) are usually conspicuously enlarged toward the end, and are therefore "clubbed." In moths, the antennae are of varied form, but usually tapering, very rarely swollen toward the tip, frequently feathered or pectinate. When at rest, most moths hold the wings roof-like over the abdomen, but many kinds have folding wings; a few hold them at right angles to the body, while butterflies "sleep" with their wings held closely together over the abdomen. The skippers (butterflies) have the habit of drooping the hind wings while the front wings are parallel or close together. The color of the scales in butterflies is mostly due to the refraction of light, whereas in moths it is mostly owing to pigment; for this reason, the colors of moths fade much more rapidly when they are exposed to light. Another difference lies in the fact that almost all butterflies are diurnal, while the vast majority of moths are nocturnal. Those that fly in the daytime are usually brightly colored, but a small number are dull and unattractive.

Size.—Moths vary in size from tiny nepticulids, with a wing expanse little over one-eighth of an inch, to the giant Atlas moth, in some forms of which the expanse exceeds 10 inches. The majority of moths are small, with a wing expanse of less than one and one-half inches, but it is the larger ones that engage our attention. Most moths are attracted to light, and many of these seem to be dazed by it and fly around aimlessly. This is particularly true of the noctuids or cutworm moths, and has earned for them the name "millers." However, the term is applied to other moths of similar size and habits.

Eggs.—Eggs of moths are generally more or less spherical or oval but there still is great diversity of form: many kinds are flattened on one end and there may be depressions, rings, or tubercles. The eggs may be laid singly, in rough masses or in a regular pattern, and they may have only the protection offered by the shell itself; or they may be covered with a coating secreted by the mother. Sometimes this coating, as in the case of the white marked tussock moth, may consist of a white froth, while, in the well-marked tussock moth, it is composed of hairs held in place by body secretions. The adults of the tent caterpillars lay their eggs about small twigs and cover them with a shellac-like sub-

stance to protect them during the winter. Most moths deposit their eggs on the plant upon which the larvae (caterpillars) are to feed, but there are some, such as the gypsy moth (q.v.) that lay them in masses without apparent consideration for the welfare of their offspring: in stone walls, tin cans, or under projecting objects; in fact, anywhere that the moth may find herself at the time that the egg-laying urge comes upon her. Moths with such habits are usually very prolific, and the fact that such insects are successful in their struggle for existence is well exemplified by the destructiveness of this moth in American forests, where natural enemies are few in number. The females of the Psychidae (bagworms) are wingless and never leave the case which they build when young and enlarge as they grow. The males mate with the imprisoned female, the eggs are laid, and she shrivels and dies. The newly hatched larvae leave the case and go in search of food, building a case soon after birth.

Larvae.—The larvae, or caterpillars, of moths all conform to the same general pattern, yet they may be greatly modified to fit the varied conditions under which they live. All caterpillars have three pairs of true legs situated on the thorax (the first three segments behind the head), and in general, most of them possess five pairs of prolegs, or stump legs. The three pairs of legs are used both for locomotion and for holding the food and directing it to the mouth: the prolegs are used for locomotion and holding the body in position while the caterpillar eats or rests, or resists attempts of enemies to dislodge it. The number of prolegs may be reduced. In some forms, there are four, three, or two pairs, the more anterior pairs being absent. In the geometrids, or measuring worms, only the two posterior pairs remain, and the caterpillar moves about with a deliberate, hunching motion in which the rear part of the body is carried forward until it almost meets the anchored true legs, then the body is stretched forward to full length, and the process repeated. Because of this habit, the caterpillars are called measuring worms, or inch worms, and many people believe that these caterpillars are just an inch in length. Other caterpillars have acquired rather similar habits, but none of them have developed to quite the stage of perfection attained by the geometrid larvae. Some noctuid larvae are loopers, the most notable being the cabbage looper, a serious pest of that plant.

The larvae of moths have developed various means of protection against their innumerable enemies. Some geometrid larvae cover themselves with bits of leaves, while others attach themselves to twigs or leaves with their prolegs and maintain a rigid position, themselves resembling tiny twigs. They also have the habit of dropping on a silken thread when suddenly disturbed, climbing back to the food plant when the danger is past. Others build communal silken tents in which they rest, coming out to feed, while other kinds feed within the nest, enlarging it as the food supply dwindles. Some cutworms hide in the soil during the day and feed at night. Other caterpillars conceal themselves in the crevices of bark or under debris, while still others, like the horned devil, are provided with horns or projections of various types. They may also resemble bird droppings, or have markings of a nature that blend with the background on which they live. Some hawk moth larvae have mark-

(4) *Malacosoma americana*, the tent-caterpillar moth. (5) *Ampeloeca versicolor*, a hawk moth. (6) *Utetheisa bella*, the bella moth. (7) *Feralia jocosa*, a noctuid or owl moth. (8) *Automeris io*, the io moth. (9) *Euclea chloris*, a slug caterpillar moth. (10) *Gonodonta nutrix*, a noctuid or owl moth. (11) *Catocala cara*, red underwing moth. (12) *Brephos infans*, the infant, one of the geometridae or measuring worms.

MOTHS

1. Typical clothes moth of the family Tineidae, female and eggs. 2. Cecrop moth, *Samia cecropia*, an American silkworm moth. 3. The *Rhyecyntis*, a large tropical American silkworm moth of the family Saturniidae. 4. The *Heliconia*, tropical American moth of the family Saturniidae. Note the transparency of the wings. 5. Imperial moth, *Basilodes imperialis*, a large brown and yellow American species. 6. The long-tail Copiopteryx moth, of the family Saturniidae, found in tropical America. 7. Prometheus moth, *Callosamia promethea*, a large brown-winged American silkworm moth and its cocoon. 8. The hickory tiger moth, *Halisidota caryocoryctes*, resting (top) and in flight (bottom).

Illustrations are numbered from 1 to 8, top to bottom.

ings in front so that they resemble the head of a snake when they assume a certain position. Many others are clothed with poisonous spines or barbed, poisonous hairs. The leaf rollers form cylinders in which to live, while the case-bearers and bagworms build protective coverings. Others mine in leaves or bore into plants.

Pupae.—The pupae are cylindrical, elongate, rounded in front and tapering behind, and show few conspicuous modifications. The pupa may be naked, in a cell in the soil, or may be enclosed in a silken cocoon. The cocoon may be flimsy or of great strength; sometimes it consists of the caterpillar's hairs, held together by silken strands or particles of leaves or debris. In the case of leaf rollers, more silken strands are added to hold the pupa in the rolled leaf. Most pupae are incapable of locomotion, but those of borers (for example, aegeriids and cossids, etc.) work their way to the exit and project from it, as do those of many others that live in concealed places.

Flight.—There is a great difference in the flight of adult moths. The hawk moths are streamlined and very fast flyers, being able to hover in front of flowers while they feed upon the nectar, and they are able to move backwards. The noctuids are practically all strong flyers, but most of the large moths (*Cecropia*, *Polyphemus*) and many smaller ones have an undulating flight; the hepialids are very poor flyers. While the females of many moths are wingless, and can only crawl from place to place, the females of some others (for example, the silkworm and the gypsy moth) have wings but are unable to fly.

Beneficial and Injurious Moths.—Many moths are serious pests, but there are a few that are beneficial. The best known of these is the silkworm, *Bombyx mori*, the chief source of commercial silk. Some of its relatives also produce silk, but it is of poorer quality, as is the silk of the Saturniidae. The larvae of some moths are used as food by primitive peoples, and the larvae of the pandora moth, *Coloradia pandora*, a saturniid, feeding on pine in our western mountains, were an important article of diet to Indians of the region. Man has, in a few instances, been able to utilize moths in the destruction of pest plants, a fine example being the introduction of *Cactoblastis cactorum*, into Australia for the control of *Opuntia* cactus. A similar effort in South Africa has proved less successful because some native parasites destroy the larvae. And in the destruction of weeds and unwanted plants, the larvae of many moths are of considerable value.

It is impossible to mention more than a few of the more important pests. Among these are the cigar case-bearer, and the pistol case-bearer, members of the family Coleophoridae, and the leaf miners of the families Gracilariidae and Lyonetiidae, the adults being very small moths. The Tineidae contains the clothes moths, which are so destructive to articles made from wool, fur, and other animal matter. The clearwing moths (*Aegeriidae*) are all borers in herbaceous and woody plants; the peach borer, currant borer, and squash borer do enormous damage. The Gelechiidae contain such serious pests as the Angoumois grain moth, the peach twig borer, the potato-tuber moth, and the pink bollworm, a pest of cotton in most places where it is grown. The Oriental peach moth, the pea moth, straw-

berry leaf folder, grape-berry moth, bud moth, the spruce budworm, fruit-tree leaf roller, and the orange tortrix are members of the Tortricidae (including the Olethreutidae). Many of our most serious agricultural pests belong to the family Pyralidae, now divided into eight families or subfamilies. Some of these are: the European corn borer, the melon worm, the celery leaf-tier, the meal moth, which feeds on damaged cereals and other seeds; the Oriental rice borer and the sugarcane borer. The larvae of the wax moth and lesser wax moth feed on wax, even in hives containing bees, and often cause serious damage. The worst pests of such things as cereals, flour, nuts, dried fruits, are the Indian-meal moth (*Plodia interpunctella*) and the several species of *Ephestia*, including the Mediterranean flour moth. The best known of the slug moths are the saddleback caterpillar (*Sibine stimulea*), the larvae of which possess stinging hairs. The Noctuidae contain the cutworms and armyworms, as well as many other pests; many of the tiger moths (*Arctiidae*) are pests of cultivated crops and trees, many being general feeders. The species of *Datana* of the family Notodontidae, and several relatives, are gregarious and frequently injurious; the Lymantriidae contain such injurious forms as the gypsy moth, brown-tail moth, satin moth, and the tussock moths. Several of the Sphingidae (hawk moths) are injurious, the chief offenders being the tomato and tobacco hawk moths, and several species feeding on grapes and apples. The tent caterpillars, of the genus *Malacosoma*, are often destructive to orchard and forest trees in America, while the lackey moth is destructive in Europe; also members of the same family (*Lasiocampidae*) are the Syrian silkworm and the bibindandy of Madagascar, both important in the silk industry in the regions in which they occur. The io moth (*Automeris io*) is the only giant silkworm in North America that is rather consistently a pest: this occurs chiefly when it feeds on corn, and its stinging spines cause irritation and a nettlelike rash; The *Cecropia* and *Promethea* rarely cause serious defoliation of trees or shrubs. See also separate articles on the various families, individual moths, and pests.

Bibliography.—The literature is very extensive, but there is no complete work on the various faunae. Buckler, W., *The Larvae of British Butterflies and Moths*, vols. 1-9 (London 1886-1901); Busck, A., "A Revision of the American Moths of the Family Gelechiidae," *Proceedings, U.S. National Museum* (Washington 1903); Seitz, A., *Macrolepidoptera of the World*, vol. 1, far from complete, deals with several American families (Stuttgart 1906-); Holland, W. G., *The Moth Book* (New York 1913); Hampson, C. F., *Catalogue of the Lepidoptera Phalaenae in the British Museum*, 12 vols. (London 1898-1920); Barnes, W., and McDunnough, J., *Contributions to the Natural History of the Lepidoptera of North America*, 4 vols. (Decatur, Ill., 1911-21); Forbes, W. T. M., "The Lepidoptera of New York and Neighboring States," *Cornell Univ. Mem.* (Ithaca 1923); Heinrich, C., *Revision of the Olethreutidae*, U.S. National Museum Bulletin Nos. 123 and 132 (Washington 1923, 1926).

The following general works contain sections on moths, dealing with structure and classification: Imms, A. D., *A General Textbook of Entomology* (New York 1934); Comstock, J. H.,

An Introduction to Entomology (Ithaca 1940); Essig, E. O., *College Entomology* (New York 1942); Herms, W. B., *Medical Entomology* (New York 1943); Matheson, R., *Entomology for Introductory Courses* (Ithaca 1944).

The following are catalogues and lists: Dyar, H. G., *List of North American Lepidoptera*, Smithsonian Institution Bulletin No. 52 (Washington 1902); McDunnough, J. H., *Check List of the Lepidoptera of Canada and the United States*, parts 1 and 2 (Los Angeles Museum 1938-39); Junk, *Catalogue of Lepidoptera*, incomplete, published in parts.

CHARLES HOWARD CURRAN, Associate Curator, Department of Insects and Spiders, American Museum of Natural History.

MOTH, Brown-tail (*Nygma phaeorrhoea*), probably introduced from Europe on nursery stock in the early 1890's, and first discovered in New England in 1897. It has been frequently intercepted on nursery stock since that time, and became established in various sections of New England and the Maritime provinces of Canada. Spraying with arsenicals and the systematic destruction of the "nests" in which the larvae spend the winter, has very greatly reduced its numbers or exterminated it. The adult is pure white with a wing expanse of about 1½ inches, and the broad tip of the abdomen golden brown. Both the adults and larvae are of medical importance because the bodies of both bear minute, barbed poisonous hairs which cause urticaria (brown-tail rash) when they come in contact with the skin. When the moths are numerous, the air-borne hairs cause internal irritation when inhaled. Some related moths are the tussock moths, the gypsy moth (*Liparis dispar*), and the satin moth (*Stilpnotia salicis*), the latter two also of European origin.

MOTH, Gypsy, or Gipsy. See GIPSY-MOTH.

MOTH, Leopard. See LEOPARD MOTH.

MOTHER ANN. See SHAKERS.

MOTHER CAREY'S CHICKEN, any of several small oceanic petrels (q.v.); specifically, in the Mediterranean and Atlantic, the storm-petrel (*Procellaria pelagica*) often seen about ships, especially in wild weather, and looked upon with superstitious dread by sailors. Its manner of paddling along the surface of the waves suggested the name petrel, namely, little Peter (the Apostle), afterward transferred to the whole group; and the "Mother Carey" is supposed to be a queer Anglicization of the Latin *Mater Cara* ("Dear Mother," an appellation of the Virgin). These little petrels are about six inches long, sooty black, with white rumps and a little white on the wings. They breed numerously on all northern coasts, as about Newfoundland, Labrador, North Greenland and the British Isles, wherever suitable places can be found, occupying holes in the face of earth banks, like bank-swallows, and rarely approaching or leaving their nests, each with a single white egg, except at night.

MOTHER OF CITIES, the euphemistic local title for Balkh (q.v.), central Asia.

MOTHER GOOSE'S MELODIES, the well-known collection of nursery rhymes. In

1860 a story was started to the effect that Mother Goose was a Boston woman; and she was identified as Elizabeth Goose, widow of Isaac Ver-goose, or Goose, and mother-in-law of Thomas Fleet, a Boston printer, who issued a collection of the *Melodies* in 1719. It is now conceded that *Mother Goose* belongs to French folklore and not to English tradition. Charles Perrault (q.v.), b. Paris, 1628, was the first person to collect, reduce to writing and publish the *Contes de Ma Mère l'Oye*, or *Tales of Mother Goose*, though he did not originate the name; and there is no reason to think that "Mother Goose" was a term ever used in English literature until it was translated from the French equivalent, "Mère l'Oye."

MOTHER-OF-PEARL. Inner coating of shells of many bivalve mollusks, including pearl oysters. It possesses some resemblance to pearls, and has much the same composition. On account of its beautiful iridescence and high polish, mother-of-pearl is largely used in thin sheets to decorate articles of ornament and minor pieces of jewelry. See PEARL.

MOTHER OF PRESIDENTS, in American history, a name given to Virginia because that state has given eight chief executives to the Union, namely: Washington, Jefferson, Madison, Monroe, Harrison, Taylor, Tyler and Wilson.

MOTHER OF STATES. In American history, a name given to Virginia on three counts. First, and most commonly accepted, from the fact that out of the original colony of Virginia as admitted to the Union, there were formed eight other states, Illinois, Indiana, Kentucky, Michigan, Minnesota, Ohio, West Virginia and Wisconsin; second, from Virginia's being the eldest of the 13 colonies; and, third, the early use of the name "Virginia" as embracing England's American territory from Spain's holdings in the south, to those of France in the north, thus making the colony the mother of all the states of the original union, as well as the eight new states already named.

MOTHER'S DAY. The honor of the origination of Mother's Day belongs to Miss Anna Jarvis of Philadelphia. Her mother died in 1906. On Sunday, May 9, 1907, she told a friend whom she had invited to remember with her the anniversary of the death of her mother of her desire to dedicate a day to all mothers. Before the next anniversary came she had interested many individuals and organizations in the observance of the second Sunday in May as Mother's Day. As a result of her efforts, Philadelphia observed the day, May 10, 1908. Miss Jarvis then became the missionary of the idea. She wrote thousands of letters to influential men in all walks of life. She interviewed many public men and pleaded for the observance of the day. Since 1912 the governor of Texas has observed the day by pardoning a number of prisoners on that day. State after state has adopted its observance. In May 1913 Pennsylvania made it a state holiday. On May 10, 1913 a resolution passed the Senate and the House of Representatives to make the second Sunday in May a national holiday, "dedicated to the memory of the best mother in the world, your mother."

Miss Jarvis has been the means of organizing a national and an international organization to further the promotion of the observance of the day. It began to be observed in England as early as 1913. The second Sunday in May is observed in all churches irrespective of creed, and the previous Friday is observed in all the public schools. The previous day is observed in business establishments. It is observed through some distinct act of kindness, visit, letter, gift, or tribute to show remembrance of the mother to whom general affection is due." For a time it was observed as Father's Day, "designed to perpetuate all family ties." Its slogan is in honor of "the best mother who ever lived." The badge of the day is a white carnation.

MOTHERWELL, mut'h'er-wél, William, Scottish poet and antiquary: b. Glasgow, 13 Oct. 1797; d. there, 1 Nov. 1835. Educated at Edinburgh and Paisley, at 15 he was apprenticed to the sheriff-clerk of the latter town, and in 1819-29 was sheriff-clerk depute. It was while in this situation that he did his best work both as poet and ballad-collector. He was precocious, and planned his ballad, 'Jeanie Morrison,' at the age of 13. After editing the collection of songs called the 'Harp of Renfrewshire' (1819), he compiled the more important collection of ballads published in 1827, under the title of 'Minstrelsy: Ancient and Modern,' with a historical introduction and notes. This brought him to the notice of Scott. He became editor first of the Paisley *Advertiser* (1828-30) and then (1830) of the Glasgow *Courier*. He published in 1832 original 'Poems: Narrative and Lyrical.' In 1835 he collaborated with Hogg in an edition of Burns. In the same year he was summoned to London to give information to a special Parliamentary committee; here his health broke down and he died not long after. Some of his lyrics are familiar in anthologies.

MOTHERWELL, Scotland, a police and municipal burgh and manufacturing town in the county of Lanark, 12 miles southeast of Glasgow. It is of comparatively recent origin, and takes its name from three farms called High, Low and North Motherwell, which again derived their names from an adjoining spring, which in Roman Catholic times was dedicated to the Virgin Mary, and called the *Well of our Lady*, or *Mother's Well*. The inhabitants are chiefly employed in the neighboring coal-mines, iron and steel works, foundries and engineering shops. Motherwell has several churches, a town-hall, public park, good water supply, electric light, etc. Pop. 68,869.

MOTHERWORT, a labiate plant (*Leonurus cardiaca*) with rigid branched stem about three feet high, flowers in crowded axillary whorls, white with a reddish tinge, upper lip of corolla shaggy, calyx with spreading teeth; leaves with long petioles, lower ones palmately cleft, upper ones three-lobed. The plant, with two or three related species, frequents waste places, and is not uncommon in North America, where it has been introduced from Europe. An infusion of it was formerly much employed in chest diseases.

MOTIF, mō-tēf. See LEITMOTIV.

MOTION. See MECHANICS.

MOTION (from the Latin *motio* and the verb *movere*, to move). In legal practice it means an application to a court by one party in a cause, or his counsel, seeking a rule he considers necessary in the case or to obtain relief in summary manner from an injustice. This may be made in a written application or orally. In cases where the object of the motion may be granted on request and without a hearing it is a motion *of course*, such as an *ex parte* application; if notice is required for other party it is a motion *on notice*. A motion made on matter of fact has to be supported by an affidavit that such facts are true. There are also motions *for decree* and *for judgment*, etc. See DECREE; JUDGMENT.

MOTION, in music, is a term used to express a change of pitch in successive sounds, when they are allotted to a single part or voice, or to groups of parts or voices which sound simultaneously. In a single part the motions are classified according to whether the successive steps do or do not exceed the limits of a degree of the scale at a time; in the former case it is called "disjunct" and in the latter "conjunct" motion. When motions of different parts sounding together are independent it constitutes counterpoint, in which cases, according to their relations, we get "contrary," "similar" and "oblique" motions. "Contrary" motions have their parts converge or diverge, one rising as the other falls. "Similar" motions either rise or fall together; while the "oblique" defines one part only moving up or down, the other standing still.

MOTION PICTURES. See MOVING PICTURES.

MOTION PICTURES, Censorship of. See MOVING PICTURES, Page 540, Col. 2.

MOTLEY, mōt'li, John Lothrop, American historian: b. Dorchester, Mass., 15 April 1814; d. near Dorchester, England, 29 May 1877. His education was obtained at Harvard, from which he was graduated in 1831, and at the universities of Berlin and Göttingen, between which he divided two years (1832-33). His first published writings were contributions to Willis' *American Monthly Magazine* and "verses in the corner of a paper called the *Anti-Masonic Mirror*." His first book, the two-volume, semi-autobiographical 'Morton's Hope' (1839), met with a generally unsatisfactory reception; and, according to Holmes, the *North American Review* "dropped a small-print extinguisher upon it." He went to Saint Petersburg in the autumn of 1841 as secretary to the American legation, but after a brief residence returned (1842). His first important attempt in history was a 50-page article, nominally a review but really a narrative, on Peter the Great, in the *North American* for October 1845 (in book-form in the 'Half-Hour' library). His further literary work during this period includes notable essays on Balzac (July 1847) and the 'Policy of the Puritans' (October 1849) in the *North American*; and a second effort of fiction, 'Merry Mount' (1849), certainly an advance on the first, and rewarded by a nearly 20-page notice in the *North American*, but clearly not a success. But so early as 1846 he had been gathering material for a history of Holland. Having learned that Prescott, then at the height of his reputation, was busy upon the 'History

of Philip II,¹ Motley had a conference with Prescott, who urged him to continue, even though the two works would unavoidably cover the same ground. For the year 1849 he was a member of the Massachusetts house of representatives; and he often humorously referred to his experience when an extensive and, as he fancied, impregnable report prepared by him as chairman of the committee on education was triumphantly demolished by George S. Boutwell (q.v.), then a young representative from Groton. From 1851 until 1856, the year of the appearance of the 'Rise of the Dutch Republic,' he was in Europe, continuing his investigations at Berlin, Dresden, The Hague and Brussels. When, after 10 years' labor, the great work was at last ready for the press, it had to be published at the author's expense. It was received with almost universal praise by public and critics—Froude writing, "one of the earliest as well as one of the most important recognitions"—and definitely established Motley's fame. It was widely translated, Guizot superintending the French version and writing the introduction. Motley was in America in 1856–58, but then returned to Europe. In 1861 he wrote two letters, then of great timeliness and importance, to the London *Times*, setting forth to the English nation the structure of the United States government, the causes of the Civil War and the results involved. From 1861 until his resignation in 1867 he was United States Minister to Austria, and his official dispatches in this post were highly praised by John Jay, his successor. He returned to the United States in 1868, in 1869 was appointed Minister to England by Grant, but in 1870 was suddenly recalled. This action by the government was never explained with any degree of satisfaction. The correspondence between Motley and Fish, Secretary of State, is to be found in a publication of the State Department (1871). It would appear that Holmes' verdict that Motley was greatly wronged is the correct one. Sumner said: "How little Mr. Motley merited anything but respect and courtesy from the secretary is attested by all who know his eminent position in London and the service he rendered to his country." Motley continued writing until 1873, and in 1875 paid a visit to the United States. His other two famous works are the 'History of the United Netherlands, from the Death of William the Silent to the Twelve Years' Truce, 1609' (1860) and 'The Life and Death of John of Barneveld, Advocate of Holland: with a View of the Primary Causes of the Thirty Years' War' (1874). They confirmed his rank as a great historian; some of the best Dutch critics thought the 'Barneveld' his chief publication. His style is precise and brilliant; his narratives are full of movement, his portraits vivid. Consult Holmes, O. W., 'John Lothrop Motley: A Memoir' (Boston 1898); Bassett, J. S., 'The Middle Group of American Historians' (New York 1916); Curtis, G. W. (ed.), 'Correspondence of John Lothrop Motley' (New York 1889); Mrs. S. St. J. Mildmay (Motley's daughter), 'John Lothrop Motley and his Family: Further Letters and Records' (New York 1910).

MOTMOT, a bird of the tropical American family *Momotidae*, allied to the kingfishers and todies, of which about 20 species are known, all

in the genus *Momotus*. They inhabit the forests, as a rule, and are usually solitary in the daytime, perching with the head drawn between the shoulders, solemn and still except for an occasional melancholy croak from the repetition of which they derive their name, originally French and pronounced *mo-mo*. They are most lively at early morning and in the dusk of evening, pursuing insects in short flights; they also eat fruits, lizards and snakes, which are tossed into the air from the point of the bill and swallowed; they sometimes devour the eggs of other birds. The nest is made in holes of trees or banks of earth. The motmots are birds of brilliant plumage, with one striking peculiarity. The two middle feathers of the long-tail are much prolonged and are always more or less denuded of vanes on both sides of the shaft except near the tip, giving a racket-like shape to the feathers. This seems to be the result of a habit in the bird of gnawing its feathers, which begins as soon as their growth outreaches the other rectrices. The best-known species is the Brazilian motmot (*M. brasiliensis*), about the size of a blackbird, of a deep rich green color, with bluish forehead, violet back of head and black crown. One of the Mexican species (*M. carolinensis*) occasionally crosses the line into the United States. Consult Belt, 'Naturalist in Nicaragua' (London 1888) and *Zoologica* (Vol. I, No. 5, New York 1910).

MOTOR, a machine for utilizing some power, as gas expansion or an electric current, to do useful work. The meaning of the word "motor" is similar to the commonest meaning of "engine," but the application of the words is different. We have become habituated to reserve the word engine for a steam-engine or large stationary gas-engine. The word motor came into common use with the commercial development of electricity. The makers of the first electric machine that was marketed for delivering power chose to call it an electric motor, and since then a reversed dynamo has always been a motor. Then came Daimler's perfecting of the "petrol" engine, for use on bicycles, which is now technically called an internal combustion engine, but popularly called a motor. The developments of this are the automobile motor, the aviation motor, Liberty motor, etc. Motor is now being used as a verb, as "to motor into town." It has become fixed in the language.

MOTOR AREAS, those portions of the brain in which are located the cells that govern the voluntary muscles of the body. The motor areas are confined more distinctly to the cortex or outer surface of the brain on either side of the fissure of Rolando, making up the areas known as the anterior central and posterior central convolutions. In these areas are numerous motor cells, the stimulating of which results in bodily motion. From these motor cells the impulse passes inward through the substance of the brain. The motor cells may be isolated from adjoining surface area by excision, with no effect on the control of the specific motion. When these surface areas are removed or injured there follows an impaired function of the muscle corresponding to the cells or the fibres interfered with. The motor area in the right side of the brain controls the

voluntary muscles of the left side of the body and the right hand and leg are controlled by the left side of the brain. The tracts of fibres that come from one side pass the middle line at the lower level of the medulla, the decussation of the pyramids. The motor area itself is subdivided into irregular areas or centres as they are loosely called—an arm-centre, a leg-centre, etc. In these more or less clearly delimited areas the cells governing the voluntary muscles of a leg or an arm are grouped. In much the same manner the nerves of the muscles of the face and of the eyes, tongue, etc., have their locations of origin in certain portions of this general motor area. There is, however, no evident relation between the size of a cortical area and the size of the mass of muscle which is controlled thereby. Thus the cortical area for the face and head is much larger than for the leg area which controls the many times greater bulk of the leg muscles. Irritation of the motor area usually causes excessive muscular movements or convulsions and destruction results in loss of motor power or paralysis. The experiments from which these facts are drawn were performed upon rabbits, dogs and monkeys. Some few of them have been confirmed in the course of surgical practice upon human patients. (See BRAIN; CONVULSIONS; PARALYSIS). Consult Howell, W. H., 'American Text-Book of Physiology' (Philadelphia 1903).

MOTOR BOATS, power boats equipped with internal-combustion engines, as distinguished from boats propelled by steam power. They divide into several groups or types: (1)

or sets of engines varying from 50 to 300 or more horse power.

The hulls are built in several styles—round-bottom, flat-bottom, V-bottom, tunnel-bottom, etc., and with widely varying types of bow and stern. Of the former, the prevailing types are the straight, round, dory, spoon and clipper bows; of the latter, the square, round, transom, fantail and torpedo sterns. A straight bow has the most elegant appearance, but a round bow rides better and is preferable. A transom or V-shaped stern makes the fastest and driest boat. Open boats of the launch class have a few feet of deck forward and aft, with a narrow strip along the gunwales, and a five or six-inch coaming around the cockpit. They are often fitted with a spray shield of canvas or a "buggy-top" sun and rain shield. Larger boats are protected by an awning top carried on a frame overhead, or by a fixed "standing-roof" which is commonly fitted with side curtains of canvas, making a weather-tight inclosure, but dangerous in a high wind. Boats 25 to 30 (or more) feet in length usually have a cabin of some sort. This may be of the "raised deck" or "hunting cabin" type, inclosing the bow for several feet back, or a "glass cabin" inclosure toward the middle of the hull. The last is liable to make the boat top-heavy unless it has considerable width of beam.

At the Paris Exposition of 1889 there was exhibited a boat with a Daimler motor, this being among the first of the motor boats. As this form of motor was developed and improved for automobiles and aeroplanes, manu-

the gasoline launch, commonly 20 to 30 feet long; (2) speed boats, sometimes called displacement speed boats, more or less decked over and with high-powered engines: they often run up to 40 feet in length; (3) hydroplane boats, having stepped planes in the hull and designed to slide on the water rather than through it; (4) cruisers, virtually pleasure yachts, using gasoline motor engines instead of steam engines and usually built with a view to speed. These last are commonly 60 to 100 or more feet in length, and they carry engines

facturers adapted it to boats, and the internal combustion or gasoline engines built for motor boats are quite as efficient as those constructed for automobiles and motor vehicles. Not having the same weight restrictions, they are usually of heavier construction, and they are built up to large sizes. As arranged for motor boats, the internal-combustion engine is simpler than for automobiles. No radiator is required to cool the cylinders, the water-jacket of the cylinders being supplied by a continual current of fresh water taken in from beneath the hull;

and no change-gear for various speeds nor differentials are needed. The engine may be direct-connected to the propeller-shaft. Motors of two to six cylinders are in common use. In small boats the gasoline or fuel tank is placed forward to get it high enough to feed the carburetter by gravity. The exhaust is carried to a water-cooled muffler and thence outboard. The crank-shaft is run fore and aft and is coupled to the propeller shaft. The latter has thrust-bearings with steel balls to relieve the friction. The propellers are made with two or three blades and special forms of spiral blades are made for shallow and weedy water. Some 20-foot motor boats are made to run in one foot of water, the propeller being placed in a tunnel in the hull. Some propellers have adjustable blades, which can be positioned so as to rotate either right-hand or left-hand, though the driving is in one direction. This adjustment therefore fits the boat for either forward or backward motion. The more common method, however, is to have the propeller-shaft geared to the engine by a lever-operated reversing gear.

A familiar type of six-cylinder internal-combustion engine for motor boats is shown, in the diagram. The cylinders are cast in pairs and placed upright, as in an automobile, with

the two-cylinder two-cycle motor having the same effective power as the four-cylinder four-cycle motor. For the ordinary motor boat an engine is better than the three-cylinder two-cycle motor. It runs with a minimum of vibration, and is of less dead weight for the power developed than any other. The ignition system is another fundamental feature upon which the motor boat operators and builders divide opinion. The two systems in use are the make-and-break, and the jump-spark systems. Few who have had a serious amount of experience with both will hesitate to choose the make-and-break as the easiest to get along with in a circumstances. Most motor builders recognize this condition, and nearly every make of motor may be had with either system. Cabin motor boats, as a rule, are equipped with a storage battery, and a generator attached to the propeller shaft to keep it charged, thus providing the boat with a lighting system, and affording current for a searchlight to aid the pilot in making landings after dark.

Rowboats, canoes, dories and other small craft may be turned temporarily into motor boats by attaching to them a portable detachable motor made for such purpose. These little engines range from one horse power upward and are provided with one or two cylinders, the

Diagram Illustrating the Principle of a Hydroplane Boat.

the inlet pipes on one side and the exhaust on the other. The crank-shaft is cased in below. At one end is the fly-wheel, the reversing lever at the other. A 12-horse-power engine in a 30-foot boat may drive it 10 miles an hour or more; with 20-horse-power, 16 to 18 miles may be attained. Racers with 30 to 60 horse-power motors make 30 to 35 miles an hour, meaning in each case statute miles. Over considerable distances the speed shown is much less. For instance, in the Philadelphia-Havana 1,200-mile ocean race in 1910 the winner averaged less than eight miles an hour.

The small open boats employ mostly engines with one or two, and occasionally three cylinders. In these small engines the bore and stroke are about the same. In the larger engines, the stroke usually exceeds the bore by 20 to 30 per cent. The displacement speed boats commonly employ four-cylinder to eight-cylinder engines, while hydroplanes are built with four- to six-cylinder engines, up to 65 horse power or more. The large cruisers commonly install several motors tandem to get the desired horse power. In small boats the usual motor is of the two-cycle type; in the larger boats the four-cycle type is common, but by no means universal. The four-cycle motor is more economical of gasoline, and from a mechanical point of view is superior as a machine, but it is much more complex than the two-cycle motor, and is nearly twice the weight—

latter type being more dependable. The motor is self-contained, and is simply clamped upon the stern board of the boat. It will drive an ordinary round-bottom rowboat six to seven miles an hour.

The hydroplane boat is of a distinct type having a flat bottom or hull in the first instance then a step being introduced in the hull, this being called a biplane hydroplane. This step construction involved a division in the bottom or hull, so that the forward half was a "step" lower than the aft half, this step being perhaps two inches high. This worked well, and the multiplane or multistep type was introduced and generally followed, as securing the best results. In its natural position the first plane of the hull is on the water level, and as the boat gathers speed the bow rises, and the entire boat is more or less lifted out of the water, tending to skim on top instead of to drag through the water, like other boats. But in order to rise upon the surface the speed must be very great—a slow boat will not "plane." The highest authentic record up to 1 Jan. 1918, is that of the *Whip-Po-Will* which averaged 69.39 miles per hour for six one-mile spurts on Lake George 6 Nov. 1917; and made its fastest mile in 51.5 seconds—a rate of 70.15 miles per hour. In July 1931, K. Don in *Miss England II* made a world record of 110 miles per hour over the Lake Garda course.

Motor boat races are held regularly

MOTOR BOATS

20-foot runabout with passengers seated ahead of the enclosed engine. With an engine the size of those in bibles, such a boat is capable of speeds around 40 miles per hour. Upper center: A three-point racing hydroplane, all after cockpit is dwarfed by the midship space for a special racing engine which drives this 20-footer at close miles per hour. Lower center: An outboard-powered, round-bottom boat providing inexpensive boating at speeds 30 miles per hour. Bottom: A 32-foot cabin cruiser with sleeping accommodations for four persons and a top speed in the range of 15 to 20 miles per hour.

The hull shapes used in power boats vary widely. Top: Cross sections which may be recognized, left to right, as typical of the flat-bottom rowboat, the cruiser, and the fast runabout. Center: Side and bottom views of a step hydroplane, a type used mainly for racing. Bottom: Side and bottom views of the three-point hydroplane, the fastest of racing hulls.

Monaco and many European water resorts; also in the United States, on the Hudson, off Marblehead, off Block Island, on the Mississippi and the Great Lakes. In the 1930 Harmsworth Trophy race held at Detroit, Gar Wood's entry, *Miss America IX*, was the winner, with a speed of 77.39 miles per hour. The winner of the American Power Boat Association's challenge gold cup in 1931 was *Hotsy Totsy*, owned by V. Kleisrath, averaging 53.59 miles per hour. Consult Durand, W. F., 'Motor Boats' (London 1907); Hobbs, E. W., 'Model Power Boats' (London 1912); Russell, T. H., 'Motor Boats: Construction and Operation' (Chicago 1910); Verrill, A. H., 'Book of the Motor Boat' (1916); Burnham, B., 'Outboard motor boats and engines' (1930).

MOTOR CAR. See AUTOMOBILE.

MOTOR CYCLE, a two-wheeled vehicle resembling the bicycle, propelled by an internal combustion engine slung in the frame between the wheels. The operator sits astride the frame on a saddle and steers the vehicle by handle-bars after the manner of the bicyclist. The engine, now usually of two-cylinders, is air-cooled. The power is conveyed to the rear through a transmission gear box by a shaft or sprocket chain. The later models of these machines dispense with the pedals which were employed to start the engine in the earlier machines. The right foot-rest of the modern machines carries a toothed sector used to turn the engine shaft in starting. Control and operation are analogous to those of the automobile.

MOTOR FUELS. See CHEMISTRY, PROGRESS OF; INTERNAL COMBUSTION ENGINE; SUBSTITUTE MOTOR FUELS.

MOTOR SHIPS, the large vessels which use their fuel for generating power directly in the engines, as distinguished from steamships, which generate their power in boilers. While the motor boat also uses an internal combustion engine, the type is generally that of the motor vehicle, and the fuel is one of the lighter fractions of petroleum. The development of the Diesel and Diesel-type engine using a fuel of lower grade has made possible the use of such motive power in large units. The initial cost of these units is high in comparison with steam power installation but operating costs are reduced and cargo space increased. In 1930 motor ships for the first time exceeded in tonnage all other types of ships launched throughout the world. The total of such launchings was 1,582,994 gross tons, of which the United States was credited with 71,854 gross tons. The great bulk of tankers launched that year were of the motor ship type; some of these are of as much as 16,000 gross tonnage. In 1929 there were 294 motor ships in the merchant marine of the United States with 566,321 gross tonnage. Among ocean liners the Italian *M. S. Augustus* is notable for its size and equipment. It is 710 feet in length and has a gross tonnage of 32,650. It is equipped with four Diesel engines of the M.A.N. double-acting two-stroke type operating at a normal speed of 120 r.p.m. Each engine operates one of the four screws. The total shaft horse power is 28,000. The speed of the ship is 20.75 miles per hour, and fuel consumption about 120 tons per day. Auxiliary machinery, except that for the main engines, is installed

in separate spaces. The boiler installation is used mainly for supplying steam to the thermo-tanks, for cooking and general heating. The *Augustus* was built primarily for the South American trade.

MOTOR TRUCK. Through the ages man has sought new means to promote the economical movement of commercial commodities. His observation of the rapid development of the automobile for pleasure purposes turned his thoughts to the advisability of adapting this new creation to his business needs. First came the automobile, then the bus for larger groups of passengers, and then the motor truck for various commercial purposes.

Design.—The mechanism of a truck is similar in principle to that of an automobile (see AUTOMOBILE), the exceptions being that the component parts are designed heavier to enable them to perform economically the heavier type of service that they will be called upon to meet. Passenger automobiles, if converted into commercial vehicles, to operate economically should immediately be fitted with an oversize water pump, fan, clutch, tires, and a lower final gear ratio. The pay load that may safely be carried upon such a unit should depend upon the tire-carrying capacity. Passenger car units, engine transmission, universal axles, etc., comprise the structure of many light commercial vehicles, namely up to 1½-ton capacity or gross weight of 14,000 pounds. The manufacturing volume created by such a program enables production costs for both complete units to be lower, an economic fact that contributes to lower first cost for both the passenger car and truck models involved. Larger motor truck parts are made proportionately stronger and are fitted with numerically low transmission and rear axle ratios to cope with the terrain and road conditions they are to encounter.

Heavy Duty Units.—Some manufacturers build models which, when fully loaded, weigh 60,000 pounds or 30 tons. These chassis, as built by different manufacturers, vary in weight as much as 2,000 pounds and run between 11,000 to 13,000 pounds. Between the light and heavy-weight limits are found many types of chassis and styles of bodies, built to meet a wide variety of business, highway and terrain conditions. One will find 3-4-6-8 and multiple-axle vehicles, tractors, semitrailers and trailers. Some trucks have a single axle two-wheel drive, others four- and six-wheel drive, while still others have a multiplicity of special features to particularly adapt them for a given piece of work.

Definitions.—All forms of commercial vehicles which the public encounters upon the highways are usually classified by them as trucks. However, there are certain basic differences in designs that enable transportation men to select types for performing given operations. The range of designs employed created confusion on the part of regulatory and licensing bodies which resulted in the Society of Automotive Engineers adopting the following for purposes of classification:

(1) *Motor Truck*—A single self-propelled unit carrying its own load.

(2) *Tractor Truck*—A single self-propelled unit provided with a fifth wheel for a semitrailer and with or without a body for carrying its own load.

(3) *Semitrailer*—A unit drawn by a tractor truck by means of a fifth-wheel connection.

(4) *Trailer*—A unit drawn by a truck or tractor truck and entirely sustaining its own load.

SEMI-TRAILERS

TRACTOR TRUCKS

FULL TRAILERS

Types of Commercial Motor Trucks.

A motor truck derives its power from the following sources: gasoline; Diesel; steam engine; or electric motors.

The internal-combustion engine requires no auxiliary means to generate steam or electricity, such as a boiler or charged batteries. It therefore lends itself to fundamental considerations that are a necessity in successful motor truck operation, namely, simplicity, lower initial weight, and reliability, reasons that have resulted in the gasoline engine predominating today. Steam has become obsolete in America, although in England for reasons of national defense it is used to some degree.

Progress.—Progress in application was slow (as statistics will show) until the 1914-18 World War stimulated the military forces of the Allied groups to place huge orders for trucks with various manufacturers throughout the United States. The governments of the world allocated millions of dollars to experimental work, and around given specifications were built the better performing and more reliable vehicles, such as the U. S. Liberty Truck. Knowledge gained at that time of engineering and operating problems gave the industry courage to proceed with the adaptation of this vehicle to the replacement of horse-drawn vehicles. With the advent of pneumatic tires, which replaced solid tires, its reliability and speed were increased to a point where its economic advantages

enabled it to compete successfully with other established forms of transportation.

Adaptability.—The relative advantages of motor carriers while in competition with rail carriers is fully discussed by Joseph Eastman in «Coordination of Motor Transportation 182 I.C.C. 263-300-309.» He summarized the advantages of trucks as follows:

«The advantages of truck transportation from a service standpoint are to be found mainly in the speed, the completeness and the flexibility of the service rendered. The area in which the truck has most effectively supplanted rail traffic is that which can be served one or more times during the day; the area within which overnight delivery can be made is a fertile field for the truck; to points more distant the service advantages of the truck are lessened until a zone of indifference or disadvantage is reached. Coupled with this phase of service is the ability or willingness of truck operators to take shipments at a later hour than the railroads ordinarily do and yet make earlier morning delivery.

«In the case of some shippers an even greater advantage of truck transportation is the completed service it renders. Only one transportation agency needs to be dealt with for given shipments and pick-up and delivery service is usually provided. There is also more flexibility about truck than rail service in moving emergency and irregular shipments. Special efforts are made to meet any unusual requirements of an industry or a shipper. Secondary factors favoring truck transportation are the more personal contacts between shipper and truck representatives than prevail between shipper and railroad, the less formal procedure, and, in some cases, the possibility of combining selling with transportation functions.»

Another extreme is represented in the handling of agricultural products. The New Jersey Agricultural Experiment Station Bulletin No 503, page 21, states that in a survey attempting to determine the advantages and disadvantages from the standpoint of the producers and dealers in the market, the following advantages were determined: (1) faster service; (2) convenience and labor saving; (3) better condition of product on arrival; (4) earlier delivery to market with maximum time for preparing shipments; (5) greater opportunity for diversion of products; (6) less loss for shortage and damaged packages; (7) promptness in payment of claims; (8) lower transportation costs in local territory; (9) agreements to pay for loss to early market; (10) return of empty crates; (11) increased sales to retailers; (12) intimate touch with market through truckman.

The disadvantages were as follows: (1) lack of advance market information; (2) absence of proper regulation of responsibility of operator, regularity of schedule and standardization of rates; (3) necessity for immediate sale or storage; (4) terminal market congestion; (5) rising transportation charge with increasing distance; (6) lack of opportunity for shipping point inspection; (7) interrupted service resulting from unfavorable weather; (8) miscellaneous disadvantages such as breakdowns, lack of insurance, and delay in market.

These reasons, while developed in a survey of the New Jersey and New York market areas, are equally applicable to other geographical locations where farm products are handled.

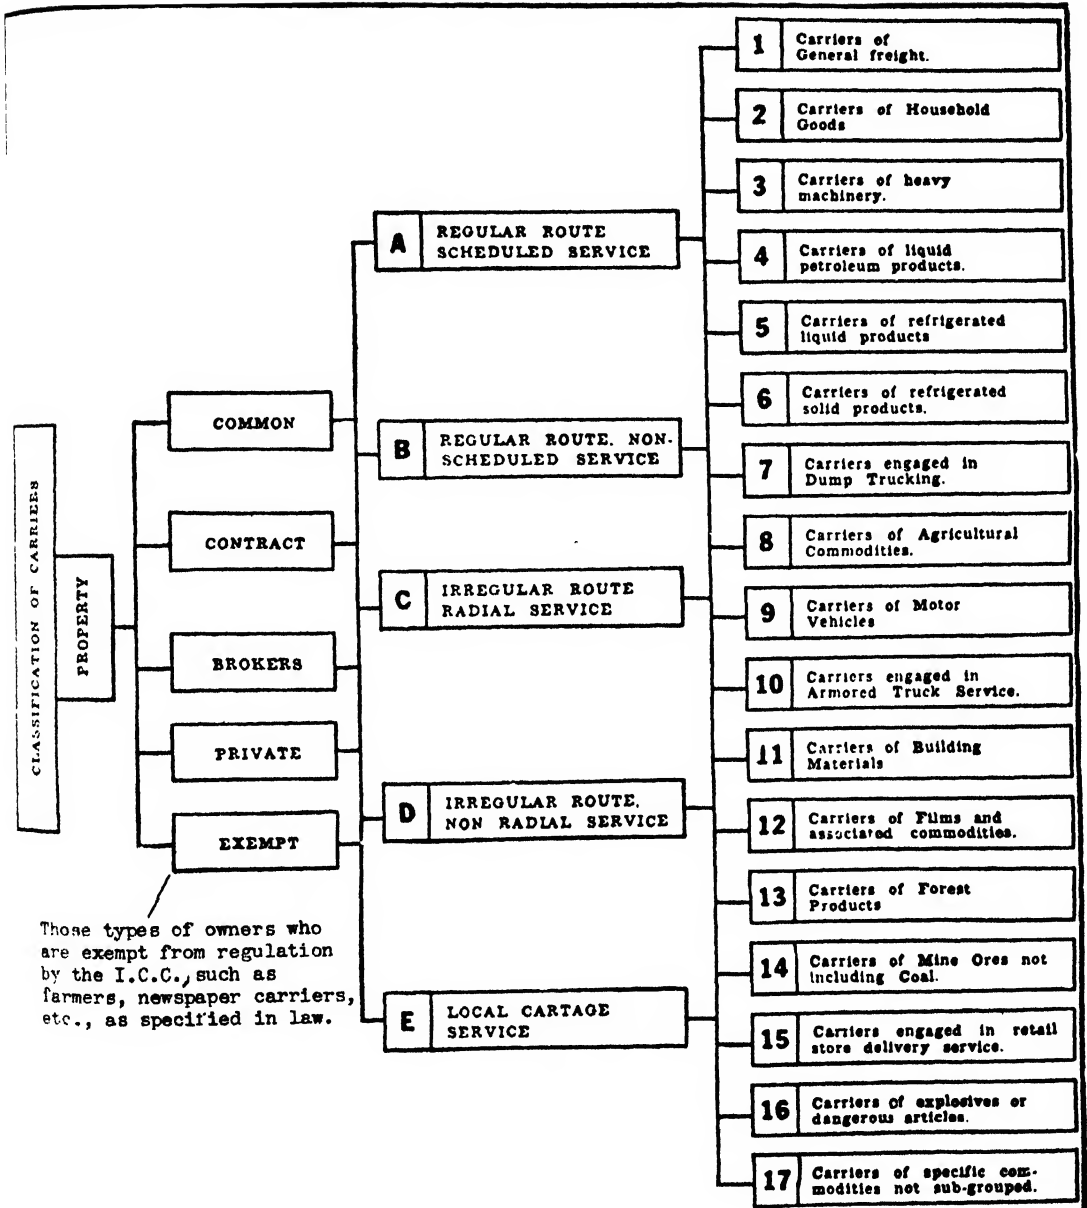

Chart formulated by the Interstate Commerce Commission showing the subdivision of the motor truck industry.

Profitable applications resulted in a rapid growth of highway transportation, and with this came a demand for regulation. For the purpose of classification for regulatory reasons, the Interstate Commerce Commission made a study of the classes of owners, the types of routes they covered, and classified industry branches that motor trucks were working in. A chart formulated by that organization gives the following subdivision of the industry in its many ramifications.

Selection.—The wide variety of vocations that such equipment is employed in necessitates many models; proper selection for each type of work is a necessity to make it a dividend-paying investment. This problem calls for co-operative effort on the part of the truck designer and the transportation engineer who, as the purchaser, has a detailed knowledge of the conditions it will be called upon to meet as a transportation unit or special tool. The four main considerations that apply to application of vehicles are: (1) adaptability to the work; (2) reliability; (3) comparative economy; (4) conformity to legal requirements.

Adaptability covers two main requirements: first, that of the chassis. It must be easy to handle, have proper traction, proper ability, suitable speed and brakes, coupled with details in cab design to promote driver comfort or no undue fatigue. The second requirement covered by adaptability is suitability of chassis for adapting to it the many special devices that are employed as auxiliaries in various industries, such as power take-off to operate dump bodies, pumps, hose reels, fire-fighting apparatus, oil-field drilling equipment, etc., and apparatus for trailer or semitrailer applications. A chassis should be as light in weight as possible and should have an appearance that will enhance its advertising value.

Reliability.—This is created through quality of design, materials of construction, and workmanship. Proper study of items under adaptability create reliability; also, financial stability of the manufacturer and his distributors plays an important part here, for repairs are the inevitable result of continued operation. Lack of proper service facilities and spare parts carried in strategic locations results in loss of time, upset schedules, etc.

Economy.—This is important. From the moment a unit is placed in service, the following items are encountered: depreciation, fuel lubricants, interest on investment, license fees and taxes, repair cost, and an operator's wage scale that constitutes 45 per cent to 50 per cent of the over-all cost. A few hundred dollars spent on the original investment to promote reliability may save thousands throughout the life of a given unit on the above item.

Legal Requirements.—We have national, state, and municipal laws, and enforcement bodies to enforce them. The more prominent of these bodies are the Interstate Commerce Commission (national), and the State Commissioner of Motor Vehicles, Public Utility Commission and State Police, and the Port of New York Authority Force; then come the local municipal police and other special men, such as peace officers, park police, etc. Specifically, the items that have to be met to obtain a license and operate within the law are the following: proper lighting equipment, safety devices, tire

sizes, over-all dimensions and weight requirements in various forms.

Motor Equipment Use as Auxiliary Tool.—The modern community employs motor equipment for snow removal, or for fire-fighting apparatus, for garbage and ash handling, etc., while public utilities employ such equipment to perform operations to supply gas, electricity, or telephone services. Among the special services in the latter industry are the following: (1) pulling cables in conduits; (2) digging post holes; (3) derrick devices; (4) handling materials on and off trucks; (5) special concrete or asphalt breaking devices to cope with modern city streets. As a functional device its use has spread into the oil industry, state highway departments, and many other branches of organized business. Labor-saving devices are the demand of these times; motor trucks contribute to rapid completion of many specialized operations at a reasonable cost.

Modern Community Life.—The home owner seldom visualizes the widespread use of the motor truck in relation to his well-being. It transports the materials that his home is constructed of, the fuel that keeps it heated, the commodities that enable him to exist—milk, vegetables, meats, etc.—and which are handled with a flexibility and swiftness of service that contribute to a family's health and comfort. Motorists at times find fault because motor trucks slow them up when on the highway, and are apt to be critical and agitate for restrictions with high license fees. If they will study the economic advantages which they as citizens gain from this modern device, they will find that its contribution to low-cost transportation, from which they benefit, far outweighs the inconvenience and annoyance they may encounter.

Present trends are toward uniformity of laws as regards sizes and weight, toward axle loads instead of gross-weight laws, better lighting equipment, compulsory inspection, uniform licensing laws, strict federal regulations on interstate movements by the Interstate Commerce Commission, and lighter chassis and body weight in relation to pay load and higher-speed vehicles.

JOHN F. WINCHESTER,
Manager, General Automotive Division, Standard Oil Company of New Jersey; Member, Society of Automotive Engineers.

MOTORS IN WARFARE. See MILITARY SCIENCE; MILITARY TRANSPORTATION.

MOTRIL, mō-trēl', Spain, town in the province of Granada, somewhat over a mile from the Mediterranean Sea. It is in itself a port but the anchorage harbor, Calahonda, to the southeast, is more important. The climate is very mild and its industries consist of sugar plantations, wine-culture, sugar mills; cotton also is grown to some extent. There are also iron foundries, soap works, etc. Pop. 18,444.

MOTT, Alexander Brown, American surgeon: b. New York, 31 March 1826; d. Yonkers, N. Y., 12 Aug. 1889. He was educated privately by Professor Darling of the University Medical College and at Columbia College Grammar School, then (1836) went to Europe for five years continuing his education. Although a Quaker he entered West Point, resigning at his father's desire and became secretary to Commodore Morris in United States naval quarters on

the Mediterranean. He next took up commercial life (1845) visiting Turkey, Greece, Italy and Austria for a Marseilles firm. Continuing the study of medicine at Havre, he returned to New York and was graduated (1849) at New York Medical College, at the University of Pennsylvania (1850) and Castleton Medical College. In 1853 he became visiting surgeon at Saint Vincent's Hospital and was attending surgeon (1855-63) to the Jewish Hospital. He was one of the founders of Bellevue Medical College. During the Civil War he was medical director (1862-64) at New York and (1864-65) inspector of the department of Virginia and was mustered out of the service in 1866 with rank of brevet-colonel. From 1872 he was professor of clinical and operative surgery till his death at Bellevue Medical College. He wrote 'Surgical Operations' (1856-57); 'Advantages of Clinical Teaching' (1868), and other works.

MOTT, James, American abolitionist: b. Cowneck, L. I., 20 June 1788; d. Brooklyn, N. Y., 26 Jan. 1868. He was a teacher in a Friends' boarding school in Dutchess County, N. Y., at 19, where he later married Lucretia Coffin. In 1810 he went to Philadelphia, Pa., and engaged in mercantile business. He was a staunch friend of William Lloyd Garrison (q.v.), assisted in the organization of the Philadelphia Anti-Slavery Society in 1833 and attended as a delegate the World's Anti-Slavery convention in London in 1840. He was a determined supporter of the cause of woman's rights and in 1848 presided over the first woman's rights convention at Seneca Falls, N. Y. From 1865 till his death he became interested in the foundation of Swarthmore College.

MOTT, John Raleigh, American Y.M.C.A. leader: b. Livingston Manor, N. Y., May 25, 1865. Graduating from Cornell University in 1888, he was made chairman of the executive committee of the Student Volunteer Movement, a post he held until 1920. In 1888 he also became student secretary of the International committee of the Y.M.C.A.'s, being promoted to general secretary in 1915. He served as general secretary of the National Council of Y.M.C.A.'s in the United States until 1928, and after 1926 was chairman of the World's committee of Y.M.C.A.'s. He was general secretary of the World's Student Christian Federation from 1895 to 1920, when he became chairman. In 1910 he took part in the founding of International Missionary Council in Edinburgh, Scotland, and was its first president and held a chairmanship from 1920 to 1941. In 1916 he was appointed a member of the joint commission for settlement of differences between Mexico and the United States, and was a member of the special diplomatic mission to Russia the next year. On Nov. 14, 1946, he was selected as cowerner of the Nobel Peace Prize, sharing the award with Emily Greene Balch (q.v.). He is the author of *Cooperation and the World Mission* (1935).

MOTT, Lewis Freeman, American educator: b. New York, 29 Sept. 1863. He was graduated B.S. from the College of the City of New York in 1883; took his M.S. there in 1886, and his Ph.D. at Columbia University in 1896. He was professor of English at City College from 1907 until he retired in 1934. He was a member

of several learned societies, and published 'The System of Courtly Love' (1894); 'The Provençal Lyric' (1901); 'Ernest Renan' (1921); 'Sainte-Beuve' (1925). He edited *City College Quarterly*, 1906-28. France made him a chevalier of the Legion of Honor in 1932. He died in New York City, 20 Nov. 1941.

MOTT, Lucretia Coffin, American abolitionist and woman's rights advocate: b. Nantucket, 3 Jan. 1793; d. near Philadelphia, 11 Nov. 1880. With her parents, Thomas and Anna Coffin, she removed to Boston in 1804, and two years later became a pupil in a Quaker boarding school at Nine Partners, N. Y., where James Mott (q.v.), whom she subsequently married was a teacher. In 1817 she opened a small school, but soon gave it up and became recognized as "an acknowledged minister." She joined the Hicksite branch of the Quakers upon the schism of 1827. In 1833 she joined in the formation of the American Anti-Slavery Society, as whose delegate she went to the London World Convention in 1840, from which all women were excluded. The result was the woman's rights movement, in which Mrs. Mott became a leader, taking a prominent part in establishing the convention held at Seneca Falls in 1848. Consult Hallowell, A. D., and 'Letters of Lucretia and James Mott' (1884).

MOTT, Valentine, American surgeon: b. Glen Cove, L. I., 20 Aug. 1785; d. New York, 26 April 1865. He was graduated (1807) at Columbia College when he went to England to continue his studies in medicine at the post-graduate courses of London and Edinburgh. In 1809 he returned to New York and was given the chair of surgery at Columbia College, continuing to hold the position when Columbia College was merged with the College of Physicians and Surgeons. In 1826 he with the entire body of his colleagues resigned on account of offensive actions of the trustees and they founded Rutgers College. The latter institution, in 1830, had to close from defects in its charter and he returned to the College of Physicians and Surgeons as professor of operative surgery and surgical and pathological anatomy. Ill health caused him (1835) to resign to visit Europe twice, finally returning in 1841, after having gained high honors for work done in the old country. He was elected president of the medical faculty of the University of the City of New York while still practising as surgeon in New York Hospital, till 1850 when he spent a year in Europe. In 1851 he was appointed professor of operative surgery and surgical anatomy again at the College of Physicians and Surgeons for a year when he resigned and was made emeritus professor for the rest of his life. On his death his fine library went to New York Academy of Medicine. He gave but little time to literary composition, one of his most extensive works being his 'Travels in Europe and the East' (1842). He supervised a translation of Velpeau's 'Operative Surgery,' writing its preface. In 'Transactions' of the New York Academy of Medicine were published numerous addresses and lectures. He also wrote a 'Sketch of the Life of Dr. Wright Post' and a 'Eulogy on his friend Dr. John Wakefield Francis' (1861). 'Mott's Cliniques' (1860) is an abstract of his later clinical lectures.

Consult Gross, S. D., 'Memoir of Valentine Mott' (Philadelphia 1868).

MOTTIER, môt'yêr, **David Myers**, American botanist: b. Patriot, Ind., 4 Sept. 1864. He was graduated (1891) at Indiana University, then took the Ph.D. degree at the University of Bonn in 1897 and at Leipzig in 1898. He was (1891-93) instructor of botany at Indiana University and associate professor (1893-98), then professor from 1898. He was elected president of the Indiana Academy of Science in 1907. He has written 'The Practical Laboratory Guide for First Year in Botany' (1902); 'Fecundation in Plants' (1904); 'College Text-book of Botany' (1929); and technical papers.

MOTTLED OWL, a small horned owl (*Megascops*, formerly *Scops*, *asio*), which, in one or another geographical variety, occurs numerously all over the continent, except in the colder parts of Canada. Very similar species are known in Central America and in Japan. It is only 9 or 10 inches long, with large facial discs, two small erectile horns and a short rounded tail. Its plumage is a mottling of gray and rust-red. These little owls are nocturnal and are almost blinded by daylight glare. They come out in the dusk of evening, and from sunset to darkness, or all night when the moon is shining, is heard their low, musical, trilling cry—one of the pleasantest of bird voices; yet in some evil way the name *screech-owl* was long ago fastened upon this bird. Its eggs are five to seven, pure white. The food of the mottled owl is chiefly small rodents and insects, and occasionally, in spring, small birds; they destroy a vast number of insects and mice hurtful to the farmer and gardener. Books upon American birds abound in facts as to their habits.

MOUCHEZ, moo-shā, **Amédée Ernest Barthélemy**, French astronomer: b. Madrid, Spain, 24 Aug. 1821; d. Wissous, France, 25 June 1892. He was educated in the French Naval Academy and remained in the navy until 1878 when he was appointed chief of the National Observatory. He had previously shown himself a brilliant scientist and particularly distinguished himself in coast surveys of Algeria and Brazil as well as in the observation of the transit of Venus in 1874. He bent all his energies to the improvement of the observatory, introduced several innovations of value, and was the originator of the international photographic chart of the heavens. In 1880 he was appointed rear-admiral. He wrote 'Côtes du Brésil' (1869-76); 'La Photographie astronomique et la carte du ciel' (1877); 'Rio de la Plata' (1873; 3d ed., 1891).

MOUFLON, moof'lôn, or **MUSIMON**, a wild sheep (*Ovis musimon*) of Corsica and Sardinia, where it wanders about the summits of the mountain ranges in small flocks, and offers excellent sport. It is a question whether this species ever existed on the mainland, one opinion being that it arose in the isolation of the islands; but most naturalists believe that it formerly existed in Spain. The rams are about two and one-quarter feet tall at the withers, and have very large coiled horns, but the females are hornless. The long mane-like hair that covers the neck and chest of the rams is gray, but the remainder of the coat is mainly

rust-red above and white on the ventral surfaces. A similar "mouflon" inhabits Cyprus, and the Barbary aoudad (q.v.) is often called "ruffed mouflon." Consult Afialo 'Sport in Europe' (London 1901).

MOUKDEN. See **MUKDEN**.

MOULDING or **MOLDING**. See **FOUNDRY PRACTICE**.

MOULDS. See **FUNGI**.

MOULE, mool, **Handley Carr Glynn**, English bishop: b. Dorchester, Dorsetshire, 1841, d. 8 May 1920. He was educated at Cambridge University, took orders in the Anglican Church, and was an assistant master at Marlborough College 1865-67. From 1873 to 1876 he was dean of Trinity College, Cambridge, and he was first principal of Ridley Hall, Cambridge, 1881-99. He was nine times select preacher at Cambridge and once at Oxford, was Norrisian professor of divinity at Cambridge 1899-1901, and in the last-named year was consecrated bishop of Durham, succeeding Bishop B. F. Westcott (q.v.). He has published many devotional and expository works, among which are a series of commentaries on the Epistle; 'Thoughts on Christian Sanctity'; 'Ephesian Studies' (1900); 'The Secret of the Presence' (1900); 'Thoughts for the Sundays of the Year' (1901); 'The School of Suffering' (1905); 'Christus Consolator' (1915); 'The Call of Lent' (1916).

MOULIN, an opening from top to bottom of a glacier, by means of which a stream flowing on the surface of the ice plunges to the bottom and flows on as a subglacial stream.

MOULIN ROUGE, moo'lân'roozh, Paris, the "Red Mill," noted dance-hall on the right bank of the Seine, in the Montmartre district. After the notorious Jardin Mabille, in this section, went out of existence the Moulin Rouge became the favorite resort for can-can and other gay dances of the Parisians.
